of a covey of quail. He places "fun" above the comforts of a home; why? Because in a little while he wants the "fun" of running his coat tails off in trying to get out there ahead of some other sportsman, that he may have the enjoyment of wounding, tearing and pounding them to death with powder and shot. This is what makes the farmer a cold-blooded, narrow-minded, despised brute, and the city sportsman a "gentleman." God made rattlesnakes, centipedes and pole-cats, and when they interfere with the peace and welfare of the farmer he is expected to kill them; why? Because in doing the same thing there would be no "fun" for Podgers.

I suppose that sportsmen made the great blue heron that they are now exterminating up in Maine, for now and then taking a fish from a trout stream, as do also the kingfisher, fish-hawk and several other kinds of birds. Why are they doing so? To save a few trout to have fun with in killing them. There is nothing selfish in human nature, and especially sportsmanship. Oh, no. The great blue heron, in my estimation, is one of the grandest of American birds. If I could not see these noble birds along the wild shores of the forest lake or river, watch and hear the kingfisher in its flight, and see the fish-hawk dive beneath the water, but little of the charm of a fishing trip would remain for me.

Farmers are not destroying the game in this country, and that assertion which is now and then made by sportsmen is untrue. It is hunters, dogs and guns that are doing this thing, and the hunters that will spend from \$50 to \$500 in going to distant places, and in a short time kill hundreds of heads of game, can be relied upon as having a hand in its being wiped out of existence at home. I do not know of a farmer that owns a hunting dog, yet you cannot go into a city or town in this Western country without tumbling over those kinds of dogs.

My experience leads me to believe that one may travel from the daisy-covered hills of New England and the Curruck marshes in the East to the golden-rod prairies of the West, and from the prairies to the mountains, and from the mountains to the sea; one may wander from the Chilkoot Pass and the mastodon pastures in the distant North to the turkey roosts in Texas, and when he has met with twenty hunters one may possibly be a farmer.

Farmers love the birds and the game around them for the wild life and beauty they see in them. Sportsmen love them for the fun they can have in taking their lives from them. The farmer side of my nature is more humane, generous, manly and sympathetic than the sporting side of it, yet I glory in both, and can hold both sides up to the view of any class of people in this land or any other without a blush.

I started out to make a little explanation to brother Von, but I see that I have sprawled very much all over the country—and still live.

It may be that I owe brother Von an apology. I hardly see how. But if he will accept of one I will extend it with more grace and good feeling than could hardly be expected to come from an "alligator."

MOUNT TOM.

In the Rockies.—II.

A four weeks' hunt in the Rocky Mountains as narrated by Dr. David McReynolds and written by Alfred B. Wingfield.

(Concluded from page 106.)

It was now the 26th of October, and it had been several days since Calloway killed his magnificent elk. The boys had hunted with great zeal, but they had made a solemn pledge among themselves not to kill a female or young animal on the trip, and they had been unsuccessful in bringing to bag any more bulls. However, Wilson succeeded the next day in killing a fine blacktail buck, which weighed nearly 300 lbs. and had a beautiful head. This, in some measure, compensated for the loss of the shot on the elk. Several cow and calf elk had been seen, but not fired at, much to the credit of all concerned. This was Calloway's regular hunting ground, and he could not afford to slaughter the game. Grouse shooting and fishing and unsuccessful bull hunting were beginning to grow irksome; so it was decided to move camp.

Oct. 28, early in the morning, all hands commenced to pack and rope the packs on the horses. It had snowed about 2 in. during the night, just enough to make it nasty walking. While Calloway was going over the cinching and adjusting the packs on some of the obstreperous and evil-minded cayuses Scott Pierce picked up his .45-90 and said he would take a turn for exercise, and asked the outfit to wait for him. You know that is always the way; some one gets the notion of hunting just as the outfit is ready to move.

Pierce walked rapidly and was soon in the neighborhood of the spot where the big bull had been killed. He stopped a moment, and lo! over on a hill not a quarter of a mile away he heard the bugle-like notes of a bull blowing off his exhilaration at a high note. Pierce's heart jumped up in his throat and he trotted off toward the call at double-quick time. He was afraid the bull would be gone when he arrived; but he had not gone far when he heard another old bull bellowing defiance at his foe. Pierce stood paralyzed. He was all unstrung. That exchange of harmonics was too much for him. He knew not which way to go. Finally he chose the first bull, judging him to be somewhat nearer than the other, sped softly forward on the cushion of snow, and soon came into plain view of the game. The noble bull stood with bristling neck, and snorting defiance to his rival. Pierce walked up to within 125 yds. of the animal by keeping a bunch of thick fir bushes between the bull and himself.

And the quarry. The bull paid no attention to him. Pierce says it took him several minutes, "it seemed to him," to adjust his Lyman sight. Finally he got it where he thought it ought to be, and leaning against a fir tree, took dead aim at the middle of the bull's body. The rifle roared and the bull jumped, turned and looked at him, trying to make him out. Pierce was excited, and in quick succession pumped four more bullets. Then the animal turned and tore down the hill,

clearing 10ft. at a leap. Pierce stood dazed. His game was gone. He went over to the spot where the bull had been, but not one drop of blood did he see. Disheartened, sick and disgusted he made his way back to the outfit.

The horses were all packed, ready, and Calloway was not in good humor, but he was all aglow, as were all the others, when Pierce related his experience. The outfit moved up to the scene of the shooting, and the tracks were so plain that Calloway said he could kill that bull if the party was willing to camp again. All agreed, and while three of the men and Chang were looking for a suitable place Calloway, Isbell and Wilson took the bull's trail. They followed over hills, down in cañons and across creeks, Calloway following the trail like a timber wolf. Finally both Wilson and Isbell gave out and sat down. They told Calloway to go on if he wanted to go further, and they would go back to camp. Calloway followed the bull about six miles and came up on him and killed him. He was another fine specimen. Calloway now retraced his steps, and finding camp, took Wilson and Isbell and returned to the game. They took several packhorses and brought out the head and all the meat. They were late that night getting back to camp, and got hung up in the fallen timber several times. Calloway says it was rough enough, and the other two men say it was too rough. They thought at one time that they could not get back to camp, but would have to lie out all night on the wet ground without a blanket to wrap around them. However, the moon finally saved them, as it gave them light to see how to get through the bad places. When they reached camp they found a hot supper waiting for them, as the almond-eyed celestial was mortally afraid of Calloway, and would have remained up all night if necessary.

The Chinaman had been giving much trouble the past few nights in crawling into one of the white men's tents after they were all asleep. Chang would get afraid when he heard a wolf howl, and would wrap his blankets around him and crawl in either Calloway's or Dr. McReynolds's tent. In the morning they would find that they had slept all night with a Chinaman. Chang had been threatened so direfully that he was afraid to attempt it again. Upon this memorable night, however, the big log fire burning late into the night attracted a bald-faced owl, which perched directly over Chang's tent. Along about 2 in the morning the owl started—"Ha-ha-ha-who-who-who-a-whoa!"

It was so loud that we were all awake in a moment. Calloway was worn out, but he could not help laughing as he said: "We shall have a visitor in a minute." Hardly were the words out when Chang came crawling under the door-flap, which was tied securely on the inside. His eyes were about to pop out as he stammered out: "Debble! Debble! What he say?" Calloway said, in a serious tone: "Oh, he only said: 'I want you! I want you!'" Chang squatted in one corner, moaning: "Oh, me joss; oh, me joss; debble know me left me joss!" He almost screamed when the owl broke out afresh in its demoniacal laughter. He was so badly scared that Calloway was sorry for him and let him curl up in one corner of the tent and remain there the remainder of the night. It was explained by members of our party who had been living in the West among the Chinese for years that each Chinaman carries in his pocket a small image of wood or stone. He calls this image his joss.

It was decided to remain in this camp for a few days and then cross the divide and go over into the Soldier Mountains and try for sheep. The boys hunted hard to try, if possible, to secure a head of elk horns before leaving the woods. Two of the party already had good heads, as Calloway had given the last head he killed to Wilson, who had hunted so hard with him, and the first head was drawn, by the favor of chance, by John Isbell. Calloway kept the large head himself, which was right, as he killed it, and he was taking his pay in what he killed.

On the third day in this camp Scott Pierce killed a nice blacktail buck, and the next day John Isbell brought one in, both nice heads. Scott Pierce was much elated at his success, and it gave him confidence in himself again. By the way, I should have mentioned the fact that the reason Pierce missed his elk five shots in succession was that he had run his Lyman sight up to 350yds. and was shooting at 125yds.; so his balls all went clear over the elk's back. So much for being excited and not having one's sight marked so as to tell, at a glance, at what range one is shooting.

As we all live and learn every day of our lives, I do not think it would be irrelevant of the subject to state how I have my rifles fixed and how I judge distances. I have two rifles, a .40-70 and a .38-55, both Winchesters. I have trained the sights on a staked rifle range where the distances were measured. I made a scratch on the left side of my Lyman rear sight at 100, 200, 300 and 400yds. I did not make the scratches until I had fired at least fifty shots, at dead rest, at each distance. Then I took the rifles to the gunsmith and had small figures 1, 2, 3 and 4 cut at the scratches made by my knife. Now when in the woods and I set my Lyman at No. 2 I am dead sure I would drive center at 200yds, if I held there. Distances are judged easily and accurately by comparison. I always think of our rifle range, and say to myself: "Now, is that the 100, 200 or 300yd. flag?" and it takes me about the sixteenth part of a second to make up my mind which distance it is. If a person will mark off 100yds. between two familiar objects at home, and get the picture of those objects fastened in his mind, he can easily double or treble or quadruple the distance by eye, and with astonishing accuracy. I am not giving a lecture on rifle shooting; but what is the use or consistency of a tenderfoot spending several hundred dollars to take a Western trip after large game, then to get up to within 125yds. of an elk and shoot at him five times and never touch a hair? Would it not be more profitable for that person to spend \$10 or \$15 for cartridges used at home in training his rifle sights and in learning to use a rifle?

Well, to finish with the hunt. It was now decided that no more game should be killed, as we had all the meat we could possibly pack out of the mountains on what horses we had, but that we would go over to the Soldier

Mountains, whose tops were now white with snow, and try for sheep heads.

We pulled up camp at break of day, and by sunrise were on the way. We crossed the divide between Smoky Creek and South Boise River, and then crossed a small valley and began to ascend the mountains. It was a hard and laborious task to climb those mountains with heavily laden packhorses, but by dividing up all the loads and making use of all the saddle horses as packers we finally reached a bench within 1,000ft. or so of the summit. Here we made camp on a mountain stream and cooked and ate a hearty supper, as all hands, including Chang, were exceedingly hungry.

Next morning we all started to climb up to the summit and see what we could find. We labored up to the top, and some of the boys were inclined to go back, as they said they already had their money's worth. Calloway persuaded them to keep on, however, as he was anxious to have them get some good heads. The top was reached at last, and we explored the crags and crevices, rocks and precipices, but not a sheep did we see. There was lots of sign that looked fresh, and the ground was covered 1ft. deep with snow, excepting in protected places. We hunted quietly and watchfully along the mountain top for a mile or two, and finally crawled upon a big rock and sat down to rest and watch for game. We had not been there long when Calloway's watchful eye located game. We looked and saw a string of big objects filing between two boulders down under us and coming our way. We kept out of sight, and all agreed, at a signal from Calloway, for each man to pick out a ram, as there were several with horns, and all to shoot at once. The signal was given, there was a roar of musketry, and one animal fell; then Hugh Fulton knocked down one with a big head of horns, as they disappeared behind a projecting rock. It seems that Fulton had wisely held his fire and taken more deliberate aim, thus securing a nice head. Imagine the surprise of all to find upon reaching the spot that they were goats, and the one the crowd killed was a nanny goat. Calloway had the dry grins. He said: "Well, boys, if it took all that shooting to kill this poor little nanny goat, I move we go home." The motion was carried, and from that time all energies were bent toward getting home. All were glad to arrive safe and sound again in Boise on Nov. 10, just one month to a day on the trip. Chang especially was delighted, and was well paid and given a good share of venison. Calloway was well pleased, as he was offered \$75 cash for his elk head as soon as he struck town. He refused it and is holding out for \$100, and will get it, as it is an unusually large and fine one. I have now told all there is to tell, and I hope that some of my readers may be able to take a like trip some day.

CHICAGO AND THE WEST.

Art in the City.

CHICAGO, Ill., Jan. 27.—In the street window of the large store room on the lower floor of the building which contains the FOREST AND STREAM office in this city there may be daily seen a curious sight, and one potent enough as an attraction to have retained daily for some weeks a crowd of idle lookers-on. Here daily, from the dark of the morning to the dark of the night, there stands a man, an artist, I presume he is entitled to be called, upon a little pedestal in front of a rough easel, and paints, paints pictures, paints oil paintings by the hour, by the yard, by the mile. He came in there some weeks ago, and already he has painted a room full of genuine oil paintings, to say nothing of very many that have been sold. Of course this artist is in the employ of some concern which does the grosser part of handling the product of his brush. All the artist has to do is to paint a genuine oil painting while you wait, about every five or ten minutes of the day. This man is a curious, preoccupied-looking man, of short stature and no especially ethereal look. His hair is not long, but grows down the back of his neck in determined fashion. He wears a short white jacket in the morning, and it is still short at night. His palette is the top of a store box, and upon it are spread dabs of color in masses of about a quart to each color. His brushes are no dilettante affairs, but sturdy, purposeful ones. No amateurish quality appears in his technique or his method of work. He paints as though he expected to fall dead, and had to get just one more picture done for his family before he went. He paints as a jack rabbit runs after it gets unlimbered. He paints like a thoroughbred coming down a perpetual homestretch; for he is under a top gait not a part of the time, but all the time. The reason for this is apparent. He will paint you a work in oils for the loved ones at home, about as long as your arm and half that broad, for 35 cents. Should you have so much as 85 cents to spend you can get nearly 6ft. of picture. Two dollars, and you will need a dray. Methinks the point of this enterprise lies in the fact that you are asked to purchase your frame for the picture at the room where the pictures are made. The prices of frames are regulated by certain fixed commercial laws. You cannot expect to get frames as cheap as you can get pictures. Frames have an intrinsic worth of their own which no painting can claim. True, we read about the great prices paid for paintings, some of them very old and second hand at that, paintings by such men as Corot, Millet or other Frenchmen who never saw America; or by Rembrandt or Van Dyck, or by a lot of fellows from the south of Europe who would turn over in their graves if they knew what a hit they were making now—a whole lot of these men who couldn't even paint a landscape and had to stick to heads, all of them have been held at inflated values, and the public has been confided about them. Before I discovered my man here in Chicago, a picture not more than 3ft. long and in bad order might be fetching \$100,000. But who would want that sort of a picture, possibly damaged and of doubtful authenticity, when he could come here and get himself a picture twice as large for a few cents, and moreover sit down and see it painted under his own eyes—even, I dare say, though this I have not seen put to proof, with the addition of a cow here, the subtraction

of a tree there, as he himself might prefer. The old masters were autocratic about cows, I am told, and even if they were not, they are dead and can do nothing to improve their work. It is far more practical and modern to do your own art business on the spot and in strictly business fashion. A great deal of money has been wasted lately in second-hand pictures which might have been spent in beautifying homes; but I am glad to see that the common sense of the American people is beginning to assert itself. If you think my discovery isn't doing business, go look at the packages which leave at the back door of his store.

I shall not seek to make fun of my artist, for he is not really the responsible party, and moreover the enterprise supplies legitimately a legitimate demand for large oil paintings at a small price. Moreover, the man is so clever that he disarms criticism. A dab and a rub and you have a sky. A smear, and it's summer clouds. A swipe, and grass has come. Two jabs, and you have rocks. Up and down streak and all hands down the middle, and you have a forest. Wavy wiggle of right hand, and you have the sea. No oil painting is really good without a moon in it. Don't be deceived by any of these old masters. I have been studying this thing, and I know, and my observation is that there should be a moon in any painting entitled to be called a masterpiece. On this point I have almost my only quarrel with my artist. I think that in making his moon he doesn't paint it in at all, but just makes his moon by leaving a white spot with no paint on it at all. I know he is a labor-saving man, but if he makes his moons that way I don't think he ought to charge for them. That is not what we call legitimate art.

So near as I can get at it, the schedule of this artist for his work (for the pictures) is about as follows: Two trees, one castle, four rocks and one moon, 35 cents. (Nothing for a quarter of a dollar, though I think that popular price should be made.) Seven trees, one piece grass, six large rocks, one playfully laughing dog and one moon, 50 cents. Four very large rocks, one ocean, nine angry waves, one shipwrecked vessel, one moon (small), 85 cents. One castle (broken at top), six trees, eight rocks, one overcast sky, one cataract, one maiden, take it along at 98 cents. That is about the scale, but it should not be supposed that this in any way covers the list of topics. I have never seen this man repeat himself yet in all his hundreds of pictures, nor have I ever seen him hesitate for an instant. He has no copy, but he paints by ear altogether. He paints, paints, paints, and always it is some scene of out of doors. In his mind seem always to lie thoughts of wood and sky and rocky hill and rippling stream, or of the ocean and the sky warring or in peace. He does not touch the sordid things of the city, does not attempt the unhappy visages of his fellow-men, but always pours out things reminiscent of the outer air. And he sells them. Therefore may we not see the longing of the city folk for something which shall speak to them, even with thick tongue, of the sky and of the air? At any rate, I am trying to think that, and trying not to believe that people buy pictures to fit an uncovered space of such or such dimensions on a wall or to cover a dust mark left by the pictures of the other tenant when he moved out because he couldn't pay the rent. I am trying to believe that in the brain of this clever man—for he is clever, call him either artist or artisan—there lie thoughts of green fields and happy woods actually known long ago, even though the castles and the moats came out of books. I wonder if under his jacket there does not lie some wish and hope that, after the hurry and harrying is over, he will some day do a picture for himself, and show, for himself, the very spots of out of doors he knew when he was young and when all the world was new and wonderful, with no mud, no dust, no grime, no gaping windowful of folk to watch him image forth his dreams. I should like to know him, but since I do not, I shall hope for him, and hope for the crowds to whom he shows, crudely to be sure, unwittingly perhaps, a changing panorama of things that are good for them to see.

Butter, Butterine and Birds.

CHICAGO, Ill., Feb. 3.—There existed for a number of years on South Water street, in this city, an institution known as the Produce Exchange, an organization of the commission merchants of somewhat complex character, semi-benevolent, wholly commercial and partly ulterior in its purposes—a sort of cross between a commission board of trade and merchants' lunch club—which stood for the common methods and common spirit of our game-dealing thoroughfare. Whenever South Water street wished to appoint a committee to tell the sportsmen of the State what they must do, the Produce Exchange was the meeting place and the head body. Whenever a sportsmen's measure needed watching or required defeat at Springfield, it was the Produce Exchange which stood for solid and united South Water street, which furnished the money needed, in whatever amount. In short, while the matter has never been made public, and while the dealers would perhaps even now be glad if it were not to be made public, the game dealers' lobby at Springfield was really the Produce Exchange. The dealers of this city had long known the value of money and of organization in a legislative fight, and the Produce Exchange made a handsome masked battery for their fight, and one so superior to any the sportsmen could offer that the result of the unequal contest has been no wonder. The Illinois game law has been just such a game law as the game dealers would allow to go on the statute books. This general statement could be made far more explicit, but I fear I might be disliked if I went further into details, although there is plenty of ancient history about game laws, game wardens, etc., lying around loose out here.

At the last session of the Illinois Legislature the Produce Exchange had a grievance, and it was butterine. The commission men deal in fresh country butter (and fresh country quail marked as "butter"), and the very thought of the counterfeit butter made by such large packing concerns as Armour, Swift, Nelson, Morris, etc., made them ill. They resolved to save the public by getting passed a law which forbade the sale of butterine in Illinois. They did have such a law passed, the watchful and trained lobby succeeding against the big

packers, as it had so often succeeded against the sportsmen, the latter not organized and not capitalists.

The result of the butterine law was curious. Some of the large markets, backed by the big packers, have sold the tabooed article without regard to the law. These concerns the pure-butter men have been afraid to tackle, for fear that they will take up a case and get the law set aside as unconstitutional, in which case everybody, both small and timid concerns as well as big and bold ones, would sell butterine instead of butter.

Let us now imagine two large commercial interests arrayed against each other, on the one side the big packers of the Union Stock Yards, on the other the commission men of South Water street; on the one side butterine and deception, on the other pure butter, pure morals, a pure and upright heart determined that the people should not eat butterine so long as the afore-said p. and u. heart could sell them butter. The public knew little of this hostility. There was not much noise or much smoke, but there was a good, big battle, which has been fought during the past fall and winter.

During the past month, a season when the poultry shipments of South Water street to the East should have been at their greatest volume, many thoughtful commission firms noticed an unaccountable shrinkage in their business. The choice farm hen, the husky turkey and the succulent goose did not come in from Waytown as they formerly were wont. The reason for this was not known, but it was known, or might well have been known, by many freight agents situated on the opposite side of the city, at the great Union Stock Yards, formerly held sacred to quadrupeds alone and superior to all biped produce. For the past six weeks or two months in many cars of the dressed beef billed to New York there would be 500, 600, 1,000 lbs. also of dressed turkeys or chickens or other poultry, which had been diverted from a market to which they almost belonged by prescriptive right into a market which would once have scorned such cattle. The truth of the matter was that the big packers, Armour, Swift, Libby-McNeil, etc., had rolled out a few wheelbarrow loads of money and had sent out poultry buyers into the country upon which South Water street is dependent for its supplies. These men have already so far changed the natural and established market that before long we may expect Mr. Armour to advertise fresh omelets in tin, or live spring chicken in canvas. This was retaliation. The packers were getting revenge for the close season on butterine.

The climax of this pretty little commercial fight came the past week. Little by little the business sagacity of the big packers, together with their money, edged into the stronghold of the commission men. Some members of the Produce Exchange were got hold of, and then others. This week the Produce Exchange is disbanded. The packers may be said to have won an initial victory over the pure butter, pure morals party which so long needed to be reckoned with on South Water street, and which so long has said ha! ha! to the sportsmen of Illinois.

The Produce Exchange of South Water street was a legitimately organized institution whose design was to further a certain line of trade. In so far as it clung to that purpose it was a worthy commercial body. Unfortunately, its purposes and performances clashed directly with those of the sportsmen, more especially with the Illinois State Sportsmen's Association, which usually took the initiative in legislative matters regarding game. Therefore, while it is no cause for exultation to see one commercial interest defeat another in a commercial fight, there remains for the sportsmen of this State an incidental cause for congratulation. The arch-enemy of our game is South Water street, and the Produce Exchange was its head and brains. If that acting force be paralyzed, even but temporarily, the game of this State and of all our Western States will not suffer, but will receive benefit. And if at the next session of the Legislature the packers need the aid of the sportsmen's interest, itself not omnipotent, but not inconsiderable, there may possibly be a shifting and adjusting not without its interest. Personally I prefer butter to butterine, and I would rather superintend the architecture of an omelet than to take it ready built out of a tin can; but I would be willing to forego certain pleasures of the palate, as would many sportsmen, could we by this means get a working game law on our statutes, and could we so abolish the great Chicago freezers which are swallowing so steadily the game not only of Illinois, but of the West.

The Interstate Game Law Convention.

Interest grows very rapidly in the interstate convention of workers and delegates which will assemble at Chicago next Monday and Tuesday. It is likely that Wisconsin, Michigan, Minnesota, North Dakota and Illinois at least will have full and earnest representation.

So far as I am advised, the idea of this convention originated with Senator J. Herbert Green, of Milwaukee, who has been very prominent in good game legislation in Wisconsin. At the last session of his Legislature he introduced and gained the passage of a resolution for the appointment of a committee to act with the warden and the fish commission in the direction of uniform legislation in the group of States mentioned above. On his action other State Legislatures have appointed similar committees, all of whom will sit in the central city, Chicago, the coming week.

Senator Green has been sending out letters among some of our Chicago sportsmen asking for expressions of opinion. Col. C. E. Felton, of this city, was thus addressed, and has given me an inkling of his reply. His position I have often frankly criticised before, and did so again to-day. Col. Felton believes in the marketing of game and thinks it can be protected by getting after the man who shoots it and not the man who buys it. In other words, he believes you should destroy a rank and lusty weed by snipping its top branch a little, and not by digging out its root. Let us hope his letter will have courtesy, but not credence or credulity, shown it.

Senator Green, in a journal of his own city, says:

"The opinion prevails in several States that the open season for ducks, partridge, prairie chicken, quail, snipe, woodcock and geese should be deferred to Sept. 15 of each year, or fifteen days later than the season now opens. In some States prairie chickens are killed Aug. 15, but sportsmen tell me that the young birds are un-

able to fly much at that early date, and a month later would provide much better sport. I am also unalterably in favor of stopping the shooting of ducks in the spring, and if Illinois can be prevailed upon to join with Wisconsin in this movement, there is no question but that the practice now indulged in can be stopped by legislation.

"The deer laws of Wisconsin, Michigan and Minnesota should also be identical in order to afford the deer better protection. The length of the present season is all right, but a better license system should be devised."

Agent Fullerton, of Minnesota, has been interviewed on this subject by a journal of his city, and has the following to say:

"I see no reason why we can't agree on a uniform season for the shooting of all classes of game. The chickens mature in North Dakota about the same time they do in Illinois, in the average year, whatever people may say to the contrary. What will apply to the one State will to the other. Our season here in Minnesota is Sept. 1. In order to reach an agreement it may be necessary for us to concede two weeks, although to my mind Sept. 1 is early enough to shoot chickens anywhere in the territory covered by the interested States. A closed season at occasional intervals is a great aid to the increase of game, and I hope we can come to some arrangement that will include this feature. They have it now in some States, and it is said to work very successfully.

"In the matter of a license law, I think something ought to be done to equalize conditions. Wisconsin and some other States now charge a license fee on foreign hunters, and the revenue from this source is considerable. We follow the free-trade policy in this State. Certainly something should be done to even up matters between the States in this respect. Then I approve of a small gun license, say 50 or 75 cents. This will enable the fish and game authorities to keep a register of all hunters, and aid greatly in the suppression of illegal shooting."

I believe the gun license idea is apt to receive prominence, and undue prominence, at this convention. With all respect to those who believe in it—and it does have certain specious advantages as a theory—I must believe that such a measure is something which could never be put upon or kept upon the statute books of any Western State. The farmers would go into riot first, and no one can prophesy what the revulsion would be against such game laws as we have. If we are to try for uniformity, let it not be with anything so radical and dangerous as this gun tax notion.

Michigan, by its representatives, Warden Osborne and F. Chamberlain, will propose the following platform, good in some points and bad in others:

"A uniform law prohibiting shipping game outside the State in which it is shot; also a law making it a misdemeanor to ship any game or fish unless tagged as such, the tag to contain also the shipper's name and address, the penalty to be visited on both the shipper and the railroad receiving the shipment; a uniform law allowing the wardens of the States to seize game coming into their State from another in the name of that State; the prohibiting of spring shooting of all classes of game; a uniform open season for game of all kinds, and with a closed season every five or six years; a uniform license fee of \$25 operative upon all hunters going from one State to another, with a small gun license in each State."

On one great point the Michigan delegation is solid:

"If we can agree upon a matter of prohibiting the shipping of game, the battle for the preservation of game in Michigan is as good as won. That is the most important action that could be taken. Take away the incentive to shoot from the professional hunter, both Indian and white man, the game problem is solved. When the professional hunter's occupation is gone the game will take care of itself."

Close of the Selling Season.

To-day, Feb. 5, is the last day of grace for the game dealers to get under cover with such game as they had on hand before Feb. 1. Warden Loveday has been out almost day and night since Feb. 1, watching for shipments of a late and illegal nature. He seized seven barrels of illegal game in the possession of the Chicago, Burlington & Quincy Railroad, billed for shipment to a New York house, and caught here in Chicago en route. The case was brought not against the consignor, but against the carrier, and the case was decided against the railroad, the latter losing the game and being assessed for costs in the action. There is likely to be quite a grist of cases yet this month.

Several decisive cases were tried in central Illinois this past week, and I must again offer Warden Loveday the congratulations of very many sportsmen for his brilliant season's work. At Mt. Vernon the prominent citizen, Joseph D. Norris, of Waltonville, earlier arrested, was on Jan. 28 convicted of illegal shipping of quail, and fined \$400. Mr. Norris made a big front, but was landed. He has been postmaster of Waltonville and also justice of the peace. We have thus had one sheriff, one deputy game warden and two justices of the peace convicted this season in Illinois for breaking the game laws. It has been a campaign of education.

W. A. Griffith, of Rose Hill, and J. C. Raef, of the same county, were arrested for shipping quail, and fined \$107 each. E. Lord, of Willow Hill, was fined \$29.25. J. T. Nex, at Marion, Ill., was on Jan. 31 fined \$50 for shipping quail.

Freak Legislation.

Encouraged by their success in knocking out the rabbit law, the farmers of Ohio have come forward with some twenty new measures tinkering with the game laws. Of all these the champion specimen of freak legislation is the bill introduced by Mr. Bell, of Madison county. This is a sure enough farmers' quail law, and if it is passed it will make the farmer king and the man with a gun his humble and cringing slave. The press dispatches describe it as follows:

"Its title is as unique as its provisions, for it is headed: 'A bill to protect the rights of the farmers and the game and the birds of the State from the gunners and gun club exterminators of the game and birds.' According to its provisions, owners of land are given property rights in all birds, game, fish and game animals upon their land, and each hunter is required to secure the permis-

sion of the farmer upon whose land he hunts in order to proceed with the chase. The hunter is further required to inform the farmer who grants him permission to proceed with the chase what birds, fish or animals he intends to capture or kill, and as an evidence of good faith he must return after the hunt and exhibit to the farmer the result of his sport. The penalty for infraction of the provisions is, as stated above, the forfeiture of gun or rod to the farmer. If the bill passes, every farmer's house will not only be his castle, but his own court as well."

Wouldn't Mr. Bell's nerve freeze you?

North Dakota and Non-Residents.

Last September Mr. E. C. Cook, of E. C. Cook & Bros., this city, one of the oldest of our old-time sportsmen, went out to Dawson, N. D., on a duck shooting trip. A prairie fire broke out near where they were shooting, and although they turned in and did all they could to check the fire, a farmer some distance beyond them and at one side suffered loss of property by its means. The Chicago men were twice tried, or different members of the party were tried under different charges, before two different judges, one of whom was Judge Gokey. Both judges dismissed the cases, taking them from the jury with the remark that no evidence was shown connecting the defendants in any way with the fires. (Mr. Cook personally assures me that he and his party were innocent and ignorant of the cause of the fire, which broke out half a mile distant from them.) Not satisfied with this, certain disgruntled parties took up the matter in the Circuit Court, getting service on the Chicago men before they left. Mr. Cook tells me this week that a judgment amounting in all to over \$1,000 has been rendered against himself and party, and that they have already spent over \$600 in defending the case. He was just back from a trip to Steele, N. D., the county seat where the case was tried, and he laughingly assured me that he didn't know where all this was going to end, but he thought it was pretty rough.

The Dawson Times, a local paper, led the fight on Justice Gokey and the Chicago men above mentioned. Hundreds and perhaps thousands of dollars have been spent annually by sportsmen in the little town of Dawson. There is no just computation possible of the damage this town does itself by such inhospitable, high-handed and sour-spirited an injustice to non-residents as that above recounted.

The Winter and the Game.

The season of 1897 was one unusually good for game, especially quail, partridges and other small game. In Indiana, Illinois and Michigan the shooting was exceptionally good. Until the past two weeks our winter here in Indiana was very mild, and it was fair to suppose that the game would winter well. The heavy storms of last week and this week have changed this situation very materially. Upper Indiana, I can personally say, is largely sealed up with ice and crusted snow, in all a foot or two deep, so that the quail must suffer. From Michigan Mr. W. B. Mereshon writes me the following discouraging news:

"We are having more snow during the last two weeks than I have seen any winter for eight or ten years, and I am afraid it means death to the quail. While there has been no crust yet, the snow is very deep, and it has drifted badly. Too bad, isn't it?"

"I have a letter this morning from A. B. Paine, a farmer, in the direction where we were hunting last fall, which reads as follows:

"Do you know that mink are killing all the quail in this part of the world this winter? On this place three flocks have been wiped out. My attention was called to the mink by trouble in my hen-house. I was told by trappers when I described the hole in the neck of the dead fowl that it was the work of mink, and I was very skeptical until I killed one and put a stop to the trouble for a little time. Since that it is no rare thing to find mink tracks leading into a thicket, and a bunch of quail feathers tells the story. Mink skins sell for cash. Can you not start a good man up our way with his traps, and do himself, farmers and hunters a good turn?"

Mr. Ruthven Deane, of this city, writes me that on Jan. 20 fourteen mallards were seen at English Lake, on the Kankakee River, Ind., and three of them were killed. He adds:

"There were also seen at same time a few buffle-heads (butter-balls). Last Sunday, Jan. 30, Lake Michigan was covered with ducks off the Lake Shore drive, on the north side, probably scaups. I presume the recent blizzards and icy winds have turned them a little further south. A good many geese were seen last Saturday, Jan. 29, flying over Washington Park, Chicago."

At Maksawba Club, on the Kankakee River, Feb. 2, we heard that a good-sized flock of mallards had been wintering on the river, and had been seen within the week.

Beware the Camera.

It is a human weakness to be photographed in connection with a string of fish or bunch of birds. On Aug. 2, last summer, it is alleged, G. A. Dubois, of Neenah, Wis., went hunting in Price county, and killed some illegal ducks. He went to Park Falls and had himself and the ducks photographed. It chanced that Gustav Frellson, of Green Bay, and Dr. F. W. Stewart, of Wauwatosa, had been out fishing, came along about that time and also stood in the photograph. Now comes Deputy Warden Frank Bissinger, of Green Bay, secures a copy of the photograph and arrests the whole outfit for shooting ducks out of season, as see the testimony of the camera. This sort of Dog Tray guilt is enough to teach sportsmen to beware the camera and its possibilities.

Minor.

My old friend Billy Griggs, the king of the market hunters, did not go to Galveston to shoot canvasback this winter. He is engaged in fishing for the market at Greenville, Miss.

Mr. Hunt, of Burlington, Ia., has introduced a bill in the Legislature making doves a game bird, with an open season from July 15 to Sept. 1. A similar movement is probable at the next Illinois Legislature.

The Peace River buffalo herd again crops up in a vague newspaper paragraph quoting "a Canadian trav-

eler" to the effect that in the Peace River country there are at least four herds of buffalo, not less than 2,000 head in all.

The old principle of the common law, that ignorance of the law is no defense, was brought out twice this week in instances of violation of the game laws. A farmer in Iowa killed a prairie chicken, believing he had a right to do so on his own land. He was fined \$25. At Pomeroy, O., William Bickner, a farmer, shot a strange bird which he saw sitting on a tree, and which he thought was a hawk. He took the bird to the game warden, who told him it was a mongolian pheasant, and worth, under the circumstances, \$25.

Sportsmen of Joliet, Ill., are organizing a duck shooting club, with grounds on Goose Lake, one of the famous wildfowl grounds of the Illinois river bottoms. The club will number 25 members and will control 650 acres of property. Henry Young is one of the promoters.

A dozen foxhounds, imported from England, are in Chicago this week, on their way to Sioux City, Ia., where they will be used by the Woodbury County Hunt Club in hunting coyotes.

E. HOUGH,

1206 BOYCE BUILDING, Chicago.

Elk in Jackson's Hole.

JACKSON, Wyo., Jan. 12.—*Editor Forest and Stream:* I am glad you take the stand you do in regard to the catching and shipping of elk in Jackson's Hole. We are decidedly against the practice and wish to see it stopped, and you can do us a great deal of good by helping to stop it. Inclosed find photos of elk taken by me this winter, showing the elk on their winter range. Imagine the harm that could be done by chasing such bunches of elk in the snow. Elk are very easily heated up. On a cold day to run a bunch a quarter mile makes the steam rise over them as if they were on fire. It is not only what are caught, but the damage done to those that are left, that should forbid the chasing. At present we have about 6in. of snow in the valley, and the elk are wintering well. As I write these lines I can see them in nearly every direction from the ranch quietly feeding on the hillsides, with nothing to alarm them. It does a person good to look at them.

The people of Jackson's Hole are in favor of the protection of the elk, but we get the blame for the deeds of tourists and non-residents, and are woefully misrepresented.

S. N. LEEK.

Another correspondent writes: "The people of this valley are as a rule anxious and willing to protect the game, and we have always done so, and there is more game here now than four years ago and prior to the Indian troubles of 1895. There are 300 head within two miles of my ranch at this writing, and the game is not affrighted at travel or our passing near the bunches. Last evening I passed through a large band of elk and they seemed to pay no attention to me. Whether the present timber reserve lines will do any good to protect the game or not I cannot say, but I don't think so. The game winters much south of the Cleveland or Teton timber reserve lines and among the settlements.

As long as our people can have fair dealing from the press we will use all necessary force to keep intact the largest band of elk now existing on the American continent, and it is my opinion that this band of elk will always under existing conditions continue to increase some in numbers, unless it be the male animals which are ruthlessly hunted during the fall months and the open season. It is true that without hay once in four years the calves will most all die. If the Government would take this game into its keeping, and buy about \$5,000 worth of hay per year and feed these elk, these mountains would keep them for a thousand years. Some one interested in the game should come here and investigate its condition.

Camp-Fire Flickerings.

"That reminds me."

The Rattlers of Gran Coulee.

IN those days deer were in the woods three miles or so from Monroe, not far from the head of Lake Erie. A big whitewood shaded a pool in the ditch that drained Gran Coulee. Hundreds of footprints proved that coons and turkeys and deer knew that pool.

I stopped beneath the branches of that tree to cool off, after a hunt for squirrels one afternoon. I looked idly at those tracks, and thought: "How great a thing it would be to come here some bright night, climb into this tree, kill a fat duck, and stop their laughing about boys who go out to hunt squirrels and come home to hunt grub—without the squirrels."

A buck jumped the dooryard fence one evening soon afterward, to drink from the spring that bubbled in the middle of the lawn. He took his drink quietly. I don't know whether he had been told that no dog nor gun would be allowed to molest deer or bird or other wild thing within that fence; but he was certainly unfrightened. I looked at him, and suddenly felt that the hour had surely come for slaying a buck at that pool under the whitewood tree.

The moon beamed brightly on the yellow stubble of the coulee, and the snow-white sand that lay in a ridge beside the ditch was a clear road for me. I was soon seated on a big limb not more than 7 or 8ft. from the sand. Within half a minute a mosquito came to see who had come. Others of her kin quickly followed—or had they come with her? Other hundreds were there almost as soon as the first.

I waved my handkerchief about my face gently. I suddenly brushed that part of my jeans trousers which was drawn tightest as I sat on that branch. I was gentle with them, very gentle, for the slightest sound—well, you know how it was.

Blessed saints! how fast those mosquitoes came! How promptly they sank their shafts! How promptly they sent in their bills! They were more prying than a smart

lawyer at a cross-examination of a shifty witness. They bored me even worse than this yarn is boring the reader.

And I dared not slap them, even though I might kill thousands. I hardly dared hint, with softly moving hand, that their attentions were too pointed. One slap, and all the bites already endured would have been suffered in vain. No deer within half a mile would have come to that field within another hour, and an hour of that—not for all the deer that ever trod those woods.

I began thinking that it might be better to wait until another day to kill my deer; the deer were evidently willing to wait. They would be fatter when the buckwheat would be harvested, and they would hop over the fence to feast on the three-cornered grain.

Five minutes—or was it perhaps twenty seconds—convinced me that it was a closed season for deer, anyway, and that it would be vastly unkind to kill a deer that night, and so prevent his fattening for some man's Thanksgiving dinner or some other man's Christmas supper. At any rate, it was time to stop those mosquitoes fattening on me.

I tied a corner of my handkerchief to my belt and that to my rifle. Then I peered intently at every bit of shadow fringing that field, to see whether there might be some visible reason for changing my opinion about leaving the deer to eat up the buckwheat of hardworking farmers. But the coast was clear, abominably clear; so I lowered the gun and swung it to one side, that it might be out of the way when I should drop to the ground.

That gun was jerked up again as if it had been my hand. What the dickens was that! What made that rattling down there?

I remembered, suddenly and vividly, that thick rattle-snake which had crawled lazily out from a sheaf of wheat when Duluy had dropped it after binding. That snake was as thick as my arm. Why, it was not 30yds. from this very tree that we killed the thing!

How hot the night was! Sweat ran down my back and into my staring eyes. The mosquitoes troubled me no more.

I cautiously moved around to another limb, and again I lowered the gun. I swung it again, widely, too, but with another purpose this time. And as sure as I live, I stirred up another rattler. But that time I didn't jerk the rifle away. I had reflected that even the biggest fangs or the most venomous snake could hardly hurt the iron. I waited. I suppose I thought. I know I sweat awhile. And the mosquitoes made themselves felt once—no, dozens of times more. At last the moonlight fell on the white sand beneath the branch on which I sat.

"I'll risk it! I can drop in the middle of that white path, and skin out before a rattler can strike. Let me get out of this shade once, and I can see snakes, if there are any, quick enough to dodge 'em."

I did it. I trod most cautiously along that snowy path until I reached the road; and not a rattler struck at me. But I did jump half a rod or so at the sound of a rattle when my gunstock touched a little bush as I passed.

I had snakes in my dreams that night, and I was an old man when they roused me out for breakfast next morning. A cup of coffee put new courage into me. It was time, for the old stock had run out the night before. By the time my stomach was full of breakfast my soul was full of resolve to go to that field and annihilate those rattlers. I found them; plenty of them, too. Some were close beside the path along which I had legged it in the night. Others I found under the very limb on which I had perched. I didn't exterminate them. There were too many. It would have been too much work—too much like everyday, hard farm work.

They were wild peas, ripe in their pods.

E. L. PERITARA.

Sea and River Fishing.

On Bistineau Lake.

THERE was good fishing, and a variety of it, in north-west Louisiana some twenty years ago, and no doubt there are plenty of fish left; but I only made one trip down through that country and Arkansas, and it was a trip so full of incident that I could fill a volume with it, if I could get any one to read it. Fishing, shooting, gander-pulls and shooting matches, interspersed with dances where conventionality did not bar out fun, kept me busy studying mankind as well as fishes.

Bistineau Lake lies between Bienville and Bosier counties, is over twenty miles long by some two or three wide, and empties into the Red River. At Buckhorn I found a ducky who had a team and wagon, and also a boat upon the lake, and I subsidized him to take me and a 5gal. alcohol tank over the lake, some few miles off. He said that his name was Augustus Cæsar Trulo, and I never forgot it. A man told me afterward that his late master's name was Truxillo, and the corruption from the Spanish was evident.

Rod case, creel, luncheon and all necessary impedimenta had been loaded, and we were driving through the heavy timber, over a rough road, in a lumber wagon whose jolts forbade prolonged conversation; but as we came to a comparatively smooth place where one could speak without danger of biting his tongue, I asked: "What did you say your name was?"—not that I had forgotten, but to get down to a basis where I might get a name that could be handled without having to run over the list of Roman and possibly of Spanish heroes.

"Augustus Cæsar Trulo is my name, sah."

"Yes, I remember; but on a fishing trip that is more name than I can sling out when I'm reeling in a fish and want you to hand me the landing net. What do your friends call you?"

"De people 'bout yeah, dey mos'ly calls me Gus, sah; but w'en I lived with ole Mass' Trulo, befo' de wa', he call me Cæsar, sah; but he done got killed up 'bout Georgia, an' he had no fambly, so we boys drifted from Opelousas up dis a-way. We's a-comin to de lake at de nex' turn in de road, jes' beyond dis swamp."

"Very well, I will call you Gus."

"Yes, sah; an' w'en I wants to speak to you, w'at shall I say?"

"My full name is Aristophanes Demosthenes Socrates Kego-e-Kay, but my friends shorten it into Smith, and you may call me so." And right there Gus and I got right down to plain, practical business principles and dropped all nonsense.

Gus had his own tackle and baits, for methods of fishing by the natives were a thing I wanted to study. He had a native cane, and it had been well selected for taper and for even distribution of strain; it was as good a specimen of that very good crude fishing rod as you will find in a thousand. He had no reel, but he had tied small brass rings at intervals, and one on the tip, and evidently depended on his left hand to haul in or pay out from a coil in the bottom of the boat. When his tackle was inspected it was plain that its owner was an angler, and I had fortunately blundered on the right man to take me to such parts of the lake where the fishing might be good. He had a can for live bait and a mosquito-net seine to catch them. Great was his surprise when I picked out a lot of his bait-fish and plumped them into the alcohol. The larger fish of this region were well known, and the only hope of finding any new species lay among such as never grew beyond 4in. in length. To explain the value of these to Gus would be a waste of time, but he was always curious about them.

"Dis weed-bed dat we's comin' to is a great place fo' trout, an' I'll drop de ancho' at dis end, an' move up an' aroun' it w'en yo' say so. I dun cotch some big trout yere in de las' May, an' dey's plenty lef'."

Knowing that all through the Southwest the black bass is called "trout," and that the natives do not differentiate the two species, and also that it would be useless to try to correct the nomenclature, I "drank the wine of the country" and spoke of the two species of black bass as "trout." Men have been burned at the stake for their opinions, but not in modern days. Just as I gave in to Gus in order to avoid useless argument, just so I would yield to avoid torture; but my opinion, like that of Galileo on the rotation of the earth, would not and could not be changed. I admire the courage of the martyrs, but not their diplomacy.

Gus watched the putting together of a split-bamboo rod and the attachment of the reel in silence; but when the gut leader was brought from its damp box and the fly-hook opened his curiosity was aroused. "What yo' gwine do wid de feeders on de hooks? Is dem de kin' o' bait yo' use?" And he looked incredulous, but said no more.

"Yes, the feathers on the hooks are bait of one kind; they look like insects to the trout, and we call them flies. If the fish here refuse them, I'll try your minnows."

"Dey looks like dry fodder fo' a fish, 'deed dey do fo' a fac', an' dey doan' look like de flies we has in dis parish. Is de flies in de Nawth all bright, speckled an' hairy like dem?"

"Oh, yes." It was easier to say this than to go into an entomological lecture on a subject that I did not fully understand, and Gus was so intent on my curious rig that I was ready and made several casts before he attempted to rig up. Then came a rise and a strike, and the reel sang. The play of the rod and the alternate giving of line and reeling in kept my colored friend dumb with excitement until the fish leaped from the water some 30yds. away, when he yelled: "Hang on to him, Mr. Smith; doan' let him break yo' pole; he's de bigges' trout in dis lake; he break yo' pole, shuah!"

"No, he can't break it, not if he was ten times as big. You get that landing net ready to slip under him when I get him near the boat; slip it in the water alongside the boat, and don't frighten him by a sight of it."

"Yassah, but dat leetle pole mighty apt to break fo' yo' get dat fish to de boat; it's dun mos' bent double now."

"Never mind that! Get the net in the water, and don't make a splash. He's tired, and is resting as he comes in, but will make a rush for the weeds or under the boat if you scare him."

The fish had rolled up on its side, nearly exhausted, and was led near the net. Victory was at hand, but it was victory for the fish, for instead of using the net Gus gave a whoop as he grabbed the leader and tried to lift the fish into the boat. I had a glimpse of a big-mouthed black bass which might have weighed 8lbs. going off with my fly and some 2ft. of leader, and my remarks, after several expurgations and condensations, might be translated like this: "Mr. Augustus Cæsar Trulo, I much regret that you did not obey my orders and use the landing net. The great warriors after whom you were named would have made an example of you for so serious a breach of discipline. Your orders were explicit to use the net, and bless you! you poor, blessed, doubly blessed man and brother—" (here my notes are blurred; the wires of memory's phonograph buzzed, but not distinctly).

Gus had dropped into that sensible state which follows a moment of excitement, and said, apologetically: "'Deed, Mr. Smith, I see dat ah trout a-gwine undah de boat, an' I try to bring him in. Dat ah net I fo'get 'bout, 'cause I nebber use one. I'se sorry you lose dat big fish, but dah's biggah ones in dis yer lake, an' afo' yo' go dah'll be some cotched. I'se sorry dat yo' use such pow'ful strong language w'en a fish dun got away, 'cause dey's mo' fish to come, an' I'se been tol' dat yo' mussen' swear if yo' want to ketch fish."

By this time the leader was repaired, and a large brown hackle had replaced the last red ibis, and I merely said: "If another fish is hooked, don't you touch my line. I'll keep this oar here, and I'll knock you overboard if you do. Get that fact fixed in your mind, and use the net as I have told you. This rod is not made to lift a fish out of the water, but it can tire out a fish that would snap your cane pole. That fine silkworm gut is only fit for such work as the rod can do, and when I bring a fish to the side of the boat I want you to do just as I say; lift him in the landing net if you can, but don't scare him so that he will make a rush under the boat or into the weeds. Have you got that through your wool?"

"Well, sah, Mr. Smith, I mus' ask yo' to 'scuse me; I nevah dun fish dis way befo'; de trout seem like he

gwine away, an' w'en he so close by, seems like I mus' pull him in. Nex' time I try yo' way an' put de net undah him; but I used to pull him in awn de line."

"Why don't you bait your hook and take a fish? I want to see you handle one."

"Golly, Mr. Smith, I'se waitin' to see yo' cotch one on de little pole an' de fiddle string. It 'peared like he was goin' to break away fum de line an' break yo' pole, an' I got so 'cited I dun hole my breff, I did, fo' a fac'. Dat ah was a big trout to pull in awn a fiddle string, an' I'se jes' a honin' fo' to see yo' cotch one. Yo' dun cotch dat ah one on'y fo' my foolishness, but I promise not to touch de line ag'in."

A few casts of the brown hackle brought a rise and a strike. There was quite a little fight, and as the fish was brought in Gus netted it in good shape. It was a big-mouth that would weigh about 1/2 lb. Gus took a number with minnows, some large ones, but he became excited when I hooked another big one, and he came near repeating his former mistake, but refrained from grasping the line when he heard what I said. There was no time to argue the case, and my remarks were vigorous and to the point. They arrested the outstretched hand at once, and the landing net was substituted in good shape. That fish weighed nearly glbs. on the grocer's scales. We took twenty black bass at that spot, and two of them were small-mouths of small size. They jumped out of the water, and so did many of the big-mouths, and that excited Gus every time. He used strong tackle and whacked a fish in the boat by main strength, if the hook did not tear out, and there was but little fight. He saw a new mode of fishing which afforded more sport than his own, and when I said: "Gus, I've got trout enough and had fun enough with them; let's go to some other place and catch different fish," he asked to be allowed to take a "trout" with my tackle.

"No, Gus, you'll break rod, reel and line, and you can't cast a fly as I do. If a fish rose at the fly and you hooked it, you would try to lift it on the rod, and then the 'fiddle string' would break if the fish kicked." And so we went from the margin of the weeds to the deeper waters.

"What fish do you get out here?"

"Well, sah, we gits cattie, pike, crappies, perch an' a lot o' kinds; I doan' know de names ob all ob 'em; some dey calls 'em 'red-eye' an' some dey calls 'em 'waw-mouth' an' sun perch an' raccoon perch, an' a lot o' names, but dey's all good w'en dey's fried, 'cept de gars, an' dey's pizon."

A light wind took us up the lake, and I got out a trolling rod and spoon. Gus had seen the latter, and called it a "bob." He put on a sinker and minnow bait, and I trolled the spoon. A heavy strike brought in a long-snouted 4ft. gar, and Gus put his pocket-knife in his jaws while I cut the spoon out of its throat. If this ganoid had perished when most of its kin were made into fossils, the fish world would be richer to-day; it is very destructive and is not fit to eat. I asked Gus if he had ever eaten this gar-pike, which, by the way, should not be confounded with the silver gar of salt waters, which often run up rivers. The latter is edible, and I have seen schools of small ones as far up the Hudson as Albany, where we boys called them "swordfish."

"No," he replied, "I doan' eat no ole gah, but I tas'e him once, an' he got sof' meat, but hees bone and hees skin is hard 'nuff. Some poor colored people eat um, but I can get bettah fish; trout an' pike an' crappie, dey's good 'nuff fo' me. But dis yah gah is de long-snout kine, an' doan' grow much longer 'an dis yah one; but down 'bout Opelousas I cotch de big kine we calls alligatah gah, 'cause he got flat jaw like de gatah, an' I dun cotch one long as dis boat, me and two oddah boys, an' we broke bofe oars a clubbin' him awn de head befo' he keep still an' we paddle to de sho'. Oh, I tell yo', he take a man's han' off, an' knock him down wid hees tail."

The boat was 10 or 12ft. long, and the size of the fish was guessed at and may have been exaggerated, yet Jordan, "Manual of the Vertebrates," says that the alligator gar, or manjuari, grows to a length of 10ft. I had seen one of nearly 8ft. hauled in a seine down near Baton Rouge, but to tell of this would prove that I knew the fish and would cut off further information; so I said: "That was a big gar. Are you sure it was as long as this boat?"

"Yes, sah, 'deed it was, an' longah, 'bout 6ft. longah, an' his ole snout was broad as that (about 18in.), an' some wite men dey cotch one down on Catahoula Lake mo' 'an 50ft. long."

"What was 50ft. long, the fish or the lake?"

"De fish, sah. But I didn't see dat one, on'y hear de boys talk 'bout it, and dey took a boat an' a piece ob a man's leg out o' dat ah fish, an' dey foun' his haid an' some more o' de man in de net where de fish he chuck it."

"Was the man dead?"

"Daid! Yes, sah, he was daid fo' a fac', an' all cut up. He was sho' 'nuff daid."

"What was his name?"

"I dunno, sah, he fo'got to tell what his name was. I 'spects yo' is habin' fun wid me an' dat fish, but it was befo' my time, an' I tole yo' de story as de ole men tole it w'en I was a little boy. Dey is some o' dem gatah gahs in dis yeah lake, but I doan' see none much longah dan dis yeah snout, an' dey chews up mo' fish dan de pike, an' de pike's good to eat. Now when de pike take hold a fish he take him end on, and ef he get him crossways he turn him to get him in end, but dese debbils takes 'em crossways and chaws on 'em an' mos' times cuts 'em in two an' was'es half de fish befo' he gits him turned; den he got to git annuder to fill him up."

I appreciated my luck in falling into the hands of such an observing man, and when we unloaded at the house where I was stopping I took what bass, pike and crappie would make a dinner for the rather large family and gave the rest to Gus; and as I paid him we arranged to fish again two days later, and in the meantime I would fish the streams with line and minnow net for small fishes, mollusks and crustaceans for the alcohol tanks. It is an old saying that a Yankee is inquisitive, and in the South at that time the Ohio Buckeye, the Indiana Hoosier, the Wisconsin Wolverine, as well as the Californian and the New Yorker, were Yankees as

well as the citizens of the New England States. But I was put through a nightly catechism, beginning with: "What did you get to-day?" "What are you going to do with them?" and "What are they good for?" The first two questions were easily answered, but the third was a poser. To explain the relation of "little water-bugs" to other forms of life, and to man, was up-hill work to a fellow who was aware that he was looked upon as a harmless sort of lunatic who spent his time in gathering a lot of useless things, but who paid his bills and was thereby entitled to spend his time as foolishly as he pleased. It was not so much the questions as the consciousness that my mission was not understood, and that I could not make it understood by the men and half-grown boys from whom there was no escape in the evening. To be looked upon as a curiosity is embarrassing, unless you are a fat woman, living skeleton or "beautiful Circassian girl," and make a profession of it.

A stroll along the shores of the lake with a light double gun was taken alone, in order to pick up any object of interest without having to give a lecture upon it; and it is well to be alone sometimes. The day was overcast and foggy, an ideal day for ducks, but I was not expecting anything in this line, merely thinking to pick up a few shore birds, or "bay birds," as we call them in the Great South and Barnegat bays of Long Island and New Jersey. A walk of half a mile brought a couple of ducks in sight, and as their eyes were better than mine, it seemed strange that they did not move. A few steps, and more ducks came out of the mist, all ignoring my presence. Both hammers were let down, and as I made an excursion to the left to get behind the blind of the men who had the decoys out, the men fired six barrels, but I was too far to see the effect. On reaching the blind there was a pile of ducks, about fifty, they thought, and they were shooting for the New Orleans market. There were many species. I only remember that they said that the mallards had not got down from the North yet, as the weather had not been cold enough.

At noon I sat down to eat my cold roast chicken, ham sandwiches and boiled eggs, which the good housewife had put up for me in profusion, and then sat still, thinking of nothing, enjoying a mere animal existence. My seat was a low log, near a spring, and perhaps 50ft. from a little stream which was on its way to the lake. It was a Rip Van Winkle spot that seemed to have hypnotic powers, and I was suddenly awakened, not by sound, for the leaves were too damp to rustle, but by a moving object. Gradually it assumed the familiar form of a raccoon, and my fingers clutched the gun. Then came the thought: "Why should I kill or wound this animal, which has as much right to walk this earth as I have? I do not need its meat nor its skin, and it does me no harm." The coon passed on, turning stones for crayfish or other things, with perhaps an eye out for a frog. In writing of this a story of two men "frae the land o' cakes," who had been imbibing not wisely, but too well, comes to mind. One said: "Donald, let's hae anither drink."

"Nae, Jamie; I hae enough."

With a look of contempt Jamie said: "Hoot! mon, you're lettin' your judgment get the better o' ye." And so on this occasion I sacrificed inclination to "judgment."

The walking along the shore was difficult; there were marshy places and fallen trees to go around, and none of that hard beach which affords the salt-water gunner good footing. I had quite a load of mussels, *Unios*, some sandpipers, plovers and other birds, as well as a few squirrels and a pintail duck which had recklessly crossed a point within range of my light gun, and while thinking of tramping back up the lake there was a sound of footsteps and my ears moved forward to assist in determining who might be coming. When one is alone there is always an intense interest in any one who approaches, even if he knows the country is at peace and there is nothing to fear. I never have this feeling when passing "The Man in the Clock Tower" on Broadway, because man is so frequent there; but down on a lone Louisiana lake the passing of a mud turtle or the jumping of a frog has interest. Therefore I listened to see who was coming.

There was a period of silence, as if the intruder had decided not to go up this little stream, and then the tramp on the damp leaves was resumed. I had enough ham, bread and chicken to entertain any fellow-sportsman, if he were hungry and would only show up.

On the further side of the little creek a form loomed up out of the fog. It looked as big as a country school-house, but when it came clearly within range it proved to be a good-sized bear, slowly going up stream after such small game as its cousin, the raccoon, was looking for. Here again I let my "judgment get the better o' me." I did not anger that bear with a charge of bird shot; and in fact there was no room for several hundred pounds of bear meat in my haversack.

The big sickle-billed curlew which I picked up on the homestretch was turned over to the good woman of the house, with the duck, which she stuffed and baked, but I reserved the yellow-legs to be split, broiled and served "hot and rare" for myself. To those good people this seemed as barbarous as the stuffing of a wild duck with sage and onions did to me. Miss Melinda said: "That bird isn't half done; I don't see how you can eat it." And I merely replied: "If it was cooked more it would be spoiled."

Taste is largely a thing of education and familiarity. A bottle of olives had been sampled by this worthy family and rejected. Melinda put up my daily lunches, which always included some olives, but when I came back a month later she had cleaned up the half dozen bottles left in my reserves and was ready for more. Jim, a young brother, said: "I like them yellow-legs and sho' birds half cooked, jus' as yo' had 'em, but mam says they're no good; an' I'm glad yo' come back. Say, how long yo' gwine to stay?" FRED MATHER.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as p. actible.

The Early Days of Fishculture.

BY LIVINGSTON STONE.

[Read before the American Fisheries Congress.]

ABOUT a third of a century ago a strange story began to be spread abroad in this country, that a man in western New York was hatching trout eggs—thousands upon thousands—and that he was rearing the fish and feeding them in ponds, and there was literally no end to the number of fish that he could hatch.

The story naturally made a decided sensation throughout the country; but of all the people that heard it very few at first believed it. The present age of almost daily recurring marvels had hardly begun then, and people were more incredulous and slower to accept apparent miracles than they are now. And then, again, the country being in the throes of a civil war at the time, it followed that discoveries in the peaceful arts did not attract the attention they would have done in quieter times. But the story about the man who was hatching out thousands of thousands of trout steadily gained ground. Presently the great New York dailies took it up, and soon after it came to be an accepted fact that something wonderful was being done by this New York trout hatcher.

In the meantime the man himself, quietly working away in Caledonia, had succeeded in actually proving beyond a doubt that the hatching of trout on an immense scale—not as an experiment, but as a practical industry—was a practical thing, within the easy reach of human skill.

It was the first time that this had been accomplished. Amateur and scientific experiments on a small scale had been made by various persons at various times, and the method of hatching fish artificially had been known for a century, but it remained for Seth Green to introduce into America the hatching of fish as a practical and valuable industry, and to him belongs the credit and the honor of opening the way to the vast practical work that has since been accomplished in this country in hatching and rearing fish, and to him eminently belongs the title, justly earned, of the Father of American Fishculture.

A year or two after Seth Green had inaugurated American fishculture at Caledonia the writer established the Cold Spring Trout Ponds at Charlestown, N. H., but, strange to say, up to this time, although Seth Green's operations in New York had been so fascinating and so promising, no one in this country had taken up the breeding of trout, that he had been so successful at.

The time, however, was now ripe for the spread of trout culture, and very soon after the establishment of the Cold Spring Trout Ponds trout breeding places sprang up in all directions. Raising trout suddenly became fashionable and popular. During the first two years of his trout breeding experience the writer received letters from almost every State in the Union, written by persons actually engaged in, or more or less interested in, trout culture. The interest in trout breeding became universal, and everything written about it was eagerly read by all who were interested in fish at all.

These were in the palmy days of trout breeding in this country. Prices were high—trout eggs brought \$10 a thousand, and young trout fry \$40 a thousand. Trout large enough for the table brought \$1 a pound at the ponds, and the city hotels paid 75 cents a pound for regular weekly consignments. There was a large demand for trout eggs and a fair demand for young fry and for trout for the table.

Trout breeding prospered, and with it all there was a novelty about the work which then had not time to wear off, and the business of the trout breeder—for it had now become a legitimate business—came to be a pleasant, prosperous and profitable occupation. It would be interesting to describe more minutely the rise and decline of private trout culture in the United States—for, alas! the decline came only too soon—but that would not come within the scope of this paper. Suffice it to say that the competition soon brought prices of eggs and fry down too low to make the business profitable generally, and the market price for table trout falling at the same time, many who engaged in the business fell out for want of pecuniary encouragement, while others who raised trout for the enjoyment of it gave it up because of the many risks and difficulties which stood in the way of success.

It is a fact worth recording—and one that seems very curious in the light of present events—that while so many at first went to raising trout, no one seemed to think that it was worth while to hatch any other kind of fish, and it is also a fact worth noticing that if artificial fishculture had been confined to the raising of trout, as it was in the first three years of its career in this country, the vast and beneficent work that is being done at the present time would have been unknown.

If again remained for the bold and adventurous spirit of Seth Green, with his far-reaching vision, to enter the larger and more important field of hatching fish that had a standard commercial value. Every one knows of his attempts, his failures and his final success in hatching shad. These efforts of Green in demonstrating that other and more valuable fish could be hatched as easily as trout did indeed open up a field for fishculture, so vast and beneficent to mankind that the previous trout culture work shrank into insignificance beside it. Thus it was that Seth Green earned a second time his claim to the title of Father of American Fishculture.

All the present magnificent work of our State Fish Commission and the United States Fish Commission owes its origin to Seth Green's shad hatchery on the Connecticut in 1867.

In 1868 the writer, in connection with Mr. Joseph Goodfellow, erected a salmon breeding station on the Miramichi, in New Brunswick. This was on a large scale, and was the first effort at systematic, practical salmon breeding in America.

As illustrating the high prices for fish eggs that prevailed then, I may mention that I received over \$1,000 for a good-sized water pail of salmon eggs from the Miramichi in 1869.

The Miramichi salmon breeding station would have been a valuable source of supply for salmon eggs, had

not the public sentiment in Canada been so strong against exporting salmon eggs to the United States. This feeling was, however, so strong that the enterprise had to be abandoned, but the Canadian Government took it up soon afterwards and sold salmon eggs to this country for the enormous price of \$45 a thousand, or \$1,000 a gallon.

I must not forget to mention, as among the most important events of the early days of fishculture in this country, that the State of New Hampshire, with singular foresight, established a fish commission in 1864, the same year that Seth Green began operations in Caledonia. New Hampshire was soon followed by Massachusetts and other States, and in 1871 the United States Commission of Fish and Fisheries, through the efforts of Prof. Spencer F. Baird, was created by Congress. The American Fishculturists' Association, now the American Fisheries Society, had been formed in 1870.

By this time there were also innumerable trout culturists in the field, and fishculture in the United States may be said to have passed the days of its infancy and to be fairly on its feet.

In looking back over those early years and contrasting them with the present, when such an immense mass of information is available, one is forcibly struck by the almost universal ignorance on the subject that prevailed at that time. This was true not only of people generally, but of well-informed men also; for even scientists who rightly deserved the name, and university graduates, and accomplished scholars who prided themselves on the variety of their knowledge, and reading men who kept up with the magazines and newspapers, could tell you nothing of this new art of fishculture.

Yet this was not so very surprising, for books had not yet been published in this country on the subject, magazine articles about it had not appeared; cyclopedias did not contain the information, or at most only the merest outlines of it, and unless one happened to come across the not easily accessible reports of specialists there was no avenue open to the public by which more than a superficial knowledge of the subject could be reached.

People generally were so utterly ignorant, indeed, of the whole subject that almost any story told about fish eggs would pass unchallenged. As an illustration of this, I heard some one tell an inquisitive but intelligent man that trout eggs were hatched by putting them under a hen in the barn, and the inquirer knew so little about it that he actually did not venture to express a doubt, for fear that he should display his ignorance. The man was not a scholar, it is true, but nevertheless some of the best informed men knew little more than he did about fishculture, for the simple reason that the knowledge was almost inaccessible to the people. How different from the present day, when the minute fish-life of the very bottom of the oceans is closely and thoroughly studied, and the fish food furnished by the microscopic life of the fresh-water lakes is measured and classified.

To go back in memory to those early days is not only to enter the enchantment that distance brings, but it is also to return to what was a real enchantment then. It seems as if we should never feel again—I know I am expressing the feeling of all the early experimenters in hatching fish—it seems that we should never feel again, and we probably never shall feel again, the thrill of excitement that tingled to our finger ends when we first saw the little black speck in the unhatched embryo which told us that our egg was alive. It was one of the dearest sights on earth to us then. And when the first little trout emerged from his shell and wriggled in the water, why were we so excited and elated? Was it because that little fish opened up to us a new world of promise and because we had a dim vision of the countless multitudes of living creatures that this little embryo was the insignificant forerunner of? I suppose it was something of the sort. And now, after those long years have passed and we coldly watch under a microscope, with a half scientific interest, the development of this little black speck named by scientists the "choroid pigment," we can hardly believe that such a commonplace, matter-of-fact affair could have stirred our feelings and our imagination as it did once, when the sight and sensation were both new, and the world of promise before us was untried and unknown.

Recalling those early years, two figures stand out in memory more prominently than all others. One is the figure of a strong-featured, broad-browed man of rugged frame and rugged countenance. He had the bearing and the look of a man who thought no struggle too severe for him, and no foe too formidable. He looks the strong man that he is. He is of the Zachary Taylor rough-and-ready type, but withal he has a hearty and genial manner, and a frank and honest nature looks out of his eyes, that show that no shallow mind lies behind them.

Every fishculturist knows whom I mean. I had previously visited Seth Green at his home in Caledonia, but it was not till I met and assisted him at Holyoke in 1867 that his strong personality impressed itself on me. He was there conducting his first experiment in hatching shad. He was entirely alone when I visited him, and his first attempts at hatching had just ended in signal failure. The peculiar character of the eggs and the peculiar treatment required for them had baffled for a time even his keen-sighted genius, and he had in despair almost decided to give it up and return home. The fishermen he had hired to help him were laughing at him for what they called his foolishness. But although alone and depressed in spirits, and with no one to offer a word of encouragement, Seth Green kept on, and with his dogged persistence and determination fought and overcame one difficulty after another, as they met him, until at last he was rewarded, as the world knows, with overwhelming success. Perhaps I may be allowed to add that a warm friendship sprang up about this time between Seth Green and myself which continued to the day of his death.

It was a pleasant thing to see the change in Green's spirit that came with his first success in hatching shad. It seemed a little thing—nothing but some little, delicate embryos appearing in the frail eggs that he was working over. Little it was, but it was the herald of illimitable possibilities which possibly the man himself did not realize. But however that may be, it restored his

spirits and made him almost instantly a changed man.

I once asked Gen. Phil Sheridan what was the most thrilling moment of his career during the War of the Rebellion. Gen. Sheridan answered, laconically: "When the tide turned at the battle of Winchester." I think that perhaps Green's feelings at Holyoke, when his first shad showed signs of life, might have been somewhat similar. He was attempting what no one else had ever thought of accomplishing, on which vast results were depending. The eyes of all the fishcultural world were on him. Thus far he had failed. He was for the time being defeated. Then the tide turned, and almost literally in a moment the whole thing was changed and he was victorious in a great battle, the far-reaching results of which will doubtless survive even the great nation that Sheridan fought for.

Green's strong traits of character were not the only thing about him that called attention to the man, for united with these were a sound judgment and many rare gifts of genius. He had the happy faculty of seeing and fixing his mind on the one essential point which was to be obtained, to the exclusion of everything else, and he had the fine discrimination which enables one to retain all the means necessary to accomplish the object and to eliminate all others. This enabled him to reduce his inventions and methods to the utmost simplicity without impairing their efficiency, the sure sign of genius. Green's famous shad hatching box, than which nothing more simple and effective has ever been invented for the hatching of fish, is a good illustration of this genius; and his world-renowned skill at fly-casting, rifle shooting and fish catching are only further illustrations of the same thing.

I regret that time and space forbid me giving anything more than this very imperfect sketch of this remarkable man; but I must hasten on.

The other figure which stands out most prominently in my memory, as I recall the early days of American fishculture, is that of one who has been called a plain man. He was a plain man indeed, but one who was made after nature's largest pattern of men. He was large in mental caliber and large in physical frame, large in his broad sympathies and in his wide scope of vision, large in his comprehensive grasp of great aims, and large in his capacity for great undertakings—large in everything, but small in nothing.

You at once recognize, I know, Prof. Spencer F. Baird, the first United States Commissioner of Fish and Fisheries.

The mere mention of Prof. Baird's name strikes a chord of dear memories in the hearts of all who knew him. No man of our time has left a purer memory, a more stainless name or a more animated or enduring influence over his special field of labor than Prof. Baird. He was loved by those who knew him when he was living; he is revered by those who have survived him. Prof. Baird lived in a higher plane of life and breathed a purer atmosphere than most men. Quiet and unassuming, with a nature as gentle as a child's, his natural superiority never failed to show itself when he was with other men, not even among the distinguished men who gathered in the winter at the national capital. Yet he was thoughtful and considerate of his subordinates, and always ready to give his meed of praise of any work well done by his humblest employee. Prof. Baird had the enviable gift not only of endearing every one to him who came in contact with him, but of inspiring them with his own enthusiasm and energy. This made congressmen vote him all the appropriations that he asked for; for it was a common saying at Washington that Congress gave Prof. Baird everything that he wanted. Like a good general, he had the personal welfare of his men at heart while he was Fish Commissioner, and they in turn wanted to do everything in their power for him, which, doubtless, was one of the secrets of his great success. It is a fact that his employees in the Fish Commission would voluntarily work a great deal harder for Prof. Baird than they would for themselves. This fact is prevalent for another saying at Washington at that time, that Prof. Baird's men were the busiest workers in all the departments. It was the inspiration of this patient, disinterested, tireless, kind-hearted and lovable man whose work they were doing that made them work so well, and also made their work a pleasure.

It is unnecessary to say that Prof. Baird possessed extraordinary mental endowments, but I perhaps may mention one or two, as they are so rare. He had a quickness of apprehension that sometimes seemed supernatural. For instance, he would glance down a printed page and comprehend in a moment what would take others several minutes to read.

He had a marvelous memory, not only retentive of everything intrusted to it, but quick to call up anything that was wanted when it was wanted—a quality which most of us know well how to appreciate. His mind was also of the clearest type. No complications ever seemed to confuse him; he never became involved during his conversation, no matter what were the intricacies of the subject. His mind, like his placid temper, never seemed to be ruffled or disturbed. Extraordinary as his mental faculties were, he had evidently added to their efficiency by severe discipline, for he possessed that infallible mark of a well-trained mind; of having all of his great and diversified stores of knowledge classified and grouped together in his brain according to subjects, so that he could call up his whole knowledge of any subject at a moment's notice. Another remarkable thing about Prof. Baird's mental composition was that with a thoughtful, scientific cast of mind were united qualities of the most practical character. Prof. Baird was a scientific man by nature. He loved science and scientific studies; but at the same time no man had a sounder judgment or a clearer head in the management of practical affairs than he did. It is very rare to see scientific and practical qualities of mind united in such an eminent degree as they were in Prof. Baird's.

Prof. Baird was gifted with still another unusual mental endowment which reminds one strongly of one of the traits of the first Napoleon. With that comprehensiveness of mind which takes in the broad features and large general outlines of a great enterprise, he combined, as Napoleon did, a capacity for close and thorough attention to all the details of a subject down to the minutest item necessary to success. This combination, as we all know, is a rare one. As an illustration of Prof.

Baird's wonderfully retentive memory and easy grasp of details, as well as his gift, also remarkable, for a rapid dispatch of practical work, I may mention a little incident that occurred at Calais, Me., where I visited in 1872, and which has fastened itself on my mind ever since. He had received twenty-seven letters by mail of the day before—I remembered the exact number that he told me he had received—and the next forenoon after breakfast he called in his stenographer for the purpose of answering them. As I very naturally rose to leave the room he kindly invited me to remain and be seated, and I shall never forget the impression which the subsequent answering of those letters left on me.

Assuming his customary attitude, when on his feet, of holding his hands behind him, one wrist grasped by the other hand, he leisurely walked up and down the room, dictating to the stenographer the answers one after another to all his letters. He did not, to my knowledge, refer to one of the letters he had received, either to ascertain its contents or to get the address of the writer, but proceeded from one letter to another till all were finished. And, further, during this time he never showed the slightest hesitation, nor did his countenance betray any signs of mental effort or confusion. It was a remarkable feat of memory, and a methodical dispatch of business details which I cannot forbear to mention.

In our subsequent acquaintance and correspondence, which was very extended, both personal and official, his letters were always marked by great kindness of heart and thoughtful consideration, which, it is needless to say, warmly endeared him to me. It is a great pleasure to me now to think that the United States Fish Commission station that I located and built up three successive times, on the McCloud River, in California, has kept the name which I gave many years ago to the little post-office on the river, and as Baird's Station contributes its mite to perpetuating the name of the great first United States Commissioner of Fish and Fisheries.

I said that there were two figures which early association with fishculture called up very forcibly to my mind. There is also a third. It is of a man who has never been in America, yet whose love for America, whose admiration for American fishculture, and whose influence on fishcultural work in America, have been very marked. I mean the Count von Behr. With a thorough love of fishculture, and devoted to it with an unusually enthusiastic nature which specially fitted him for inspiring others with his own love for it, Herr von Behr was to Germany in his field of labor what Prof. Baird was to America. He was for many years president of the Deutsche Fischerei Verein, the national fishcultural organization of Germany, and during his whole connection with it he was the life of the association. He was also the animating spirit of the great International Fisheries Exposition in Berlin, which will forever remain memorable in the annals of the world's fishcultural history.

Though of a wholly different type from Prof. Baird, he nevertheless possessed qualities which caused his influence to overshadow all other fishculturists in his own country, as Prof. Baird's did in this country, and made him *facile princeps* in conducting the cause of fishcultural development in Germany.

It was my privilege to carry on a delightful correspondence with Herr von Behr for several years. Dropping all official forms, and indeed all formality whatever, his letters were earnest, confidential and full of enthusiasm. They expressed the same love and admiration for Prof. Baird that Americans felt for him at home, and never lacked in expression of his great admiration of American fishculture. They also recorded his sad domestic bereavements, and told how, after the loss of his three sons, he had resolved to devote the rest of his life to the cause of fishculture in Germany.

I am aware that much criticism has been expressed because Von Behr's name has been given by Americans to an European trout since its introduction into this country; but whatever may be said of the judiciousness of the act, no one can deny that it was a fitting compliment to a man who richly deserves the honor, nor can any one deny that it reflects kindly feeling which sought in this way to recognize American indebtedness to Von Behr, and to perpetuate in America the name of the distinguished German fishculturist. The Count von Behr was a generous, warm-hearted, lovable man, and his contributions in labor and in influence to the cause of fishculture can never be measured.

He was one of the three who formed the great triumvirate of the early history of fishculture—Seth Green, Spencer F. Baird, Heinrich von Behr.

Hopeful as we are of the future fishculture work of the world, we nevertheless confess to feeling a presentiment that "we ne'er shall look upon their like again." I regret that this disjointed and imperfect sketch must suffice for the present for a subject which deserves better treatment.

I would like to speak of the Hon. Frank Buckland, of England, who did so much to encourage fishculture in Great Britain; of Prof. Milner, who was my zealous and conscientious colleague until his death; of Hon. Robert B. Roosevelt, who edited and published the first newspaper column in this country exclusively devoted to fishculture; of Hon. Theodore Lyman, of Massachusetts, the leading spirit in the first fishculture movement in New England; of John Bellows, of New Hampshire, who took the first step in this country toward the public recognition of fishculture; of Gov. Seymour, of New York, who gave his powerful influence to its support, early in the 70s; and of many others who contributed more or less prominently to its early development—but both time and space preclude the possibility of this, and I can only congratulate my brother fishculturists that there are so many devoted workers in the cause still living to fill in the places left vacant by their faithful predecessors, and who have gone to their reward.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Fishing Up and Down the Potomac.

Goose Creek.

INTO Loudoun county, one of the best in old Virginia; the summit of the Blue Ridge its boundary on the west; with high hills and beautiful valleys; healthy in location, rich as to soil, contiguous to a good market; its people, like Bloomfield's bold yeomanry, their country's pride, are as prosperous and contented, or ought to be, as any in the world. It is therefore with something of a shock comes the news of the recent depredations of the barnburners there. Taking the Washington and Round Hill Railway for five miles toward Alexandria to the Washington and Ohio Junction, we turn west nearly parallel with the Potomac, and passing Arlington and Fort Meyer in the rear, the line goes on to Round Hill, fifty-five miles away. This is the present terminus of the road, lying at the mouth of Snicker's Gap, some four miles off—the gateway through the Blue Ridge into the beautiful valley of the Shenandoah.

Formerly Farmwell, now called Ashburn, a little over three miles from the creek, was the angler's station, a team meeting them and taking them four or five miles away to a farmhouse on the banks of the creek, where they were lodged, minnows furnished when desired, and such other attentions shown as are necessary to the comfort of fishermen.

Our own numerous trips to this place have ended at Belmont Park, three miles beyond and about forty from Washington—only a platform at a crossroad, named from a picnic ground maintained by the railroad some years ago for the encouragement of summer excursions.

Traces of sheds for eating and drinking, and merry-go-rounds, etc., still show on the creek bank under the great trees, but it has long ceased to be a general resort.

A hundred rods from the track is the house of a prosperous contractor and farmer, who showed us such good will and kindness on the occasion of our first visit we have never cared to wander.

Scarcely a half mile from the station platform the road crosses a great iron bridge thrown over the deep chasm through which, 40ft. below, runs a peaceful little stream with hardly enough water to float a launch, save a few yards at a time, though the State is still paying interest, it is said, on bonds floated long ago to make this a commercial waterway; it would not have seemed half so foolish in one of Uncle Sam's river and harbor bills, where it would have found such congenial company.

There must, though, have been at that time much more water than now, or the most credulous would have hesitated to invest; but the ruins of three or four great locks still stand along its banks, mute but eloquent witnesses to the o'erleaping ambition, the futile energy, the mistaken calculations of a former generation, who must have spent thousands in this vain effort.

One boat did get up, but never came back. Its decayed remains are far up the creek, almost as distant from a channel as was the ark on Ararat after the deluge. A skiff could only get up the stream now by being carried.

Goose Creek is formed by Crooked Run and Gap Run on both sides of Lost Mountain, with Jeffries's Branch and Cromwell's Run. Into the main stream just above Oakland runs the North Fork, fed by its tributary, one of Virginia's many beaver dam creeks. A hundred yards below the railway bridge Sycoline Creek comes in from the west, and still further down the Tuscara. The main creek reaches the Potomac opposite Edward's Ferry, a name familiar to every angler who has ever cast hook in this queen of bass rivers.

The fish in Goose Creek, like the most of those yet taken in the upper Potomac, are the small-mouthed bass. These come up from the river easily in ordinary stages of water, and the United States Fish Commission has made plants in the creek itself.

The water in good seasons is of the best, and the fish gamy and good. The pleasantest fly-fishing is above the bridge, where the ruins of locks and dams have in places filled the bed of the stream with broken rocks. The banks are heavily wooded and mostly thick of underbrush, which makes bank fishing only possible in spots; and treacherous holes in the longer reaches make wading dangerous, so that there are better streams for the peripatetic angler. But to one who prefers bait fishing there are charming places where it would be a delight to spend some hours with rod and line, if one did nothing but dream the time away.

"If so be the angler catch no fish, yet he hath a whole-some walk to the brookside, pleasant shade by the sweet silver streams; he hath good air and sweet smells of fine, fresh meadow flowers; he hears the mellow harmony of birds," said Burton in his "Anatomy of Melancholy," and that idea he fished bodily from Dame Juliana Berners, and gave no credit; this was far from sportsmanlike, and unworthy a true and gallant angler, which probably he was not, or he never would have made so large and varied a collection of "blue devils."

One good trout on a bending withe is potent enough to put to rout a whole regiment of evil spirits and megrims, and no man could analyze Melancholy with a rod in his hand, for she would never come near enough to be touched. So if Burton had fished, the world had probably lost a literary treasure.

One of the maxims laid down in the "Angler's Guide" by T. F. Salter, Ghent, 1816, was: "Continue to cast your line in search and fish every-yard of water likely to afford sport, and never despair of success."

A very pretty illustration of the soundness of this advice was given me on our last visit here. My companion had been watching a bass breaking in the eddy at the mouth of Sycoline Creek. A shoal of sand ran down midstream from the pier of the bridge, and reaching this, he waded cautiously down until nearly waist deep. Here the sandspit sheered down to deep water, and he could go no further. He cast again and again, but was at least 20ft. short. Dusk was approaching, and putting up my rod, a seat on the bank at the end of a fair day's sport was pleasure enough.

It was that charming angling author, Prime, who said: "I believe I am sincere in saying that I enjoy seeing another man throw a fly, if he is a good and graceful sportsman, quite as much as doing it myself."

My friend continued his efforts for ten minutes—

twenty, apparently—without the slightest effect. The bass seemed to find plenty to amuse and comfort him in the little swirl near the center of the eddy, where, among the circling bubbles, he probably found floating flies. At any rate, every few minutes he came up with that attractive sound that suggests Chimmie Fadden's little "cold bot," and giving us a tantalizing glimpse of a broadside that put new steam each time into the flying line. Sitting high above, it seemed to me the fish began to break a little nearer to the fatal lure. The fly and fish were each time a trifle closer together; ten minutes later there was a wild rush, a little cheer of congratulation from the watcher on the bank and the two boys who carried our impedimenta, and after a pretty struggle in the open water the bass, which was a big fellow, came to net.

It was a triumph of skill and patience. My own would have been exhausted long before, and this shows the effect of education and early training on disposition.

His fly-fishing had been done mostly from a boat in the lower Potomac, where the water is always new, since the fish move about with the tides, and one may cast in the same spot repeatedly with always a new chance for reward. My own early experiences had been on Western lakes, where the bass had a local habitation about a stump or moss-bed, or under the great peltate leaves of the nelumbium, which, shading a 3ft. circle as they float on the surface, are favorite shelters for the bass. A cast or two about such likely spots will tell the tale, and if there is no immediate response the angler may as a rule count further effort as love's labor lost, and finds more profit in moving on.

But this incident made its impression, and the lesson learned brought its own reward later in the shape of a good basket of 2lb. bass, after an hour's painstaking labor on a school in plain view had brought only despair, and the rod had been unlimbered, when, this picture recalled, incited one more determined effort with surprising results; but that is another story.

Every season parties from Washington or elsewhere camp somewhere along the banks of Goose Creek for an outing, and on this trip two ladies were keeping house in a neat little tent in a sheltered spot not far from the stream. One of these, as we passed, was perched high on a huge rock in the creek, trying hard to beat her own record of the day before, when she had, unaided, landed a 4lb. bass. Her husband, indignant at being outdone by a woman, had thrown down his rod just before our visit, and gone gunning for squirrels. He tried later, in town, to explain to us that anxiety for fresh game had driven him away, but we knew it was jealousy. On one occasion here a friend was in the party who was new at fly-fishing, though he had caught trout in Erin's waters, and is altogether more familiar with the habits of nature's wild people than any other of my acquaintances. He is an ardent sportsman, and his excitement over his first big bass on a fly would have given Niobe fresh occasion to turn on the pumps. Twenty times he thought his fish lost, and as many times he had him won. His shouts alternated between exultation and despair. Every struggle the poor fish made scared him into an ague, and when a kindly disposed but ill-advised neighbor proffered assistance his indignant protests were voluble, lurid and excruciating. He wanted all that side of the creek, and kept saying so emphatically—so emphatically, indeed, that even the dumbfounded neighbor understood that much. When the bass finally came to net and was held up for inspection, a me and Napoleon smile came to him, and \$10 would have been no price to insult him with for that particular fish.

HENRY TALBOTT.

CHICAGO AND THE WEST.

Short Fish and Charity.

CHICAGO, Feb. 5.—Deputy Wardens Ratto and Goetter are on the trail of the dealers who sell fish of illegal size. On last Monday H. H. Regenburg was fined \$25 for selling two pickerel which had not yet attained legal length. Under the act the presence of short fish in a shipment subjects the lot to confiscation, and many hundreds of pounds of fish have been seized for this reason. Such fish have been turned over to the county agent, who has been distributing them to worthy applicants for charity. The poor folk of Chicago have been blessing the new fish law this week, and they may thank the local deputies for their vigorous prosecutions. In the eyes of some it may be rough on a dealer to take away a barrel of fish from him when the lot contains but one or two under-sized fish, but it is hard to see where the justice of this commiserative feeling exists. If the dealer has not bought the fish, but has received them for sale on commission from some country shipper, then the dealer has suffered no loss unless he has paid the freight charges, which, of course, he will charge back to the shipper. Incidentally he will, after one or two seizures of this kind, be sure to write to such shipper and tell him to be careful not to send any more short fish. If the shipper cannot sell these short fish he will not ship them and will not catch them. This is the law in practical working shape, and in no other shape is it practicable or is it law.

White-winged peace now sits over the troubled waters of the Illinois River. The State Fish Commission has explained to the irate fishermen of Peoria that no discrimination has been intended or will be made against Peoria fishers, or in favor of firms of other localities. The Peoria Star, which led the kick against the Commission, publishes an interview in which it is explained why Deputy Brassfield was warned not to make too many prosecutions of net fishermen. It is stated that he was asked simply to confine his ardor to his own territory, and not to interfere with fishermen elsewhere who were using nets construed by the Commission to be of legal mesh. The work of the Illinois Commission is an important one, and naturally it should apply rather to food fish than game fish. Yet if it be true that the State Fish Commission allows 1/4 in. for shrinkage after a net is tared, the situation is left rather whimsical than serious. To a fish trying to butt its head through a 1 1/2 in. mesh it makes no difference that the mesh was 2 in. or 3 in. wide when it left the factory. Are we to infer that the State Legislature intended to protect the fish or the hole?

Maybe I am too curious about these things, but I was just wondering. I am going to ask Mr. Bartlett about this the next time I see him, because I want to know how a 2 in. fish can go through a 1 1/2 in. hole. Also, I would like to ask him how can the Illinois State Fish Commission, by taking thought, add a cubit to the stature of a South Water street pickerel which only measures 11 in. alongside a plain, hard wooden rule with inch marks on it? I have known even children to ask some beastly hard questions. Of course it is hard to see how a sportsman's paper can ask for anything less than the letter of the law from the dealers who do so much to interfere with sport, and who have so long had the matter of the interpretation of the law in their own hands.

1206 ROYCE BUILDING, Chicago.

E. HOUGH.

The Nessmuk Club.

ALTON, Ill.—Editor *Forest and Stream*: I send you herewith a copy of the constitution of a new sportsmen's club just organized in this city, thinking that it may be of interest to you as showing that the memory and the good work of one whom FOREST AND STREAM introduced to the world of sportsmanship is still working for good out here in the Mississippi Valley.

The island thus leased by the Nessmuk Club is one of the best in the Mississippi River, comprising over 300 acres, and mostly in the primeval forest state. It is distant five miles up the river from this city, and the club members, who are all active business men of the world, hope to make during the year many yachting trips to the grounds, to spend a day or two in quiet, oblivious forgetfulness of the worry and fret of common affairs.

The island commands a long reach of river sandbars where duck shooting is still good on occasion, and it is well stocked with squirrels, raccoons and other wild game, having also a natural basin that may be converted into an ideal fish preserve.

A trap and rifle range will afford pastime for those who like practice at inanimate marks. F. C. RIEHL.

We give the Nessmuk Club's form of constitution for the benefit of other club projectors:

CONSTITUTION.

Article I.—Name and Purpose.

Sec. 1. This organization shall be known and styled the Nessmuk Club, of Alton, Ill.

Sec. 2. Its object shall be the occasional outdoor recreation and entertainment of its members and friends.

Article II.—Property and Privileges.

Sec. 1. The property of this club shall consist of twenty memberships, representing a five-year lease of the hunting, fishing and recreation privileges of an island in the Mississippi River, located in Madison and Jersey counties, Ill., and commonly known as Scotch Jimmie's Island, with the privileges attached thereto.

Sec. 2. These memberships shall be and remain pre-eminently the property of the club and shall be non-transferable; they shall be rented at a given sum annually to individual members, and each membership shall be subject to recall at any time upon a vote of a majority of the active members of the club.

Sec. 3. Applications for membership shall be filed with the president or secretary at least one week in advance of a meeting, due notice of the fact being given, and elections shall be by ballot, three black balls being deemed sufficient to reject applicant.

Sec. 4. The initial cost of memberships, per annum shall be \$5, payable invariably in advance upon the beginning of each and every year, dating from the first of March.

Article III.—Officers.

Sec. 1. The officers of this club shall be one president, one vice-president, and one secretary and treasurer.

Sec. 2. There shall also be an executive committee of five members elected annually, to include the president and secretary as ex-officio members.

Article IV.—Duties of Officers.

Sec. 1. The president shall call and preside at all meetings, and conduct the same according to parliamentary usage, and shall have general supervision of the affairs of the club.

Sec. 2. The vice-president shall have all authority and perform the duties of the president in the absence or inability of that officer to serve.

Sec. 3. The secretary and treasurer shall keep an accurate record of the business meetings of the club and executive committee, conduct correspondence, and in general do the clerical work of the club. He shall also receive and account for all moneys belonging to the club, keep a full financial record and pay bills upon the order of the executive committee.

Sec. 4. The executive committee shall have general supervision of the grounds and its improvements. It may appoint a superintendent of grounds and meet any emergencies that may come up, reporting the same to the club for ratification.

Article V.—Government.

Sec. 1. Robert's "Rules of Order" shall be considered the code to regulate as nearly as possible the business proceedings of this club.

Sec. 2. Nessmuk's "Woodcraft" is hereby adopted as the guide to regulate as nearly as possible the conduct and habits of deportment of members and of this club while on the grounds.

Sec. 3. Members inviting strangers will be considered responsible for their conduct and for any indebtedness they may incur to the club.

Boston Winter Notes.

BOSTON, Feb. 7, 1898.—Winter fishing has received a natural check that will scarcely be gotten over till it is time for the ice to thaw. New England has been visited by one of the heaviest snowstorms ever recorded, and it is almost impossible to reach the lakes and ponds except with the aid of snowshoes. All the plans for pickereeling are abandoned for the present, and for the season, if the snow is followed by a sudden thaw.

The New England Sportsmen's Exhibition here in March is attracting a good deal of attention already. Mr. R. O. Harding, of Appleton & Basset, has just returned from Maine, where he was nearly snowed in. He visited the Lake Auburn fish hatcheries with Commissioner Stanley, and has the promise of some beautiful trout and landlocked salmon for the exhibition. He has also secured other exhibits of live fish. The Government fish transportation car has also been secured and will be forwarded by the railways free. At a meeting of the Maine Hotel Association at Waterville last week particular force was accredited to what the fish and game interest is doing for the hotel men, while the usual flowery speeches were made about the "inexhaustible supply of big game" and the great efforts the State is putting forward in restocking her waters with landlocked salmon, all of which sounds well, and would be well, if the reality was up to one-third of the advertising. I suppose that it is fated that the summer vacationist must follow the lover of the rod and reel and the solitude of the woods and waters into his farthest retreat. This year he can hunt and fish in close communion with nature; next year the fashionable hotel and the brass band are there.

BENCH SHOWS.

Feb. 15.—New England Kennel Club's fourteenth annual show, Boston. James L. Little, Sec'y.

Feb. 21.—Westminster Kennel Club's twenty-second annual show, New York. G. de F. Grant, Sec'y.

March 1.—Baltimore Kennel Association's third annual show, Baltimore. W. P. Riggs, Sec'y.

March 8.—Northwestern Kennel Club's dog show, St. Paul, Minn. C. E. N. Howard, Sec'y, St. Paul, Minn.

March 15.—Kansas City Kennel Club's second annual show, Kansas City, Mo. A. E. Ashbrook, Sec'y.

FIELD TRIALS.

Feb. 7.—Alabama Field Trial Club's second annual trials, Madison, Ala. H. K. Milner, Sec'y.

American Kennel Club.

Report of Constitution and Rules Committees.

NEW YORK, Jan. 24.—To the American Kennel Club.—Gentlemen: Three amendments to the rules were recommended by Mr. James B. Blossom; notice of two of them was given at the meeting of the A. K. C. of Dec. 16, 1897, and referred by that meeting to this committee. The third notice was presented to this committee at one of its sessions—By-laws, Section 3, Rule 12, Class 6. After the words, "one of which must be in the free-for-all class," add the words, "and one in the senior class," and after the words, "No class winner can be withdrawn from competition in the winners' class," add the words, "except those dogs which have already won their championship." Also an amendment to abolish the puppy classes. These amendments are not approved by your committee, as will appear later in this report.

The amendment recommended by Mr. G. M. Carnochan at said December meeting, and also referred to this committee, reads as follows:

"That at all bench shows dogs having won a prize in any class shall not carry the ribbon showing such win in any subsequent class at the same show."

Your committee believes that the object of the above amendment is a good one, but disapproves of its adoption, upon the ground that it would not be practical, and the inability to enforce such a rule would make it a dead letter.

The objections to the new classification that are now found to exist, and the presumed hardships, as have been claimed by correspondents, that would hamper and discourage clubs from holding shows, cannot be blamed to your committee, and it most decidedly declines to assume the responsibility of the cause that has led to the present opposition to said classification. Your committee did not in any sense initiate the change, and as it has no personal motive in attempting to maintain the classification, nor is it at all wedded to it, therefore it will at the coming annual meeting recommend a change that will in its opinion remove all cause of complaint by both show committees and exhibitors. The committee feels that in justice to itself it should make the following explanation of its action, and place the blame, if any exists, just where it belongs.

Early last spring a decided desire was expressed by several of the delegates that a new classification should be adopted, following more closely in the lines which govern English shows; that the old classes were misnamed and therefore misleading; that through and by a little good management mediocre dogs were winning championships by virtue of non-competition in the challenge class, and that the increased interest in dogs and the increasing number of shows demanded a new set of classes, properly named and in keeping with the general advance of kennel affairs in this country. English classifications were obtained from abroad and sent to your committee, which was urged to recommend a similar classification. The classes and their definitions certainly appealed to the judgment of the committee, and after a number of sittings the present classification was evolved, the names of the classes being Americanized. That the work entailed a vast amount of labor should be obvious to all thinking persons.

After completing its labor, and before publishing the report in the Gazette, one proof copy of the report was sent during July to the Pacific Coast Advisory Board and one to the then existing Canadian Advisory Board, with a request to said boards to consider the rules carefully and recommend any changes that might be deemed necessary for the best interests of the particular territory over which they had jurisdiction. During the visit of your secretary, who is also a member of this committee, to San Francisco in August following, he, at a meeting of the Pacific Advisory Board, at which a large number of members of specialty clubs, breeders and exhibitors were present, requested a discussion on the subject of the then proposed rules, no one, with but one exception, evinced any interest whatever in the proposition, and did not respond in any way to the invitation. At no time during the stay of your secretary in that city was he given to understand that any objection to the rules existed. In the meanwhile the agreement with Canada was annulled, and therefore no recommendations on the subject of rules were expected from that quarter. The report of your committee was published Aug. 31, and when the rules finally reached your body for final action at the September meeting they were adopted with but a few minor changes.

To show further, each club knew, or should know, just what was being done, and by their silence and failure to instruct their delegates to suggest changes, or vote against the measure, practically gave consent and indorsed the rules. It would be well for you to remember that the proposed rules were published in full in the Gazette, and a copy of them was duly mailed to each delegate, and an additional copy to each club, through its secretary, and therefore, with all the publicity given to the matter, it naturally became a fair inference that no objection existed to their acceptance and final adoption. Further discussion was invited by several of the sporting papers, but none of any account was had. Private letters have been received of late from men holding office in clubs objecting to the rules as they now exist, and suggesting certain changes and modifications. One of the

leading Pacific coast clubs believes that the money qualification demanded for winners' class will handicap the shows on that coast, and suggests that an exception be made for that territory. One of the leading Eastern clubs expresses dissatisfaction, while, on the other hand, the rules are highly commended by many. Undoubtedly many wrong impressions exist, interpretations of rules that appear simple are asked for, and they appear generally to be misunderstood.

The greatest objection, as it appears to your committee, is the cash prizes that must be given in three classes, in order to prove a winners' class. This is a very small matter, if it is understood. Your committee, foreseeing that to specify any amount might be a hardship, purposely left the amount to be determined by the clubs according to their means and location. The sum of \$1 per class, in three classes, would comply fully with the rule, and therefore your committee cannot believe that such qualifying clause can have a very great effect upon any club or in any location. The object in holding shows should be to improve the dog; to improve the dog competition is required, and although a good dog may win its championship in less time under the new classification than under the old, yet it demands a better dog to do it. Your committee believes that the present rules are a marked advance over the old ones, and having now plainly stated the facts that led up to the adoption of the present rules, and reiterating the statement made earlier in this report, that it has no personal motive for attempting to maintain these rules, but on the contrary is anxious to meet the evident wishes of gentlemen who are and have been closely connected with the holding of shows for years, is ready to submit, and does hereby submit, for your consideration a new classification which it is hoped will meet with the approval of the show-holding members of your body, and would recommend the adoption of the same at the annual meeting of the club to be held Feb. 23 next. Ample time is now given to every club to instruct its delegate, if it desires or cares to suggest any changes.

Classes.

1. The puppy class shall be for all dogs over six months and under twelve months of age. No entry can be made or accepted of one under six months of age, or whose date of birth is unknown.

2. The novice class shall be for all dogs never having won a first prize at any recognized show, wins in the puppy classes excepted.

3. The limit class shall be for all dogs never having won four first prizes at any recognized show, wins in the puppy and novice classes excepted.

4. The open class shall be for all dogs of any age over six months.

5. The winners' class shall be open only to the winners of first prizes at any show, giving at least three of the beforementioned classes, one of which must be the open class, and the winner of three first prizes in this class will thereby become a champion of record, be so registered by the American Kennel Club, and will be entitled to an American Kennel Club champion medal. Before awarding "reserve" in this class, the dog or dogs having been placed second to the winner in any of the regular classes must be brought before the judge for competition with the remaining dogs in said winners' class. No class winner can be withdrawn from competition in the winners' class, and no entry fee shall be charged for said competition in this class. A dog that has already won one or more first prizes in the late challenge classes shall retain these wins to its credit toward becoming a champion of record, the remaining qualifying wins to be gained in the winners' class. The winners' class can be divided by sex, provided the required three classes are also divided by sex.

The above classifications to go into effect at once.

Your committee would further recommend that Article XIII., section 4, constitution, be amended by striking out the entire section. The reasons for such recommendation are, first, that it is found to be impossible to create enough interest to be able to secure a quorum, and as a consequence no meeting has been held since August last, notwithstanding the fact that matters are in its hands that should have been attended to promptly; second, it is the opinion of a number of members of Pacific coast clubs that the existence of such a body on the coast is not necessary. It has been for months practically a dead letter, and its abolishment is recommended. Finally, if such recommendations as above referred to are adopted, it will be necessary to strike out in the rules, following the classes, all references to the classes that have ceased to exist.

H. K. BLOODGOOD, Chairman for Committee.

Note.—The above report of the constitution and rules committee was mailed to the secretary of each club on the Pacific coast on Jan. 26, 1898, together with the following questions to be answered and reason for asking such questions:

To Pacific Coast Members.

What are your wishes regarding the continuance of the Pacific Coast Advisory Board?

If you are in favor of its continuance, in what manner would you desire its formation?

The reason for asking these questions is that several members of Pacific coast clubs have expressed a wish for its abolition.

Further than that, no meeting of the advisory board has been held since August last because of lack of a quorum, and important business that cannot be acted upon by the A. K. C. until reported upon by the advisory board is thus delayed.

Meanwhile, as no alteration of the constitution can now be made except at the annual meeting, and of which notice has been published in the January issue of the Gazette, the committee has paved the way for any desired change by giving notice of an amendment to do away with the advisory board altogether. If nothing is heard from the recipient of this notice the presumption will be that the member favors the abolition of the board. All suggestions will be presented as amendments at the annual meeting by the committee on rules, if the member is not represented by a delegate.—*January A. K. C. Gazette.*

Bench Show Clubs and Exhibitors.

BOSTON, Mass.—*Editor Forest and Stream:* The question of prizes has this season come into peculiar prominence. The action of the New England Kennel Club in cutting down its prize list has raised many protests from those who feel that they will be losers by this club effort at retrenchment. No argument is raised against it but the selfish one that what the club withholds is lost to the exhibitors. They strenuously maintain that an exhibitor desires to make his expenses from the prize list.

Some even go so far as to denounce the management for its act in reducing the premiums. They seem to think that they have been unjustly deprived of something they really owned, something that the club held only in trust. If this be true, the club is then not really the owner of its own money.

However, the exhibitors cheerfully accord to it the privilege of footing all losses by itself. They have performed their part when they show their dogs, make their sales, advertise their kennels, arrange for stud fees, and attend to all the other details of their business in the expeditious manner which can be done at a bench show, and at a bench show only. But, hold—that is not all. I had almost forgotten that their duties were not ended till they had collected their prize money.

It is a well-known fact that the rapacity of many of the exhibitors has no perceivable bounds. Most of the bench show clubs have catered to such rapacity to a degree beyond reason. Every concession was but the prelude to others, and greater ones.

For much that is against the club's interest in these matters the clubs themselves are entirely to blame. In the erroneous belief that great inducements in the way of prizes were necessary to induce exhibitors to attend to their own business, club managements kept themselves impoverished. They failed to perceive the fact that the greater part of the exhibitors were either professional dog breeders, or partly such, and that there was not one who was averse to turning a penny or two of profit on proper occasion. They overlooked the fact that the shows were the very life of the dog breeders' business. If the breeder stayed away, his business decayed and in time was entirely lost.

The exhibitor who showed his dog from the feeling of pride and affection which he bore to him was rewarded enough by the honors won. All matters of money were to him an insignificant detail in comparison with the honors.

Why an exhibitor, on any just principle, can assert that the club should offer money enough to pay his expenses is beyond my powers of discernment. The club could with quite as much justice insist that the exhibitors should pay the expenses of the club. On that part of the affair, however, they have always been unanimously and discreetly silent. It makes quite a difference whose ox is gored. If the exhibitor who wins has a right to have enough to pay his expenses, why has not the exhibitor who loses also a right to remuneration for money expended? In this matter the objectors ignore the fact that the club has a perfect right to offer any amount of premium it chooses, and that the exhibitor who will not come without being paid to do so is free to come if he chooses. He is free any way he is pleased to look at it. No one can compel him to attend to his own business if he does not care to do so.

The offering of big cash prizes for the handler bringing the greatest number of dogs to the show in one place, the offering of a big cash prize so placed that a handler with a great number of dogs was sure to win it, and the direct paying of a part or all the expenses of some handlers, has done much to convince some exhibitors that some one else than themselves should pay their expenses. It was all wrong on the part of clubs to bring about such a way of dealing. It was quite as wrong for any one to ask them to do it. It is not too late to let the man alone who will not attend to his own affairs if some one will not pay him for it.

New York is cited as a glorious example of a show which has not cut down its premium list. The critics are silent on the circumstance that there is only one New York. No other city in America has such support from the public. No other city can charge such an admission fee and have so many visitors. No other city has the same prestige, facilities, field. It can give a big premium list. It can be certain of a big support in return. It is peculiar in itself. It is a standard beyond the aspiration of other cities.

It is a notorious fact that nearly all the bench show clubs have been financial losers. Never have I seen a word of sympathy, much less an act of support, from the men whose names have been affixed to protests against any lessening of the money for prizes. The members of the clubs might be as far in a loss as might be; that was their own affair. The exhibitor had only to do with his own interests. He quite did his share when he looked to the sufficiency of the premium list. The deficit was for others to attend to.

If bench shows were profitable ventures, paying big returns for the money invested and the time and skill devoted to them by the members of clubs, there might be some ground for arguing for a greater premium list. In view of the fact that most of the shows are run at a loss, that at best it requires a great deal of care, anxiety and effort to come out even, it is far better for the exhibitors to be content with the shows which are offered them, rather than to be discontented because they have not both the show and the management's money.

CAPE COD.

A. K. C. Executive Board.

THE executive board of the A. K. C. met in the club rooms, 55 Liberty street, at 2 o'clock on Feb. 7. Present, Messrs. Edw. Brooks, Jas. Watson, G. M. Carnochan, H. F. Schellhass and H. K. Bloodgood.

In the matter of Robert Hoodless versus the Kentucky Kennel Club, it was ordered that the club and officers be suspended under the rules.

In the matters of the Irish setter Hunter, owned by P. F. O'Neil, it was ordered that the win having been canceled, no further action is needed. This refers to a win at the Brooklyn show.

In the matter of the American Spaniel Club versus Toon & Thomas, this firm was suspended until Jan. 1, 1899.

All entries at Wilmington and Grand Rapids which were marked in the catalogue "reg." the wins of the dogs so catalogued, if any, were ordered canceled, and the clubs were ordered fined for such violation of the rules.

The deposit made by the Toronto show of 1897, with its claim for dates, was ordered returned.

E. S. Gordon, of Willimantic, Conn., made charges against Julius Herold for advertising dogs for sale with fraudulent pedigrees. Mr. Herold was suspended.

Claims for kennel names were granted as follows:

"Ardenia," to J. L. Arden.
 "Clifton," to R. S. McCree.
 "Imperial," to Dr. L. G. Knox.
 "Iroquois," to L. Loring Brooks.
 "The Meadows," to Kernochan & Stevenson.
 "Round Plain," to John Caswell.
 "Summit Ridge," to F. W. Dickson.
 "Woodhaven," to Whiton & Little.

The following officers were elected by the associate members: President, H. H. Hunnewell, Jr.; Vice-President, Dudley Winthrop; Secretary, James L. Kernochan; Delegates, A. Clinton Wilmerding, H. K. Bloodgood, G. W. H. Ritchie.

The International Field Trials.

FOREST, Ont., Jan. 31.—*Editor Forest and Stream:* Protests were entered by W. B. Wells, Hes. Milkins and W. W. McCain against the awards made by the judges in the all-age stakes of the International Field Trials held at Mitchell's Bay, Ont., in November last.

The executive committee of the International Field Trials Club met at the Rankin House, Chatham, on Wednesday, Jan. 26, to investigate the matter. The following members of the committee were present: Dr. Nicholls, Dr. Totten, Montague Smith, J. Kime, C. R. Atkinson, Jr., W. D. Tristram, Thomas Gutridge and A. Wells.

I inclose you copy of the unanimous finding of the committee, which was arrived at after a long and patient discussion of the facts as placed before them. Mr. Wells was the only one of the protesting parties present.

MONTAGUE SMITH, Sec'y Committee.

Whereas, Protests have been entered against the decisions of the judges in the all-age stakes of the International Field Trials Club, held on Nov. 16, 17, 18 and 19, 1897, on the ground that relations existed between one of the contestants, Richard Bangham, and one of the judges, W. E. Warner, in that the said Bangham, prior to and during the running of the said all-age stakes, accommodated the said Warner by becoming surety for the payment of a debt due by said Warner to one P. Farrell, of Woodstock, the knowledge of which was not communicated in any manner to any person whatever by the said Bangham until some time after the judges' awards had been made; and this committee having heard the evidence and statements adduced by the parties protesting and in reply thereto, and being of opinion from the evidence before them that the said Bangham acted in the matter without any dishonest motive or intent, but solely to save the said Warner from arrest, the said Warner having endeavored first to see the secretary of the club, who is one of the protesting parties;

This committee therefore resolves that the secretary-treasurer be instructed to pay over the stakes in the said recited all-age stakes to the parties found to be entitled thereto by the award of the said judges.

And it is further resolved that this committee is of opinion that the said protests were entered in good faith, and on grounds which in the interests of the club demanded investigation.

And it is further resolved that this committee, according to the evidence, is of opinion that the judge, John Davidson, be exonerated from any charge that may or might be inferred against him regarding said protests, and believe that he acted fairly and honorably in making his awards at said trials.

And it is further resolved that this committee censures in the strongest terms the actions of the said Bangham as a contestant in said stake, and as an officer of this club, in that he did not report his actions regarding his accommodation to said Warner to each of the contestants in said all-age stake, and to the secretary and other officers of the club, at the first opportunity, and recommend in the interests of the club that the said Bangham do forthwith forward his resignation as an officer thereof to the secretary.

And it is further resolved that this committee condemns the action of said W. E. Warner in placing himself under obligations to any contestant or other person interested in said trials, and thereby rendering himself liable to be charged with being biased or prejudiced in arriving at his decisions.

(Signed)

J. L. NICHOLLS, Chairman.
 MONTAGUE SMITH, Secretary.

[The above finding is painfully inconsistent. First it is declared that Mr. Bangham "acted in the matter without any dishonest motive or intent, but solely to save the said Warner from arrest," and then he is censured in the strongest terms as a contestant and officer, etc. The act of Mr. Bangham, under the circumstances, was sufficient to cast a cloud upon the wins and to warrant their cancellation. To allow them to stand as above does not in the least free them from impropriety and suspicion.]

POINTS AND FLUSHES.

The annual meeting of the A. K. C. will be held in Madison Square Garden Feb. 23, at 2 o'clock P. M. Immediately following the meeting of the club a meeting of the executive board will be held.

The Western Canada Kennel Club, Winnipeg, in its premium list among other things has this to say to its friends: "The club is not a joint stock company, and its members have no pecuniary interests in its financial success or otherwise, beyond a philanthropic desire to

encourage holding strictly amateur field trials and bench shows, and the recovery of lost, stolen or strayed dogs registered with the club." It is to be regretted that every city in the United States has not its own organization inspired with the same purposes.

The St. Bernard Club of America was resuscitated recently. Mr. Jacob Ruppert, Jr., is president, Mr. Dudley E. Waters secretary. It cannot be the old club, inasmuch as that club went officially out of existence some months ago, but it undoubtedly can be a better one if it can maintain interest and action in its affairs.

At the American Horse Exchange, Limited, Broadway and 50th street, New York, on Friday, Feb. 25, at 2 o'clock, there will be a combination sale of dogs. Entries close Feb. 22.

Kennel Notes.

SALES.

Mr. F. C. Moxham has sold
 Allie M., beagle dog, to Mr. Wm. M. Stambach.
 Lizzie, beagle bitch, to Mr. B. Borrowman.

BRED.

Mr. G. G. Williamson's English setter bitch Oneida F., Dec. 28, to Albert Lang.

Canoeing.

American Canoe Association, 1897-98.

Commodore, F. L. Dunnell, Brooklyn, N. Y.
 Sec'y-Treas., C. V. Schuyler, 309 Sixth avenue, Brooklyn, N. Y.
 Librarian, W. P. Stephens, Bayonne, N. J.

Indian Canoe Models.

Editor Forest and Stream:

The canoe birch (*Betula papyrifera*) is found, according to Gray, "from N. Eng. to N. Penn., N. Ill. and Minn., and far north and westward." No doubt the area in which the birch canoe was manufactured coincided with the distribution of the tree.

In this region were different Indian tribes, and each

tribe had its own model for canoes. It would be a valuable contribution to ethnology if each reader who has accurate information on the subject would send it in.

The first outlines given were taken from a small model canoe, made by Indians of Halifax, N. S. These were probably Micmacs. The other outlines were drawn from memory of canoes that I have seen, but what tribes used these models I cannot tell; perhaps some other reader can. ERNEST SETON THOMPSON.

The Wawbewawa Smoker.

THE Wawbewawas again entertained the Boston canoeists at their cozy club house on the Charles River, Auburndale, Mass., on Saturday evening, Jan. 29.

The third smoker of the winter season was right up to the Wawbewawa standard, and the three-score canoeists who gathered for the occasion can testify to its success.

Plenty of good music was furnished by the entertainment committee, and A. C. A. matters were freely discussed by a representative body of Eastern Division paddlers.

Rear-Commodore R. H. Hammond came down from Worcester, ex-Vice-Commodore Raymond Apollonio and ex-Purser R. N. Cutter came from Winchester, Parry C. Wiggin, of the executive committee, Fred Wallace came from Lawrence, and among other well-known A. C. A. men present were: Vice-Commodore Louis S. Drake, Purser Francis J. Burrage, Louis A. Hall, Charles F. Dodge, Wm. V. Forsaith, T. A. Apollonio, H. L. Bosson, Harry C. Wiggin, L. S. F. Hoffmann, J. Winn Brown, Charles T. Estabrook, Frank R. Kimball, Clarence B. Ashenden, Frank T. Ashenden, Clifford Kimball and Henry W. Langley, representing the Tatassit Club, of Worcester; Fish Brook Association and Lawrence C. C., of Lawrence; Shu-shu-gah, of Winchester; Puritans, of Boston; Innitous, of Woburn; Waltham and Wakefield clubs, and the Wawbewawas.

The committee in charge of the winter's entertainment consists of Louis S. Drake, Louis S. F. Hoffmann, Wm. V. Forsaith, Francis J. Burrage and Louis A. Hall.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Atlantic Division.

H. L. Stevens, New York.
 Frank U. Gregory, Brooklyn.
 Fred'k E. Driggs, New York.

Eastern Division.

Edward E. Eaton, Wawbewawa C. A., West Newton, Mass.
 Roscoe R. Perry, 27 Pratt street, Allston, Mass.
 Lincoln D. Hatch, 7 Gannett street, Roxbury, Mass.
 Willis G. Bancroft, Wawbewawa C. A., Auburndale, Mass.

Yachting.

THE formation of the Inland Lake Yachting Association adds another body to the list of local organizations devoted to the advancement of yachting, and in fact completes it for the present. The clubs of the inland lakes of the West, some twenty in all, have made up the only group not united in a local association; and though there has been no lack of life and activity within the clubs, in the absence of such an association and of the uniform rules which it enforces, the racing as a whole has suffered. The formation of the new association is likely to bring about the same result as in other localities, such as Boston and New York—improvement of the rules, better management of races and renewed interest both in local and interclub events. The conditions on such waters as Lake Minnetonka, Lake Geneva, Fox Lake, White Bear Lake, etc., favor one form of yachting, the racing of small racing craft. There is little chance for the cruiser or knockabout in any form; the waters are too limited in area, but there is no other place in the country where the conditions are so favorable for the development of the extreme racing machine, and of very high speeds, in classes such as the 15 and 20-footers. With the efforts of the local owners and designers of the different lakes centered on two or three standard classes, instead of on a dozen or more different classes, as in the past, very great improvements in speed may be looked for. The new association has our best wishes for its success.

Knockabouts and "Raceabouts."

NEARLY a year ago the FOREST AND STREAM suggested a new name, "Raceabout," as far more appropriate than the original term knockabout for the 1897 models such as Hazard, Fly, Gosling, Mongoose, etc., designed and used solely for racing. Though nominally within the official limits of the knockabout class, such boats are really very different from the real cruising craft which gave a name to the type.

This year a new class has been created, with 600 in place of 500sq.ft. of sail, still more of a racer, and the name "Raceabout" has recently been suggested by a correspondent of the Boston Globe, and advocated by that paper as follows:

The name "Raceabout" for the new restricted class of 21-footers, with 600sq.ft. of sail, seems to have "caught on" with the yachtsmen, and is likely to be adopted in place of the term "knockabout," which applies strictly only to cruising boats with a stem-sail rig.

In bringing out the name the Globe followed the suggestion of a correspondent, but the writer has since had his attention called to the following extract from an editorial in the FOREST AND STREAM, in its issue of March 6, 1897, in which is given a resumé of the new boats to come, and in which mention has just been made of the Seawanhaka 20-footers:

"The next size, the 'raceabout,' or the 'fin de siècle' perversion of the late knockabout, promises to be popular and numerous."

The writer tenders his apologies to Mr. Stephens, and recognizes his "copyright." The "knockabout" has been for at least two years a racing boat, although retaining in all practical respects its safe, able and weatherly qualities. For the coming season the racing qualities are distinctly admitted by the Knockabout Association, while at the same time the cruising qualities have in no way been lessened. The class has been broadened by the addition of 100ft. of sail and permission to use spinakers, and at the same time centerboards have been admitted.

But at the same time the safe and cruising qualities of beam, draft and ballast have been retained. The new boats will be speedier and yet just as safe and desirable—even if not more so than the old ones. Yet as they will almost all carry short bowsprits they will depart from the strict "knockabout" and therefore deserve a new name.

"Raceabout" seems to fit, and the writer is not jealous because some one else suggested the name.

And if evidence is desired that the class will be a racing one there is no need to look further than the order just placed with Purdon by Charles F. Adams 2d for an up-to-date boat to conform to the class restrictions. Mr. Adams is one of the best known of racing yachtsmen in the East. He would not have a slow boat as a gift. He believes in racing as the best part of the sport of yachting, and would not have built a 500ft. of sail knockabout under any circumstances.

But with more sail, the carrying of a spinaker and the admission of the centerboards, coupled with the fact that some of the keenest racing men among the Eastern amateurs will be found in the class, Mr. Adams believes that it will furnish the sport he desires, and will therefore leave the "skimming dish" fleet for the semi-cruiser.

It will probably seem strange to him to change from the ticklish and must-be-carefully-handled Rooster to the non-capsizeable "raceabout" type; but if any one doubts his ability to sail one type as well as the other, they have only to refer to the Eastern knockabout race late in the season of 1896, in which he brought Vishnu home in second place, although never having been in the boat before.

His boat will be of just as small displacement and just as light as the restrictions will allow. She will be just over the minimum of 7ft. 9in. waterline beam and 3ft. draft, and will be 32ft. 3in. over all. She will be double planked. Lawley will build her, although he will not start work on her until the first of March.

Mr. Adams's entry in the class is sure to increase the interest in it, while he himself is assured of the best of sport.

No Time Allowance.

ASSOCIATION clubs which have declared for "no time allowance," either by vote in Association meetings or by special resolutions: Hull, Massachusetts, Boston, Burgess, Bunker Hill, Duxbury, Kingston, Plymouth, Mosquito Fleet, Winthrop.

Clubs which have disapproved the Association's action: Dorchester, South Boston.

Clubs which have made no opposition: Quincy, Savin Hill.

Clubs in the foregoing list which gave open races last season: Hull, Massachusetts, Boston, Burgess, Duxbury, Kingston, Plymouth, Mosquito Fleet, Winthrop, Quincy and Savin Hill, as well as South Boston and Dorchester.

Cohasset will vote "no time allowance" and probably give an open race the coming season.

Draw your own conclusions.—*Boston Globe.*

Narada, steam yacht, Henry Walters, after several delays, sailed from New York on Feb. 7 for Marseilles, with Capt. Dudley Brand in command. Mr. Walters will join her on the other side for a Mediterranean cruise.

The Inland Lake Yachting Association.

FOR the last half dozen years or more yacht racing has been firmly established on the numerous small inland lakes of the middle West, where it has grown rapidly. It has met with a generous support from citizens of the larger cities—Chicago, Milwaukee, Minneapolis and St. Paul—many of whom spend their summers, at least the week ends, at the lake resorts within a few hours of the cities by train. Though limited to small bodies of water and to craft of small size, the competition has become very keen, and the best of American and foreign designers have been called upon to provide the latest novelties in racing craft. Starting originally with the New York type of sandbag cat or jib-and-mainsail boat, the fastest of these about New York being purchased and shipped to the West, and then building new craft of the same type both at home and in the East, the Western yachtsmen have at last abandoned the old sandbag catboats and other square-ended craft in favor of the modern 15 and 20-footers, such as have been developed in this country through the Seawanhaka C. Y. C. international cup.

A large fleet of these small racers is now afloat on fresh water in Minnesota, Wisconsin and Illinois, and the number is rapidly increasing. The numerous clubs hold regular local races through the season and of late interclub racing has become very popular, the representative yachts of a club or clubs being transported by train or wagon to some one lake, where they can meet the pick of the local fleet.

Up to last season there was no attempt at unity or organization; each club had its own classes and its own special rules; so that interclub racing was often a matter of difficulty, and disputes were of frequent occurrence. The necessity for a union of all the clubs was plainly apparent, and the White Bear Y. C., of White Bear Lake, Minn., took the initiative last summer by issuing a call for a meeting of club representatives, which was held at White Bear Lake on Aug. 24. The following clubs were represented by the delegates named:

Nodoway Y. C., W. Z. Stewart and J. A. Kimberly, Jr.; Oshkosh Y. C., J. Frank Gates and Frank Libby; Detroit (Minn.) Y. C., W. L. Wilder; Duluth Y. C., W. C. Sargent; Pine Lake Y. C., H. Nunnemacher and H. Schidmore, Jr.; Green Lake Y. C., J. A. Kimberly, Jr.; White Bear Y. C., J. D. Elmer and J. W. Taylor; Oconomowoc Y. C., F. W. Peck per B. Carpenter, proxy; Lake Geneva Y. C., H. H. Porter and B. Carpenter; Delavan Lake Y. C., H. H. Porter and B. Carpenter.

At this meeting an association was formally organized and the following resolution was unanimously adopted: Be it

Resolved, That this association be known as the Inland Lake Yachting Association, and that the purpose of this organization is to encourage and promote yachting and interlake yacht racing upon the inland lakes of the West, under uniform rules of measurement, classification, racing and sailing.

Mr. C. M. Griggs, of St. Paul, was elected president, and Mr. B. Carpenter, of Chicago, secretary and treasurer, with the following executive committee: J. Frank Gates, Oshkosh Y. C.; J. D. Elmer, St. Paul Y. C., and the secretary-treasurer ex-officio.

Certain rules were adopted, and the secretary was instructed to forward copies of the rules, with invitations to join the Association, to other Western clubs. Later on the Lake Beulah Y. C., the Pistakee Lake Y. C., the Pewaukee Y. C. and the Indiana Y. C. joined the Association.

The first annual meeting of the Association was held on Jan. 28, at the Hotel Pfister, Milwaukee, the following clubs being represented:

White Bear Y. C.—C. A. Reid, F. M. Douglass and J. P. Elmer.
Green Lake Y. C.—Edward Rosing.
Pine Lake Y. C.—H. Nunnemacher, B. Schidmore, Jr., and F. Reitbrock.

Lake Geneva Y. C.—Benjamin Carpenter.
Fox Lake Y. C.—W. H. Lyford, Henry L. Hertz, B. B. Felix and C. M. Palmer.

Delavan Y. C.—F. D. Montgomery and J. E. Nyman.
Oshkosh Y. C.—L. Frank Gates and W. J. McCoy.
Nodoway Y. C.—J. A. Kimberly, Jr., and W. L. Davis.
Indiana Y. C.—Harry S. Hicks.

Lake Beulah Y. C.—E. F. Gillette and C. H. Welch.
Pistakee Lake Y. C.—Henry L. Hertz and A. C. Bower.

The following rules, based upon the general conditions governing the Seawanhaka C. Y. C. international cup, were adopted, to be unchanged for three years:

Article 1.—The start shall be a one-gun flying start, with preparatory signal.

Article 2.—The races shall be sailed without time allowance.

Article 3.—Two classes of yachts are provided for as follows: First class sloops must not exceed 20ft. racing length, the following formula determining the racing length: Add the load waterline to the square root of the sail area and divide by 2, which will equal the racing measurement. Second class sloops must not exceed 17ft. racing length.

Article 4.—A yacht's draft of hull or keel shall not exceed 5ft., and with the centerboard down shall not exceed 6ft. The draft shall be determined when yachts are in trim for measurement. Centerboards shall be so constructed that they can be wholly housed without leaving any projection below the keel or hull.

Article 5.—Yachts shall be measured without the crew on board, but instead thereof in the first class a dead weight of 450lbs. shall be carried amidships, approximately at the center of buoyancy, during measurement. The total actual weight of the crew, including all clothes, personal apparel, and belongings worn by them or carried on board during any race, shall not exceed 600lbs. In the second class the measurement shall be taken with a weight of 300lbs. on board, the sail shall be limited to 350sq.ft., and the crew to 450lbs.

Article 6.—Shifting ballast shall not be allowed. Weighted centerboards shall be considered fixed ballast.

Article 7.—No outrigger or other mechanical device for carrying live ballast outboard shall be allowed.

Article 8.—The factor of sail area, used in determining racing measurement, shall be ascertained by adding to the actual sail area of the mainsail, computed from its exact dimensions, the area of the fore triangle. The hoist of the mainsail, when measured, shall be plainly marked on the mast, and at its outer points on the boom, or gaff, or other spars used to set sail, and the sail shall not be set beyond these limiting points. The fore triangle shall be determined by the following factors: The perpendicular shall be the perpendicular distance between the deck and a point on the forestay, above which the jib shall not be hoisted. The base shall be the distance between the forward side of the mast at the deck and the point of intersection of the forestay with the bowsprit of the hull. Any jib when set must not extend beyond the upper and forward points above defined.

Sails shall be limited to mainsail, jibs, and spinnaker. The total area of the mainsail and fore triangle shall not exceed 500sq.ft. The area of the mainsail alone shall not exceed 80 per cent. of the total area. The area of the spinnaker, measured as a triangle whose base is the length of the spinnaker boom measured from its outer end when set to the center of the mast, and whose perpendicular is the distance from the deck at the fore side of the mast to the spinnaker halyard block, shall not exceed twice the area of the fore triangle.

Article 9.—The spinnaker boom, when used in carrying sail, shall not be lashed to the bowsprit or stemhead.

The officers for 1898, elected at the meeting, are: President, J. W. Taylor, St. Paul; Secretary and Treasurer, Benjamin Carpenter, Chicago; Executive Committee: the Secretary, ex-officio, B. B. Felix, of Chicago, and J. P. Elmer, of St. Paul.

The Association will hold a regatta on White Bear Lake in August.

North American Y. R. A.

MR. FRANK BOWNE JONES, secretary of the North American Yacht Racing Union, has sent the following notice to the members of the Council:

"Mr. Emilius Jarvis, one of the special committee appointed to confer with the British Yacht Racing Association, who is now returning from Europe, has cabled me requesting that a meeting of the Council be called for Saturday evening next, Feb. 12, to receive his report. Such meeting will be held at the Imperial Hotel, New York, at 8 o'clock on the evening named, and as many members of the Council as will find it convenient are requested to attend if possible.

"To those members of the Council not living in the vicinity of New York and who cannot attend the meeting a written copy of Mr. Jarvis's report will be sent. Yours truly,

NEW YORK, Feb. 7, 1898."

It is now stated that the real purchaser of the steam yacht Mayflower is Leopold, King of Belgium, and that she will be re-named Clementine. The yacht is now fitting for sea at the Erie Basin Dry Docks, and will sail in a short time for Southampton.

Yacht Measurement.

Editor Forest and Stream:

Your recent lament over the indifference of American yachtsmen to questions concerning the racing rules moves me to take up a few old ideas and string them together upon a thread of what your courtesy will permit me to call logic. But first I would acknowledge the great value of the altogether admirable report of the Seawanhaka racing committee, portions of which you published in your last issue. It will enable many of us to judge more intelligently in this matter, and should prove a sheet anchor to those who have already acquired the habit of "writing to the Times."

1. The aim of time allowance is to compensate for the natural difference in speed due to the difference in size. To determine the size it is necessary to measure something. If all yachts were similar in form the length of hull or any other dimensions would be sufficient for measurement. But yachts are not similar in form, and this brings in the problem.

I take it that the purpose of a measurement rule should be not to develop a particular type, but to give all types a fair opportunity. Failing in its complete fulfillment, the rule should avoid the encouragement of objectionable types.

2. Experience indicates that the direct measurement of linear dimensions leads to deformity of the yacht. Indirect measurements, such as areas and girths, give the designer greater freedom. In illustration of this consider the far-reaching effect of a tax on sail. Few dimensions escape the tax, yet their relative magnitude may be greatly varied to give the yacht its special fit-

compact form of midship section and a sail tax as by formula 2, is it desirable to tax the length? Conceive an extreme example of the fin keel type, the sail area being a fixed quantity. Let us reduce the breadth and shorten the fin, thus reducing the rating. Now, in order to carry the sail, we must add more ballast, thus increasing the displacement. Would there be any gain by increasing the length? I am disposed to think that an increase of length would be unwise on account of the increased wetted surface, unless the displacement were so far increased as to create serious wave-making resistance at ordinary speeds, in which case the length should properly be increased regardless of rules. The gist of it is that if the girth tax will produce a full compact form of midship section, then the sail tax will restrain the length within satisfactory bounds. In this connection it may be well to note the failure of the length tax to produce a sufficient area of midship section when co-ordinated with the sail tax. It is an evidence of the unsatisfactory operation of a dimension tax. The root of the difficulty seems to me to lie in the form of the midship section rather than in its area. With the present form of extremely undercut section more area would simply mean more breadth and greater draft, less speed and greater cost, unless other arbitrary restrictions were imposed, which in the end would surely prove irksome and detrimental to the sport.

In application formula 2 is very simple, and there are no square roots to be extracted. To prevent evasion by excessive flaring of top sides I would suggest that the girth be measured as in the figure. For convenience the tape measurement might be substituted for the true wetted perimeter and in the centerboard type the board

$$\text{Girth} = A + B$$

ness. In a lesser degree the girth of the midship section involves breadth, depth and area, yet the same freedom exists in their relative sizes. Indirect taxation would therefore seem preferable.

3. An opinion is widely held that the present rule leads to deficient displacement. A broader statement would be that the present rule leads to dispersion of the area of the midship section. Compactness of form is sacrificed, and with it seaworthiness and comfort. A more compact form would lead to greater displacement in order to retain the same sail-carrying power.

It would seem that compactness of form should be aimed at and displacement left free to be determined as a matter of special fitness, for there is ample room for many good boats between the splashier and the plunger, and even these should not have their opportunities confiscated, but simply taxed so that they may have no advantage over the more moderate forms.

4. It is a well-known truth that the sphere has less surface in proportion to its volume than any other form. It is plain, then, that taxation of the surface of the immersed body would tend to bring about a more compact distribution of the displacement, such surface being the sum of the wetted surface and the load water plane. If compactness in the form of cross-section alone should be sufficient, it would be necessary to tax only the girth of the midship section.

The sail tax not only commends itself as the most indirect and far-reaching, but has proved satisfactory, and by common consent should remain a prime factor in any rule. The logic of the situation seems, therefore, to indicate a formula somewhat like the following:

1. Rating = $\frac{\text{Sail area} \times \sqrt{\text{surface of immersed body}}}{\text{Constant}}$
2. Rating = $\frac{\text{Sail area} \times \text{girth of midship section}}{\text{Constant}}$

Considering these formulæ, it is probable that the first would produce a shorter boat than the second. On the other hand, the second would produce a fuller midship section. The surface of the immersed body is approximately the product of the mean girth by the length. In the first form, therefore, the tax is divided between the mean girth and the length, while in the second it is concentrated upon the extreme girth. Further, it is the extreme and not the mean girth which we aim to confine. I am disposed to believe, therefore, that the second form would produce a better midship section than the first. Now the question arises: Having a

housed, but these are details easily modified as experience may suggest.

5. It may not be inopportune to urge the substitution of seconds per hour instead of seconds per mile in the time allowance; to question the correctness of the common assumption that similar yachts of different size can sail at corresponding speeds—that is, at speeds proportional to the square root of their dimensions; and further to question the assumption involved in the present rule that the sail area is proportional to the square of the length.

But the instant need is a measurement rule; not a rule to exclude all but one arbitrarily fixed type, but rather one which will give fair play to every one.

JAMES N. WARRINGTON.

CHICAGO, Jan. 25.

NEW YORK, Feb. 2.—*Editor Forest and Stream:* The race committee of the Seawanhaka Corinthian Y. C. have given their report much study, evidently, and deserve all the commendation which you give them for it. It now remains to be seen whether they are willing, jointly or severally, formally or informally, to discuss some of the points in this report for the benefit of yachtsmen generally. It is therefore requested that they answer the following questions:

First.—Why is it not rational to classify racing yachts by the power that drives them?

Second.—How can seaworthiness or comfort be directly secured except by a requirement affecting cube of hull, or displacement?

Third.—If accommodation (or size) is required, why should not it be asked for directly?

Fourth.—Is it not a distinct advance in yacht designing to make 1lb. of wood do the work formerly done by 2lbs., providing no sacrifice of durability is entailed?

Fifth.—Is not the design of the framework of a yacht a problem in truss design, similar to the design of any other truss, but more complicated?

Sixth.—Is it not true that a wide, shallow yacht must be framed and trussed more than a narrow and deep one?

Seventh.—Is it not true that a light hull, properly braced, will outlast a heavier hull unbraced?

Eighth.—If two yachts have the same displacement and draft, how much, if any, difference will there be in the speed due to the fact that one hull is 3 per cent. lighter than the other?

Ninth.—Has any one ever calculated the ratio which

the weight of scantling bears to the total weight of hull; if so, what is that ratio?

Tenth.—Is it not impossible to fix in a scientific manner the sizes of scantlings, unless beam, depth, location and amount of ballast, position of sail, area of sail, freeboard, length of hull on waterline and length of hull over all, are all mentioned?

Eleventh.—Is not ability to carry sail a desirable characteristic?

Twelfth.—Are not these things true?

(a) Sail area is the only factor producing speed.

(b) Resistances are decreased by increasing the ratio of length to breadth, by increasing displacement, by decreasing wetted surface.

(c) Ability to carry sail is increased by separating the center of buoyancy as far as possible from the center of gravity.

Thirteenth.—If length on waterline is to be a factor, why should this length not be measured when the yacht is inclined to her usual sailing angle?

Fourteenth.—What fault can be found with a classification by sail area alone, each class to be restricted to a certain inclined water line length and displacement, the ballast to in no case exceed 45 per cent. of the displacement?

The above is written to produce discussion, and clearly outlines the writer's position. It is to be hoped that some of those who make the racing or measurement rules will answer the questions, so that some reasons may be had, standing as reasons only, that progress may be made. The writer's own experience has been that almost any one will talk about measurement rules; a few are willing to make them, but very few have the courage of their convictions and are willing to write about them, so that discussion may result and good may come of it.

C.

Through the Sound in an Oyster Sloop.

(Continued from page 116).

"We came from Napeague Bay to-day. I'm from New Haven. This young man belongs to Greenwich. Our sloop is anchored right off there." I pointed to where Susie lay.

"Well, I'm down here on a sort of a cruise myself. I'm with a party o' young men who don't know the first thing about sailin' a boat. We're from Hartford. I came with 'em on purpose to sail the boat. Here she is now, jest ahead o' Bernie's boat. Come aboard. Mebbe I can find a spare jig. If I can, ye can have it, and welcome. Ye see, we've been away three weeks now, and we're goin' to start home to-morrow, so we can spare a jig, I guess." He set the lantern on the edge of the wharf and slid down a pile to the deck of a small sloop. We handed down the lantern and followed.

"This boat belongs in Madison, and the boys hired her for the trip. They're a nice lot o' young fellers; there's five on 'em, and as I said afore, they don't know nothin' at all about a boat. It's quite a strain on a man to have to look out fer the tiller, the sails and a party o' five all to wunst. They try to help, but don't know how. One day we run into more wind 'n was good fer us. Well, we slacked down everything, and while I was reefin' the mainsail I told a couple on 'em to reef the jib. When everything was ready I ordered 'em to h'ist away, and what do ye think? Them fellers had tied all the reef-p'int's o' the jib slap-tight around the bowsprit. Say! now mebbe I didn't hev a devil of a time gittin' them reef-p'int's undone. They'd tied 'em in the worst snag o' granny knots I ever see."

All the while our new acquaintance was talking he was busily engaged overhauling fishing tackle; presently he said: "Well, here they be at last. So long's we're goin' home to-morrow, I guess we can spare a couple on 'em. How much do I want fer 'em, did ye ask? Why, bless yer souls, I don't intend to ask anything fer 'em. The boys are through with 'em, and I'm sure they wouldn't take a penny from ye. Well, if yer bound to pay, give me what ye've a mind to. Lord! don't ask me what they cost. Fifty cents apiece? No, sir. If yer bound to leave something, give me fifty cents fer the two, and take 'em along. The boys are all ashore, and I'm sure they wouldn't take a cent if they were here. Have a glass o' wine? It's good stuff, I tell ye. The boys wouldn't have anything aboard that wasn't good." I drank a glass with him, and found he hadn't misrepresented it in the least; it was fine old port.

Stanley is a teetotaler, so he refused the wine with thanks. "If it'll be no trouble to you, I'll take a drink of water instead," said he.

The old man stopped pouring his second glass, and gazed at Stanley in amazement. "Water! water!" he gasped. "Young feller, I'd like to accommodate ye, indeed I would. Ye could have it and welcome, but I don't believe there's eny of the stuff aboard. 'Pears to me like we did put some aboard one day, but, bless yer soul, I don't know what took it. We used it fer tea and coffee fer a spell, then the boys claimed it sp'iled the flavor o' the other stuff, and—yes, now I remember—they chucked it overboard. Ye see, water stands a poor show aboard o' this craft when there's near ten gallons o' the other stuff aboard. When we feel like washin' ourselves we goes in swimmin'."

We thanked the old fellow again, and took our departure. The last I heard him say, after we reached the top of the wharf, was: "Glad I could accommodate ye. I was with a party last summer, and they didn't have eny jigs. We offered as high as \$5 fer one, but none o' the blamed islanders would sell us one, even at that price. Don't forget to stretch eel skins over the shanks of the jigs. That's what makes the bluefish bite."

Silver streaks trailed astern of the skiff as we rowed to the sloop. I never saw so much phosphorus in the water as there was that night. Fish, swimming far below the surface, left ghostly trails, and the oar-blades stirred up countless glowing sparks. A log, rising and falling on the slight swell, resembled the ghostly outlines of a floating corpse, while now and then a straight, pallid line showed the course of an anchored boat's cable, far down, in the water.

After getting aboard and giving an account of ourselves, all hands turned to and fished for eels, but we caught none. Finally a couple of the fish caught that

day were skinned, and the skins were tightly sewed around the shanks of the jigs. The inside surface of the skins was left exposed. Sam thought bluefish would bite at this device as well as at an eel skin. This job finished, we sat on deck for awhile and watched some dazzling lightning flashing in the northwest. "I'm afraid the wind 'll be northeast to-morrow, and that 'll mean no fishing for us," said Sam, as we went below to turn in.

I was awakened near morning by a strange, mournful wail that broke on the air at regular intervals. I looked out of the companion way and could see nothing but our riding light. Not even the nearest yacht or smack was visible. The riding light seemed surrounded by a heavy veil and Susie seemed to be floating in an endless void of blackness. Once more came that mournful wail, and I crawled back into my bunk. A dense fog covered land and water, and the steam siren on the southeast end of the island was sending its ominous warning over the murky sea.

Morning broke thick with fog. What little wind there was came out of the northeast. Boats a short distance away could be but dimly seen. The siren continued its mournful wail, and every indication pointed to a most disagreeable day. So thick was the fog that none of the fishermen had dared to venture out. We had a good breakfast, after which there was nothing for us to do but to loll about on deck or sleep.

Sam and Stanley were below and I was sitting forward using the bitts for a writing desk while scribbling an outline of the cruise; Bub sat on the cabin roof, rod and reel in hand. He had been intently eyeing the point where his line entered the water for about an hour. When Bub's stock of questions would run short this was the way he would generally pass the time. That he surely expected something would happen some day if he only persisted in eyeing that particular point long enough was obvious to us all. At times his eyes would dilate, his fingers would twitch and his legs would contract ready to jump. We all hoped the expected climax would arrive during this trip—we little dreamed it was so near at hand. Suddenly there was the sound of a great commotion, and the heavy air was rent with whoops and yells. Fishermen aboard other boats afterward declared that from the sound of galloping and prancing up and down our deck they thought we must have a couple of cavalry horses aboard. "Whoopce! whoopce—who-o-o-p! Hi-yi-hi-yi! I've got him! I've got him," yelled Bub, spasmodically reeling in with all his strength, as he wildly pranced about. His line gyrate first this way, then that, and part of the line and the tip of his pole was under water, while again it would be above. "It's a whale—it's a whale! I'll bet a hun—" (he checked himself when he happened to think he had only a dollar in his pocket) "a dollar it's a whale!"

Sam and Stanley rushed on deck, and I got there in time to see something that resembled a dish pan turning somersaults roft. under water. With Sam's assistance the fish was soon flopping on deck. It wasn't exactly a whale, but it certainly was the largest fish we took on the trip. It proved to be a flounder, and weighed about 6lbs. Soon after Bub took another one a little smaller than the first one.

Near the middle of the morning Sam and Stanley took the skiff and started after crabs. Bub and I stayed aboard, and as the fog lifted so that the sun nearly shone soon after the steamer Montauk came in we tried a shot at her with the camera while she was unloading her passengers; we also snapped the steamer Block Island. Then we took a shot at a swordfishing schooner that was anchored near us. We little expected the plates would develop good pictures, and were agreeably surprised to have them turn out as well as they did. Soon after noon Sam and Stanley returned. They had over a bushel of fine crabs, which they caught in a pond on the eastern side of the steamboat wharf. They said that the bottom was literally alive with crabs.

It soon grew thick again, and the siren kept up its steady, mournful wail. We, however, didn't allow the fog to interfere with our appetites, and we had a fine dinner of steamed crabs. While we were eating, our colored neighbor with the crippled accordion regaled us with a beastly serenade. I wished him and his accordion at the bottom of the pond, but Stanley strenuously stuck up for him and swore that he was manufacturing elegant music. I'm not much of a judge of music, but I can tell when it is being murdered. I decided that Stanley would probably drop off into sweet and dreamless slumber while listening to a midnight caterwauling concert on the back yard fence. I was filled with a fiendish glee when the musical descendant of Ham saluted the darkly tanned Stanley with "Ah, there!" Then he commenced to yawp "All coons look alike to me." Stanley glared, but said nothing.

After dinner the fog was so thick that all idea of leaving our anchorage that day was abandoned. As the afternoon advanced it became very dark and looked as though it would surely rain. The rain held off, however, and about 2 o'clock Sam, Bub and I rowed ashore to view the island. We landed on the east side of the harbor, and walked across the narrow neck of land that separates Great Salt Pond from the bathing beach. So disagreeable was the weather that but few persons were in the water. We were surprised to find the surf so insignificant when compared to that of Napeague Beach. We noticed that all the cozy nooks under sheltering sand banks held gay summer girls and their escorts.

We stopped near the breakwater and examined some stanch double-enders. We were impressed by their grand seaworthy appearance. It is no wonder that these boats, with their great depth, good beam, sharp ends, simplicity of rig and water-tight decks, are worthy antagonists of any wind or sea. Their sea-going qualities have been fairly demonstrated for years, and their reputation for safety has been more than earned. We spent half an hour here, then we continued our ramble in the direction of Southeast Light.

It is quite a walk from the breakwater to the light, and the road twists and turns in all directions over the treeless hills. On clear days many fine views of the ocean can be enjoyed, but the fog was then so thick we could see but a little ways. Now and then the fog would lift a little and disclose the sea dotted with the sails of

pleasure craft. Block Island skippers appear able to drum up excursion parties under any and all conditions of weather.

As we approached nearer and nearer toward the light the siren wailed louder and louder. It seemed fairly to lift and split the heavy atmosphere, and must have been heard many miles away over the fog-hidden sea.

It was very late in the afternoon when we finally reached our destination, and, as we entertained doubts as to whether we would be allowed on the premises we decided to continue on a ways beyond the lighthouse before approaching the cliffs. Of course we didn't wish to go unrewarded after our long walk, therefore when we had walked to what we considered a safe distance we crawled between the strands of a barb-wire fence and entered a lot on the edge of the cliffs. These cliffs were what we wished principally to see, and we knew that by working the matter in the way we did nobody could drive us away until we had obtained our view.

We followed a faint path across the lot for a distance of 200yds. or so, then without warning we reached the edge of the cliffs. Never will I forget their appearance, nor the view from their summits that afternoon.

When the heavens are cloudless and the sun shines brightly the view from where we stood must be grandly, gloriously beautiful. Now, however, the sight we looked upon was one of deep and hopeless gloom. Sea and sky were hidden by a dreary, restless curtain of dark gray mist. Far down below us surges of inky blackness ceaselessly rolled from under the curtain's foot and beat themselves in fury on the black-rocked shore. Sharp dark gray pinnacles and jagged, saw-toothed edges pierced the gloomy curtain, showing where the ragged cliffs were hidden by the mist. Tremendous hollows, scooped out by the elements here and there, had undermined the edges of the cliffs and threatened to hurl them into the sea of destruction gnashing its fangs at their feet. Seared and wrinkled by ten thousand storms, these cliffs frown hopelessly on the heartless surges that are slowly but surely eating them away. In full keeping with the dreary scene the skeleton form of a wrecked tower reared its black outlines from near the foot of the cliff on which we were standing.

Now and then the fog would lift and reveal ebony patches of sea. At such times a small sailboat could be seen rising and falling on the gloomy surges. The fierce roar of the surf on the rocks seemed the pitiless laugh of a supernatural demon, gloating in devilish mockery over the helpless condition of condemned souls drifting to sure destruction in that frail craft. The mournful wail of the siren seemed the sob of an imprisoned god-dess, who, through pity for their helplessness, would warn the souls of the fate that awaited them, though sadly realizing her warning to be in vain. Were I an artist I would strive to paint that picture, and if success crowned my efforts I would name it "Despair."

We spent over half an hour on the edge of the cliffs, then as no one appeared to notice us we ventured into the inclosure where the lighthouse stood. We watched the machinery that worked the siren for a while, then retraced our steps to the skiff, which we reached after dark. When we reached Susie's side we were surprised to see a large Government vessel anchored just astern. She had come in while we were away.

A faint and almost indistinct crescent moon floated in the misty heavens when we turned out next morning. The siren was still sounding its mournful warning. In spite of all such unfavorable conditions, however, the clanking of windlasses, clatter of chain cables and rattle of halyard blocks told of many boats getting under way for the fishing grounds. Now and then the sails of one would loom through the fog, and she would sweep by us like a white-winged phantom. We ate breakfast, got our anchor, and started out with the intention of fishing on Southwest Ledge.

While many boats had started ahead of Susie, yet in the light air that was blowing we overhauled them one by one, and when we passed the end of the breakwater we were leading the fleet. Once outside the pond we found the wind much lighter than when we started, and dead ahead. The fog too was thicker, and as the other boats made the end of the breakwater they headed off on a northerly course instead of the direction of Southwest Ledge. "The weather is so thick that they intend to keep in sight of land," said Sam. "They're going to fish off Sandy Point. Shall we keep them company?"

We argued the question a while and decided to keep our course. "If it should clear any I'm in favor of visiting the ledge. If it still remains thick, though, we'd better keep going for the Race," advised Sam. We all agreed to this, and as matters hadn't improved in the least when we reached Dicken's Point our fishing trip to the ledge was regretfully abandoned.

Now that we were fairly homeward bound the island was soon lost in the fog and we could see no land whatever. Then the wind gradually petered out, and we lay listlessly rolling on the leaden swells. To make matters still more disagreeable and uncomfortable it commenced to drizzle. Sam had contracted a bad cold and there were ominous indications that Bub would soon be in the throes of malaria, so he and Sam went below and turned in. Stanley and I donned oilers and took up our watch on deck.

About eight bells a slight air commenced gently to blow from the west, and under its influence we were soon moving on our way again. The fog lifted somewhat, but the heavens grew darker, and the muffled sound of thunder could be heard in the direction of Montauk Point. The sullen sound broke out again, and the swells grew heavier and heavier. I drew the conclusion that we were in for a nasty time. I am not the one to boast that I was thrilled with enjoyment at the prospect; there had been two occasions on the trip when it was nasty enough to suit me. Sunshine would have been a godsend about then. Much to our satisfaction the thunderstorm passed out to sea.

About four bells Bub crawled out of the cabin on all fours. He crept over to the rail, where he held close communion with Neptune for three or four minutes; he then crawled meekly below again, forgetting to mention anything about "malaria" on his way.

I thought I detected a deep feeling of sympathy in Stanley for Bub. He turned ghastly whenever Bub's

trouble was mentioned, and his Adam's apple worked up and down in his throat like the suction valve of an iron pump. He appeared on the point of weeping, and I wondered why I hadn't discovered the tenderness of his heart before. When I caught him casting thoughtful, longing eyes over the rail, however, I more than half suspected that what I had taken for tender-heartedness might be an approaching attack of "malaria" instead.

After awhile the wind hauled to northwest. The clouds drifted apart and the sun shone forth in a flood of warm, mellow light. Close hauled, we were pitching over the long ocean swells with lee rail pressed to within in. of the surface. Sam came on deck, stretched himself, yawned, looked around and exclaimed: "Hello! how is this? Why, that's the schooner Pearl, and she's two miles ahead of us, and a mile to windward! We beat her fully half a mile coming out of the pond!"

"By George! I'll bet she stood clean across to the mainland, out of the tide; caught the first of this wind, and went ahead while we were rolling on these swells against the tide," said Stanley, laying down the glasses through which he had been looking while Sam was talking.

"That's just what she did do, and if we'd only done the same we'd be just as far ahead of her as she is ahead of us."

"Well, don't you care. If she only goes our way, we'll have a race. We'll see how long it'll take to overhaul her. If we both go through Fisher's Island Sound, and this wind holds, I'll bet we'll have her astern before we reach Stonington."

Possibly Stanley's prophecy might have been fulfilled had the wind held as favorably for us as it did for Pearl, but it gradually grew fainter and fainter in our neighborhood, and finally died away altogether. It was extremely exasperating to see vessels speeding on their way under the shore with more wind than they needed, and not even to have a catspaw ourselves. Now that it had left us entirely, there was nothing for us to do but lie lazily around, view the waves and sky and whistle enticingly. There was some consolation in the fact that we had dropped Block Island so that it seemed a dim bank of haze far over our stern.

Montauk, however, it seemed we never would drop. Far off toward the Race an extremely unusual sight for these days met our view. There, towering majestically skyward from the midst of a fleet of shimmering sails, the snowy wings of a full-rigged ship lifted gracefully into the azure air. To the north of her the low sandy shores of Fisher's Island burned like a setting of gold for an emerald gem. Around and about us on every hand the indigo swells seemed sprinkled with tinsel spangles from the sparkle and flash of thousands of lobster buoys which lifted and fell in the rays of the sun. Dories too dotted the surface, as also did the schooners to which they belonged.

Just before noon our drooping hopes were raised by the appearance of a long streak of wind reaching out in our direction. When we finally got it we had all that we could conveniently swing to under mainsail, topsail and jib. It was from northwest, and by the vicious manner in which it came down upon us we concluded we had whistled up all we would need. The crests of the sweeping swells were soon lined with foam, and Susie butted into them with the force of a battering-ram. The spray flew, the wind whistled through the rigging and Susie went hunting for the schooner Pearl, which had disappeared from view.

At two bells we passed between the four spindles that mark rocks and shoals at the entrance of Fisher's Island Sound. We felt the full force of the tide, which was in our favor, and the manner in which it "horsed" us down toward Latimer Reef Light against the wind filled us with delight. We were half way between Watch Hill Reef and Latimer Reef Light when one of the 36ft. racers rounded Watch Hill Point. "We'll see how long it'll take her to overhaul us," said Sam.

"She can't do it for a dollar," replied Stanley. His bet was not taken.

When off Stonington we took a couple of knock-downs which caused us to clew up the topsail. Spiteful and puffy, down from the green hills of the Connecticut shore line came the wind. In Susie, however, they found an antagonist fully able to cope with their strength; besides a master-hand was at the tiller, for Sam was steering at the time. Puff after puff sped in wrinkled catspaws over the indigo surface, and Susie careened at times until the spume laved the side of the cabin house to leeward. Her bows smashed the advancing waves into showers of spray, which unmercifully doused us as it flew aboard in sheets. We passed Latimer Reef Light like a steamboat, and were much gratified to notice that our antagonist astern had not gained on us an inch. In fact, she had apparently lost ground.

Gradually the wind hauled more to the north and we could head our course. When we were almost even with Ram Island Lightship it dropped in strength a trifle, and our antagonist, who still held a strong wind, hauled up on us rapidly. Soon we had it as hard as ever again, and slowly but surely we regained what we had lost. Bub took a shot at the lightship with the camera.

When we reached the mouth of New London Harbor Susie was more than a mile ahead of her rival and gaining all the while. To be just to the yacht it must be admitted she towed her tender. Still Susie proved herself wonderfully fast for a working boat. The yacht entered New London Harbor just as we sighted the schooner Pearl about two miles ahead.

W. H. AVIS.

[TO BE CONCLUDED.]

YACHTING NEWS NOTES.

The annual report of the Royal St. Lawrence Y. C. for the past year shows that the club consists of 470 members, of whom 386 are senior resident, 48 senior non-resident and 15 junior members. During the year 90 new members were elected, of whom 77 are senior resident, 8 senior non-resident and 5 junior. Seven senior resident members acquired life membership. There were 30 resignations and 13 names were dropped from the list of members. The report says: "The races for the Seawanhaka international challenge cup during the past season aroused a great deal of interest, and brought the club into greater prominence. We may congratulate ourselves on the success of our Commodore's boat, Glencairn II., and express the hope that our members will take a greater interest during the coming season in the defense of the cup." The new club house was completed barely in time for the Seawanhaka challenge cup races in August, and too late in the season to be fully availed of by the members. The total cost of the house was \$6,152.20, and of new furniture \$963.99, in all \$7,116.19. The balance sheet shows that during the year the revenue was \$1,527 in excess of the expenditure, a state of affairs which is certainly conclusive as far as the prosperity of the club is concerned. This, however, is put in the shade by the statement that the surplus of the assets over the liabilities amounts to \$10,505.22.

The Bunker Hill Y. C., of Boston, held its annual meeting on Jan. 26, the following resolution being adopted: "Whereas, this club being a member of the Yacht Racing Association of Massachusetts, which was organized in 1896 for the promotion of yacht building and yacht racing, and whereas, the Association having voted in 1896 to abolish 'time allowance' after the season of 1897, and having recently given two fair and impartial hearings on the subject, and having finally voted to sustain former action, therefore be it Resolved, that this club favors 'no time allowance' as being in line of progress, and that the extension of the class limits is desirable for many reasons; that we heartily approve the Association's success, and indorse its efforts to encourage yacht racing."

Messrs. Murray & Tregurtha, of South Boston, are busy with the large line of power yacht and launch work of which they make a specialty. In addition to steam and naphtha yachts and launches from 60ft. downward, fitted complete for use, they build hulls without power, simply fitted with beds for engines and boilers. They also build gasoline engines, several types of simple and compound marine steam engines in a number of sizes, and the Tregurtha safety watertube boiler.

The Stamford Y. C. held its annual meeting at the Suburban Club in that city on Feb. 1. In the absence of the commodore and vice-commodore, Rear-Commodore Walton Ferguson presided. The reports of the officers and committees showed the club to be in prosperous condition, with a membership of 100, and a fleet of twenty-five yachts. The following officers were elected: Com., H. C. Smith, steamer Halcyon; Vice-Com., F. M. Hoyt, cutter Syce; Rear-Com., Walton Ferguson, steam yacht Avia; Treas., Charles H. Leeds; Sec'y, A. Leland Brown; Fleet Surgeon, Dr. Samuel Pierson; Meas., Dr. I. Franklin Wardwell; Chaplain, Rev. Dr. R. P. Vail. Directors: H. K. McIlarg, Schuyler Merrill, A. C. Hall, E. C. Hoyt, M. R. Pitt, James D. Smith, E. E. Bruggenhot, Stewart W. Smith, Alfred F. Pitt, F. W. Lockwood. Nominating Committee, 1898-99: A. H. Smith, H. P. Bartlett, W. M. Smith, G. H. Hoyt, W. D. Daskam.

Glencairn I., the winning 15-footer of 1896, has been sold by Com. James Ross to George Brunder, of Milwaukee, who will race her on Pine Lake.

At City Island Mr. Wood has in hand a racing 42-footer from designs by Gardner & Cox, for John D. Parker, of Cambridge, Mass. The model is very similar to the successful Norota, built by Mr. Wood from Gardner & Cox's designs in 1895, with some modifications suggested by Syce. She will be 46ft. over all, 30ft. l.w.l., 9ft. 6in. beam, 7ft. 5in. draft, with about three tons of lead on her modern fin. A low cabin house 12ft. long gives a very good cabin, with berths for four, while there is room for two in the forecabin. She will be fitted for cruising, with galley, ice box, etc.

The development in yacht modeling in the last twenty years is shown in the old Clara and the young Norota, which are hauled up side by side. Clara, with Minerva and Madge, introduced the English keel and led Burgess to build the historic Gossoon. The little Norota now represents the last development of the type which became a favorite. Clara, standing high, presents a great green copper wall of keel, with the stem dropping straight down to a forefoot perhaps 8 or 10ft. below the waterline, and looking somewhat like a big oyster resting on edge and partly flattened on its upper ridge. Norota has no forefoot of any kind, and the line of her stem is trained away in and down until it almost meets the foot of her raking sternpost. She is pretty nearly all bow to the foot of her rudder. Could there be any greater extremes than these boats represented? Here is the first and last word about the keel in America. And while the many other craft resting in the neighborhood explain the intermediate developments these two, Clara and Norota, tell what the ingenuity of Americans did with the keel in a few short years. They took it as Clara and Minerva brought it, clumsy and inactive, though seaworthy, and they have developed a craft that is really an aquatic gymnast. It was a good thing, the keel, and it was pushed along until its changes would have entirely obscured its origin if it were not for Clara and some other old-timers which still stand by, apparently as good as new, to tell of the earlier days.—*Stinson Jarvis, in the Tribune.*

The annual meeting of the Riverside Y. C. was held on Feb. 4 at the Arena, New York, with Com. Tyson in the chair. The following officers were elected: Com., George G. Tyson, schr Nirvana; Vice-Com., W. A. Hamilton, auxiliary Alcedo; Rear-Com., Charles T. Pierce, cat Oconee; Treas., J. E. Peck; Sec'y, John G. Porter; Meas., T. E. Ferris; Trustees for term ending February, 1901, Charles T. Pierce and Edwin Binney; Regatta Committee: C. T. Pierce, Frank B. Jones and George B. Clark; Membership Committee: Charles F. Buxton, Robert Rutter and William Holzderber; Entertainment Committee: J. Arthur Oatwell, J. Cabot Varian and W. J. L. Davids; Chaplains, the Rev. F. R. Sanford, the Rev. George C. Houghton and the Rev. Rufus S. Putney; Fleet Surgeon, Dr. H. H. Tyson, Jr.

On Jan. 26 the annual meeting of the Gravesend Bay Y. C. was held at the club house, Twentieth and Cropsie avenues, Bensonhurst. There are now over 300 members of the club, with sixty yachts. The following officers were elected: Com., Charles W. Morgan; Vice-Com., Edward P. Morse; Rear-Com., Eugene V. Rosemond; Meas., Richard W. Rummell; Pres., Cornelius Furgueson; Vice-Pres., Thomas Cleary; Treas., Henry W. Pfalzgraf; Financial Sec'y, Charles W. Kennedy; Recording Sec'y, James W. Wakelee; Trustees: John E. De Mund, M.D., Thomas J. Hamilton, Walter J. Byrne, Jr. Hudson Riley, John T. Woods, Edward D. Weldon, Frank C. Mason, G. Ed Graff, W. J. Coyle, N. N. Morrissey, Frank A. Bolles and Thomas D. Nevins.

It is now practically settled that there will be no consolidation of the local yacht clubs this season. The hardy annual story is recalled each year, and a very small minority seem to think a chance exists for the consummation of the plan which has been hanging fire for several years. It was said this year that the issue would enter into the election of the Columbia Y. C., which will take place March 5. Reasons exist why the members of the Columbia Y. C. do not care for a consolidation with the Chicago and Lincoln Park clubs. Those reasons are both sentimental and material. In the first place, many members have been in the club since its organization, and would be loath to give up the name they have worked to make respected among yachtsmen. The material reason is one of finances. In the Columbia Y. C. are many young men and men of moderate means who care for the sport, but who cannot spend the money which is generally supposed to be necessary. They own small boats, compete in the regattas, and have all the sport, but at the same time endeavor to keep their expenses within their means. That class objects to affiliation with men who own the large boats and can spend any amount of money. There is a disposition to protect the smaller owners, which is highly commendable. The Columbia Y. C., however, can by no means be called a poor club. All the wealthy owners are also members of it, but the dues are reasonable. It has a membership of 123, just at the end of the year before the new members are enrolled for the active season. The movement for a club house is progressing. It is intended \$10,000 shall be expended.—*Chicago Times-Herald.*

The Philadelphia Y. C. held its annual meeting on Feb. 2, electing the following officers: Com., Josiah R. Adams; Vice-Com., James G. Ramsdell; Rear-Com., William F. Davies; Fleet Surgeon, W. Joseph Hearn, M.D.; Harbor Master, Charles S. Warfield; Trustees, Robert P. Thompson, J. Lewis Good, S. W. Bookhammer, Samuel F. Givin; Sec'y, Abraham L. English; Meas., Philip H. Johnson; Race Committee: Robert C. Clarkson, John S. Mickle, John S. Pomeroy. Com. Adams has appointed Thomas Petersen as Fleet Captain.

Nahma, steam yacht, Robert Goclet, after reaching Bermuda on Jan. 25, sailed on Feb. 2 for St. Thomas.

The Inwood Y. C., of Inwood-on-the-Hudson, held a meeting on Feb. 1 and elected the following officers: Com., William H. Flitner; Vice-Com., Edward G. Rowland; Fleet Captain, Washington B. Reed; Recording Sec'y, Michael J. Clancy; Financial Sec'y, Robert Drennan; Treas., Edwin D. Belknap; Fleet Surgeon, Daniel B. Spence; Meas., Edgar L. Van Alst; Steward, William Reed; Directors: Andrew G. Van Alst, David R. Thom, Jr., Samuel J. Cooper, Joseph B. Malloy, Anton Feldkamp, Robert Drennan, Edwin D. Belknap, William A. McQuade, Richard W. Berrian, Walter G. Flitner, Daniel B. Spence and Washington B. Reed.

Mr. Linton Hope, managing director of the Thames Yacht Building Co., has resigned that office and will abandon building entirely, confining himself to designing.

Rifle Range and Gallery.

Rifle and Revolver Competitions,

To take place during the Sportsman's show, Mechanics Building, Boston, March 14 to 26, 1898, under the direction of committee as follows:

Rifle.—F. B. Crowninshield, chairman; C. W. Hinman, John T. Humphrey, Charles H. Eastman, J. E. Kelley.

Revolver.—F. B. Crowninshield, chairman; John B. Paine, Louis Bell, E. E. Partridge, Butler Ames.

Match A.—Any revolver championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open to any revolver of not over .45cal., with barrel not over 7½in. in length, exclusive of cylinder. Sights must be strictly open and not over 9in. apart. Trigger-pull shall not be less than 3lbs. Position, standing without rest or support, shooting arm extended, elbow free from the body. Targets will be the standard American reduced to 20yds. Number of shots: This match calls for 50 consecutive shots, which must be finished within 25 minutes of the first shot. Cleaning allowed between scores. Ammunition: Any ammunition of not over 12grs. black powder, or its equivalent in smokeless, allowed. Entrance fee for this match is \$5. Distance 20 measured yards. Entries: Only one allowed by the same individual. Ties will be shot off.

Match B.—Military revolver championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open only to the present standard .38cal. revolver as issued by the United States Government to the troops. Sights must be the regular open and fixed military sights with which the revolver is issued. Trigger pull shall not be less than 4lbs. Position, standing without rest or support, shooting arm extended, elbow free from the body. Targets will be the standard American reduced to 20yds., with Creedmoor count. Number of shots: This match calls for 50 consecutive shots, which must be finished within 25 minutes from the first shot. Cleaning allowed between scores. Ammunition must be the regular full charge service cartridge intended for this arm. Entrance fee for this match is \$5. Distance 20 measured yards. Entries: Only one allowed by the same individual. Ties will be shot off.

Match C.—Pistol championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open to all pistols of .22cal., with barrels not over 10in. in length. Sights must be strictly open and not over 10in. apart. Trigger pull shall not be less than 2lbs. Position, standing without rest or support, shooting arm extended, elbow free from the body. Targets will be the standard American reduced to 20yds. Number of shots: This match calls for 50 consecutive shots, which must be finished within 50 minutes from the first shot. Cleaning allowed between scores. Ammunition: Any .22cal. rim-fire ammunition allowed. Entrance fee for this match is \$5. Distance 20 measured yards. Entries: Only one allowed by the same individual. Ties will be shot off.

Match D.—Rifle championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open to all rifles of .22cal. Sights: Any sights except telescope sights allowed. Position: The position will be off-hand. Targets: The 25-ring target will be used for this match. Number of shots: This match calls for 50 shots, which must be shot in ten rings of 5 shots each at any time during the tournament. Each string must be finished within 10 minutes from the first shot. Cleaning allowed between strings. Ammunition: Any .22cal. rim-fire cartridges allowed. Entrance for this match is \$5. Distance 100 measured feet. Entries: Only one allowed by the same individual. Ties will be shot off.

Match E.—Any revolver re-entry. Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, position, targets, cleaning, ammunition and distance are the same as in the any revolver championship match. Scores: A score to consist of 6 consecutive shots, which must be finished within 3 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

Match F.—Military revolver re-entry: Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, trigger-pull, position, targets, cleaning, ammunition and distance are the same as in the military revolver championship match. Scores: A score to consist of 6 consecutive shots, which must be finished within 1 minute from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

Match G.—Pistol re-entry: Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, trigger pull, position, targets, cleaning, ammunition and distance are the same as in the pistol championship match. Scores: A score to consist of 6 consecutive shots, which must be finished within 3 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

Match H.—German ring, re-entry rifle: Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, position, targets, cleaning, ammunition and distance are the same as in the rifle championship. Scores: A score to consist of 3 shots, which must be finished within 5 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

Match I.—Standard American re-entry rifle: Prizes: There will be twelve prizes, dividing \$100, as follows: \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, position, cleaning, ammunition and distance are the same as in the rifle championship. Targets: The standard American target reduced to 100ft. with 7-ring black will be used in this match. Scores: A score to consist of 5 shots, which must be finished within 5 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

General Conditions of all Matches.

1. Arms: Only pistols and revolvers which are regularly for sale and which can be bought in the open market on the date of this circular (Jan. 10, 1898) allowed. This rule does not apply to slight changes from the regular factory handles in any revolver and pistol matches.

Rifles of the latest patterns will be kept at the range for the free use of all competitors desiring to use them.

2. Entrance fees: The entrance fees for all championship matches will be \$5 for one match and \$3 additional for every other championship match.

Competitors in all championship matches will be given a pass admitting them to the range at all times during the exhibition.

3. All matches, both championship and re-entry, are open to all.

4. Injury to weapons: In case a weapon should become disabled during the firing of a score, the shooter should immediately notify the officer in charge, who may (at his discretion) give permission to discontinue the score until the necessary repairs are made, the contestant in the meantime being debarred from further shooting on the range; or he may allow a new weapon to be substituted.

5. Loading: In all revolver matches the chambers shall be

The Royal Canadian Y. C. has announced the following fixtures for the season of 1898: Saturday, May 28, 27ft., 22ft. and skiff classes. Saturday, June 11, first class and 22ft. (knockabout) classes. Saturday, June 25, 27ft., 22ft. and skiff classes. Friday, July 1, Race for Queen's cup, yachts 32ft. C.L. and under. Saturday, July 9, first class and 22ft. (knockabout) classes. Saturday, July 23, 27ft., 22ft. and skiff classes. Saturday, Aug. 6, first class and 22ft. (knockabout) class. Saturday, Aug. 20, 27ft., 22ft. and skiff classes. Monday, Sept. 5, Labor Day, Prince of Wales cup race, for all classes of yachts. Saturday, Sept. 10, skiff class. In races for the 22ft. knockabout class it is imperative that two new boats be entered, and that the same shall have been constructed since Dec. 4, 1897, and in accordance with the limitations of the L. Y. R. A. for this class. The club cups for the several classes will be awarded as in the season of 1897.

fully loaded for each score (or enough chambers to complete a score) and they must be discharged consecutively.

6. Dates of matches: All matches will be open on Monday, March 14, and will close at 6 P. M., Saturday, March 26.

7. Hours: The range will be open daily at 10:30 A. M., and will be closed at 10:30 P. M.

8. Targets: Competitors will be assigned targets in the order in which their score tickets are received, and no one may occupy a target for a longer time than is allowed for the completion of two scores, when others are waiting to shoot, except in championship matches.

9. Use of targets: Contestants may shoot their championship matches at any time during the two weeks the range is open by first notifying the officer in charge.

10. Penalties: No weapon shall be loaded except at the firing point, and any one found violating this rule—or acting in a way prejudicial to the safety of others—shall be warned by the officer in charge, who may (at his discretion) prohibit the offender from further shooting on the range, in which case he will be considered to have forfeited his entrance money.

11. Ties: In all championship matches any ties which may occur will be shot off Saturday, March 26, between 6 and 10:30 P. M.

12. Change of targets: In the any revolver championship match targets will be changed every six shots.

In the military revolver championship match targets will be changed every six shots.

In .22cal. pistol championship match targets will be changed every ten shots.

In the rifle championship match targets will be changed every five shots.

13. Range committee: The gallery will be in charge of the range committee, who will decide any questions which may arise and interpret all rules. Their decision will be final.

14. Scoring: A shot must clearly cut the line to count.

15. Scorers: The non-shooting members of the range committee will count the scores as fast as they are returned from the pits.

Prizes: In addition to the prizes offered in the above-mentioned matches, special cups and merchandise prizes, which will be announced later, will be added.

Entries, including entrance fee, may be mailed to F. B. Crowninshield, Pierce Building, Copley square, Boston, or will be received at the range at any time during the tournament.

Rifle Notes.

A GREAT many riflemen know John R. Hegeman, Jr. Mr. Hegeman is a firm believer in small calibers, and has experimented to a great extent with the .30cal., particularly on deer. His latest exploit, however, was on cattle with a .236. These are his words: "Not long ago I had an opportunity of shooting a wild steer (bull), and shot him about 60ft. from the muzzle of the gun with a .236, using the soft-nosed bullet, striking him at a point making a triangle with the eyes. Thus the bullet struck him just about $\frac{1}{2}$ in. below the top of the head. It smashed the skull into about thirty or thirty-two pieces, and drove parts of the bone into the neck and the forward shoulder of the near side." It is needless to say that Mr. Hegeman's belief in small calibers is stronger than ever.

We understand that a match has been arranged between Ignatz Martin, of the Williamsburg Shooting Society, and C. S. Dietrich, of Munich, Germany, the conditions being 100 shots per man, strictly off-hand, \$50 a side. The match is to come off on July 12, immediately after the close of the National Bundes shoot at Glendale Park, L. I. Mr. Dietrich showed up well in the recent tournament at Madison Square Garden, his style of off-hand shooting being much admired.

The daily press gave a great deal of space to the competitions held in Madison Square Garden during the Sportsmen's Exposition. The attention given by the press to these contests was largely due to the excellent manner in which the reports were handed into the press room by W. von Wussow, the assistant official scorer during the tournament. FOREST AND STREAM also owes Mr. Von Wussow a vote of thanks for many of the scores and details given in its report of the tournament.

L. P. Ittel, of the Pittsburg Rifle Club, went out to the club's range at Wilkinsburg, Pa., Friday, Jan. 28, and made a record of 95 at the 200yds. range, averaging 89 $\frac{1}{4}$ for four strings. Taylor was second best with 86 $\frac{1}{2}$.

Pittsburg Rifle Club.

PITTSBURG, Pa., Jan. 28.—The Pittsburg Rifle Club members went out to the Wilkinsburg range to-day, some fine shooting being done at the 200yds. range. J. P. Ittel made the splendid total of 95, and averaged 89 $\frac{1}{4}$ for four strings. Scores were:

Ittel95	89	87	86—89 $\frac{1}{4}$	Davis81	78	77	76—78
Taylor89	86	84	85—86 $\frac{1}{2}$	Bell79	73	77	70—75
Sorg84	81	80	79—81					

Feb. 1.—At to-day's practice shoot on the indoor range of the Pittsburg Rifle target, 25yds., Universal target, the following scores were made:

Ittel74	71	70	70—71 $\frac{3}{4}$	Hubbard63	65	58	57—60 $\frac{3}{4}$
Hoffman71	65	68	65—67 $\frac{1}{4}$	Shore56	55	56	68—58 $\frac{3}{4}$
Ewing70	69	64	64—66 $\frac{1}{2}$	Miller58	58	59	56—57 $\frac{3}{4}$
Bradshaw70	64	61	60—63 $\frac{1}{4}$	Schmidt61	58	55	51—57

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Feb. 10-11.—Indianapolis, Ind.—Tournament of the Limited Gun Club. First day, sparrows; second day, handicap race at targets; handicaps 100 to 110; \$10 entrance, targets extra.

Feb. 12.—Hackensack, N. J.—50-target race for silver cup; unknown angles; open to all; no handicap. C. O. Gardner, Sec'y.

Feb. 12.—South River, N. J.—Tournament of the South River Gun Club; live birds. H. H. Stevens, Manager.

Feb. 15-19.—Hot Springs, Ark.—Second annual midwinter tournament. First four days, targets; last day, live birds. \$1,100 added money. Programmes ready Jan. 15. Send your address for one to Jno. J. Sumpter, Jr., Box 111, Hot Springs, Ark.

Feb. 17.—Lyndhurst, N. J.—Open sweepstake at live birds on the grounds of the Lyndhurst Shooting Association; 25 birds, \$10 entrance, birds extra. Take Erie to Rutherford, or the D., L. & W. to Lyndhurst. T. W. Morley, Sec'y.

Feb. 18-20.—Davenport, Ia.—Merchandise tournament of the West End Gun Club. L. Haneman, Sec'y.

Feb. 20-22.—Tucson, Ariz.—Fifth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Blue Rock Gun Club, of Tucson.

Feb. 22.—Atchison, Kan.—Tournament of the Atchison Gun Club. Live birds and targets.

Feb. 22.—Buffalo, N. Y.—Invitation target shoot of the Bison Gun Club.

Feb. 22.—Sistersville, W. Va.—Tournament of the Sistersville Rod and Gun Club.

Feb. 22.—Pawling, N. Y.—Tournament of the Pawling Gun Club.

Feb. 22.—New Haven, Conn.—Tournament of the New Haven Gun Club; targets. W. H. Hazel, Sec'y.

Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club at North Pond Shooting Park; targets. V. D. Kenerson, Sec'y.

Feb. 22.—Bound Brook, N. J.—Opening shoot of the Bound Brook Gun Club. Live birds.

Feb. 22-23.—Lexington, Ky.—Tournament of the Lexington Gun Club; targets, crows and pigeons. V. K. Dodge, Sec'y.

Feb. 22-23.—Buffalo, N. Y.—Second annual midwinter tournament at Audubon Park, under the management of E. W. Garbe. Targets, \$50 added.

Feb. 22-23.—Henry, Ill.—Tournament of the Henry Live Bird Club at the Big Four Driving Park. Targets and live birds.

March 8-10.—St. Thomas, Ont.—Tournament of the St. Thomas Gun Club. Targets and live birds. Added money, and an international live-bird trophy. Under the management of Jack Parker.

March 15-18.—Utica, N. Y.—Tournament of the Oneida County Sportsmen's Association. Live birds and targets. Open to all. Henry L. Gates, Pres.

March 22-24.—Elkwood Park, Long Branch, N. J.—Interstate Association's sixth annual Grand American Handicap. 25 birds, \$25, birds extra; \$1,500 guaranteed to the three high guns; \$600, \$500 and \$400; all surplus added.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Sec'y.

April 5-8.—Baltimore, Md.—Annual spring tournament of the Baltimore Shooting Association. Geo. L. Harrison, Sec'y-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 7-9.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting park, under the management of J. A. Corry.

April 13-15.—Atchison, Kan.—Manufacturers' fourth annual tournament. Added money later. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 19-22.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds: 25 birds, \$25, handicap, \$50 added.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, manager. Address all communications to J. L. Head, Peru, Ind.

May 17-20.—Tournament of the New Jersey State Sportsmen's Association. T. H. Keller, Sec'y.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 30.—Canajoharie, N. Y.—Décoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 8-9.—Findlay, O.—Annual tournament of the Magastrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League of Indiana, on the grounds of the Limited Gun Club.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Blue-locks thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the 500 Gun Club. Three sets of traps. W. F. Duncan, Treas.

July 19-21.—Palmyra, Mo.—Eighth annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Sec'y.

After serving on the FOREST AND STREAM staff for more than three years in editorial conduct of the Trap department, Mr. Edward Banks has resigned the field of journalism to become secretary of the American E. C. & Schultze Powder Co., of this city. Under his capable charge our Trap columns have won universal recognition, popularity and respect for their admirable news service, technical accuracy, originality, impartiality and conceded influence. No more felicitous wish could be framed for him than that a corresponding success may attend him in his new field, and that his relations with his associates there may be as cordial and pleasant as those which without exception have characterized his connection with the FOREST AND STREAM and its staff.

EDITOR FOREST AND STREAM.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Writing from Lake Charles, La., A. W. du Bray says: "I have had a splendid time here shooting with my old friend, Mr. J. C. Elstner. On the first day, leaving town about 9 A. M., and returning before 6 P. M., we bagged 29 quail and 18 snipe. On the second day we left the hotel about 7 A. M. and returned by 6 P. M., bringing with us 91 snipe and 16 quail. On this day we had with us Mr. Roberts, cashier of the Calcasieu Bank, of this town; it was his maiden attempt at snipe, and he bagged 7. We would have killed a good many more birds had not Mr. Elstner soon run out of shells with suitable loads for snipe, and had to use No. 5 shot, which seemed to scatter so badly that his shells were very ineffective at anything at over 35yds. The snipe were very wild from the beginning, and as we found them all in one old rice field, they became worse and more so after every turn up and down. I am not trying to make any apologies, but am merely stating the facts as they were. There is always a certain amount of uncertainty about finding snipe, but none at all as regards quail. Any good shot can come here with a good dog and bag from 25 to 50 quail a day, and keep it up at that rate, for they are very abundant. At some distance from here, say 15 or 20 miles, we can still find prairie chickens, bags of from 10 to 20 being occasionally made as late in the season as February. This is a beautiful country—level roads, hospitable people, and a great game section. Above and beyond all this, one can be most comfortably housed and extremely well fed at the Hotel Howard; and you can take my word for it that you will always find Mr. Pierre Theaus, the proprietor, a most complaisant host, and one who is always ready to make his guests feel at home. I have had a good deal of experience in this line, and I know how essential it is to find just such a place as this. On this hunt I used for the most part my heavy 16-bore, full-choked Parker, with 3drs. of Du Pont smokeless and 1oz. of Tatham's 8 $\frac{1}{2}$ chilled, in a 2 $\frac{1}{2}$ U. M. C. smokeless shell. I found this a great combination, and will refer any doubting Thomas to Mr. J. C. Elstner, who can testify as to the distance at which the gun and load can and do upset a snipe." It certainly seems to us that our good friend Du Bray has more of the good things of this life than ought to fall to his lot. Why should we be up here, etc.?

So Bill Clark has not quit pigeon shooting, but is only laying low for champions and others. Here is an item from the Pittsburg, Pa., Leader of Feb. 2: "William H. Hill, the champion live-bird shot of New Castle; and W. G. Clark, the champion of Ellwood City, shot a match at New Castle yesterday afternoon at 25 live birds. It was witnessed by a crowd of 500 people. There was a heavy wind blowing at the time, and the snow was falling the greater part of the afternoon. Clark had killed 23 and Hill 22. The two will shoot again under more favorable weather, after which they expect to challenge any two shooters in Allegheny county."

The Pawling, N. Y., Gun Club has grounds within 90 minutes of New York city, the route being via the Harlem River branch of the New York Central. This club announces that it will hold a target shoot on Feb. 22, Washington's Birthday, the shoot commencing at 9 A. M. sharp. The programme consists of six 10, three 15, and three 20-target events, at a uniform entry fee of 10 cents per target. All events will be shot at unknown angles from three traps, set Sergeant system. Under twelve entries, three moneys; over twelve entries, four moneys. Special rates will be made at the Dutch House to all visiting sportsmen.

Mr. Charles F. Offerman, president of the Jeannette Gun Club, of New York, and a member of many another gun and rifle organization in this city, died on Thursday last, Feb. 3, aged fifty-one years. One of Mr. Offerman's very many friends sends us the following note: "He was one of the most whole-souled sportsmen who ever put a fowling piece to his cheek. Charley Offerman was president of the Jeannette Gun Club and a member of the New York Schuetzen Corps and of the New York City Schuetzen Corps. In person he was about 5ft. 5in., and weighed somewhat over 200lbs. His jollity at every shoot that he attended was sufficient to drive away any attack of the blues; it was impossible to be sad when he was around. Although he seldom made big scores, he was a most faithful member in the matter of attendance, and his influence and means were always at the command of the clubs of which he was a member. He owned many a good dog and many a good gun. He had a fund of anecdotes of adventures on flood and on field, and his comical way of relating these experiences will be missed very much by those who were fortunate enough to accompany him on any of his hunting trips. It is only a little more than a month since he was unanimously re-elected president of the Jeannette Gun Club at the annual meeting of that organization, the members present being his guests after that meeting at a game supper, as related recently in the columns of FOREST AND STREAM.

The London Field in its issue of Jan. 8 has this to say regarding Mr. Donald McIntosh's account of his experiences over European traps: "Mr. Donald McIntosh, the successful Australian pigeon shot, has been relating in the Melbourne Sportsman his recent experiences of European pigeon shooting. The English marksmen shoot, he says, very quickly and get marvelous results, the second barrels being exceptionally fine. In Italy the boundary is 17 meters, and elsewhere on the continent it rarely exceeds 23 meters, thus making snap-shooting a necessity. The Italian shooters mostly use barrels ranging from 26 to 28in. long, Mr. McIntosh was nearly always shooting from the limit mark, and at Ostend, where the record number of 233 competed, he was the only man shooting from 29 meters. Throughout the tour, extending over two years, he used Schultze powder and a Greener gun, and his wins, which totaled over \$3,500, included the Gun Club (London) challenge cup (210oz. of silver), Amberite cup, a silver trophy presented by Prince Schirinski, of Russia; the championships of Ostend, Cannes and Rome, and a large number of medals and trophies. Mr. McIntosh speaks in warm terms of the hospitality extended to him by Lord Westbury, Mr. Roberts, M. Journu and others, and in conclusion expresses the opinion that England and Scotland are the finest game shooting countries in the world." [Note:—A meter is about 39 1-3 in.]

"A mystery solved" would perhaps be a more fitting title for the following than that of "Drivers and Twisters." On Wednesday last, Feb. 2, Capt. Money was one of the first to arrive at the club house of the Boiling Springs Gun Club, of Rutherford, N. J. On his way from the station to the club he came upon a track that looked just as if some one had wheeled a bicycle through the deep snow down to the shooting grounds. These grounds face the meadows that run down to the Hackensack River. Across the meadows went the track, with the footprints of two men alongside. Capt. Money and John Rock, the club's manager, looking at the tracks, agreed that here was a mystery. Some one had stolen a bicycle, and had made off across the meadows with the stolen property! When we arrived Capt. Money pointed out the tracks and gave us his theory of the reason for their appearance. It did look suspicious. Just as we were going in to get some lunch two men appeared on the meadows, and it soon became evident that here were the bicycle thieves. One man had on his shoulder a gunny sack, while the other trailed behind him an eel spear! They had been spearing eels through the ice! As soon as they had passed the house it looked as if a two-wheeled cart had been driven across the meadows, and the stolen bicycle theory was as utterly shattered as were Capt. Money's 48 out of his 53 targets in the prize shoot that same afternoon.

We are told that the proposition made for an English and American team race at the traps, mentioned in last week's Drivers and Twisters, was for a target race, not for one at live birds. It looks as if this were so, judging from the following letter written to the London Field of Jan. 29 by Mr. Max Baker, secretary of the Inanimate Bird Shooting Association of Great Britain: "I notice with much interest the proposal made in your columns that encouragement should be given to a team of American shooters to come over to this country and take part in the annual championship meeting of the Inanimate Bird Shooting Association. I feel sure that this proposal will be most favorably received by the members of our association, though until after our annual meeting, the 31st inst., no steps can be taken to deal with the matter in a formal way. The great interest which is always shown in team contests, where the competitors are fairly well matched in strength, has frequently been noticed at the different championship meetings of this association, while the smaller contests, which take place at the meetings of private clubs, serve in an equal measure to illustrate how popular an English versus American team event would prove as an item in our forthcoming championship programme."

E. D. Fulford has sent us a blue print showing transverse and longitudinal sections of the trapper's pit to be used with his system of underground trapping and retrieving. The scheme was put in practice to a certain extent at the last Baltimore shoot, and was a very great improvement over the old style. By means of his latest improved system, which will be in full operation at the Utica tournament, March 15-18, he claims that it is possible to trap and retrieve 300 birds per hour. Fulford is also bringing out a new live-bird trap that he claims is "the best on earth."

Miss Annie Oakley now possesses one of the best trained horses in the world. We have the word of others for this fact, besides that of Frank Butler. This horse was a blue ribbon winner at the late horse show in Madison Square Garden, and is, of course, as perfect as they make them. Miss Oakley is going to vary her programme with a high school act, and this horse is to be her assistant. Mistress and horse so thoroughly understand each other now that when the time comes there will be no prompting necessary.

Saturday next, Feb. 12, is Lincoln's birthday, and on that occasion the Bergen County Gun Club, of Hackensack, N. J., has arranged to have a field day at targets. The first event scheduled for the day is a merchandise event. The next is the contest for the President's Cup, a silver trophy donated for competition by the president of the club, Mr. Geo. P. Griffiths. The conditions are 50 targets, unknown angles, \$1.50 entrance, cup to become absolute property of the winner, 50 cents to be deducted from each entry to form a fund to be divided into three moneys, 50, 30 and 20 per cent., to go to the next three high guns. The cup race will be started at 1 P. M. At 3 P. M. there will be another merchandise event. The club has just placed in position a set of bluecock expert traps. Lunch will be served on the grounds free of charge to the club's guests. In its announcement the club says: "We can guarantee you a good time and lots of shooting."

The Keystone Shooting League, of Holmesburg Junction, Pa., announces that it will hold a 25-bird race, handicap, open to all, on Feb. 22, Washington's Birthday. There will be \$150 guaranteed as follows: \$75 to first, \$50 to second and \$25 to third; class shooting. For every two entries over 15 there will be an additional money of \$20. Entries \$10, of which \$2.50 must be posted with George E. Pack, secretary, by Saturday, Feb. 19, before the handicaps are announced. Entries received after this date will shoot at the limit, 30yds. Shooting in the event will start at 10:45 A. M., and in case the shoot is not finished by night it will be continued at 2:45 P. M. Wednesday, Feb. 23, the following day. Shooters who arrive late on the grounds will be allowed to shoot up until the completion of the third round. The handicap committee is made up as follows: W. H. Wolstencroft, W. M. Pack and H. L. David.

The Middlesex Gun Club, an organization in New Jersey that has grounds at South River, N. J., will hold a live-bird shoot on Feb. 12, Saturday next, Lincoln's Birthday. Stages will meet the trolleys from New Brunswick and Milltown from 9:30 A. M. until 3 P. M. Shooting commences at 10 A. M. sharp. Birds furnished at 25 cents each. The shoot will be managed by H. H. Stevens, who has gotten up an interesting programme for the day's sport. The main event is the Middlesex Club prize shoot, 10 birds, \$5, birds extra; high guns, one man to one money; four entries, two moneys, and one money for every additional four entries or fraction thereof. Ties to be shot off at three birds, then miss-and-out. Professionals barred. The management will give handsome prizes to the two high guns in this event.

Mr. V. D. Kenerson, secretary of the Worcester Sportsmen's Club, writes that his club will hold an all day target shoot at North Pond Shooting Park on Feb. 22, Washington's Birthday. A good programme will be arranged, and everybody is to consider himself invited.

The Bound Brook, N. J., Gun Club will hold its opening shoot at live birds on Feb. 22, Washington's Birthday. The shoot will begin at 10 A. M.

Mr. A. C. Paterson, of Chicago, writes us as follows: "Col. A. G. Courtney, of the Remington Arms Co., while at Dayton, O., recently, indulged in a warming-up race for the Indianapolis and Hot Springs shoots with Rolla O. Heikes, of that city. The Colonel proved himself equal to the occasion, and kept Rolla trotting close to his mark. The race was at 100 targets, known traps, unknown angles, with the result as follows: R. O. Heikes, 24, 23, 25, 25—97; A. G. Courtney, 24, 23, 22, 24—93. Rolla's activity as a pedestrian on the march from trap to trap slightly outwinded his 285lb. opponent, Mr. Courtney, in the last frame of 25, and the Colonel firmly believes that he would have made a better finish were it not for this. He has been doing good shooting with his new Remington of late."

Mr. W. F. Duncan, treasurer of the Soo Gun Club, of Sioux City, Ia., writes us under date of Jan. 30 as follows: "Will you kindly change the dates of the announcement of the Soo Gun Club tournament to June 21-23. Several meetings of importance are scheduled in this vicinity on the dates first selected, hence the change. The Soo Gun Club has filed articles of incorporation, capital \$3,000. The following officers have been elected to serve for the ensuing year: President, C. C. Hamilton; Vice-President, J. W. Boyd; Treasurer, W. F. Duncan; Secretary, E. R. Chapman; Captain, H. H. Hawman. Executive Board: C. C. Hamilton, W. F. Duncan, E. R. Chapman, H. H. Hawman, W. W. Harris, J. W. Gray and John Otten."

The Union Pacific Railroad has issued a pamphlet containing the A. S. A. rules for live-bird and target shooting, and also the rules for live-bird shooting issued by the London Gun Club. The pamphlet, which is gotten up in a neat form, also contains the revised game laws of the Western States, with the following cautionary note concerning these laws: "The game laws printed herein are corrected up to date. Owing to the frequent changes being made at the session of each Legislature, we would advise sportsmen and hunters to make inquiry from the State or Territorial officials to learn if any changes have been made."

Another good man is going to the Klondike. Joe Bourke, one of the king-pins of the Cuckoos, of Rockaway Park, L. I., has decided to try his luck among the icebergs and mosquitoes of Alaska. Mr. Bourke's friends have no qualms as to his ability to successfully withstand the attacks on his constitution by both the above-mentioned denizens of the Yukon Valley; his training, winter and summer, at Rockaway Park, where both articles abound in their proper seasons, being supposed to have inured him to the rough edges of Alaskan life. If there are any nuggets lying around loose when Mr. Bourke gets to Dawson City the Bourke pocketbook will not go empty.

Among the entries for the coming Grand American Handicap will be John J. Sumpter, Jr., of Hot Springs, Ark. Mr. Sumpter was one of those who wrestled with the good birds dished out to the entries in last year's Grand American, and his score of 23 out of 25, one dead out of bounds, 29yds. rise, shows that the Arkansas Traveler was not placed far from his mark. It was on John Sumpter's broad shoulders that Tom Marshall made his triumphant circuit of the Elkwood Park club house after winning the Grand American Handicap with the only 25 straight made in this event in two years.

Mr. W. N. Bates, secretary of the Missouri Amateur Shooting Association, writes us that their annual tournament will be held at Palmyra, Mo., July 19-21, under the auspices of the Palmyra Gun Club. Several hundreds of dollars will be added to the purses, but the exact amount is not known at present. There will be events at both targets and live birds, the targets being thrown from a magautrap. The club is possessed of excellent grounds, and promises to hold a shoot that is up to date in every respect.

The invitation live-bird shoot of the Brooklyn Gun Club was a great success. It was held on Thursday last, Feb. 3, at Dexter Park, L. I., and was very well attended. Owing to the number of entries it was impossible to shoot the programme through, only one set of traps being available. That the shoot was a success was due in no small degree to the personal popularity of the club's manager, John S. Wright, who has worked indefatigably in the interests of trap-shooting around New York.

The event known as the Amateur Championship, which has heretofore been decided on the grounds of the Larchmont Y. C., will this year be held on the Carteret Club's grounds at Garden City, L. I. The dates are Feb. 22-23. Last year R. A. Welch, of Philadelphia, won the cup and first money on 92 out of 100. The wind blew a gale from the northwest the greater part of the two days, and Welch's score was head and shoulders over that of his nearest competitor. Capt. Money will act as referee this year.

The handsomest caribou head we have ever seen, without any reservation at all, is the one now on view in the window of Von Lengerke & Detmold's store, 318 Broadway. This head belonged to a caribou shot recently in Newfoundland by E. G. Asmus, a florist, who resides in West Hoboken, N. J. It was mounted by S. L. Crosby, of Maine, and is said to beat the record head by four points, having a total of just fifty-four points on a most perfect spread of antlers.

Mrs. M. F. Lindsley was one of the spectators at Dexter Park on Feb. 3. Mrs. Lindsley does not care for live-bird shooting, but promises as soon as the warm weather comes she will be on hand and break a few targets with Kinn's Smokeless and Peters's Cartridges. We are well aware of the fact that Mrs. Lindsley can break targets, no matter what powder she uses; but when she uses the powder that Milt makes, why then she tries her best, and some people that we know well have to take a back seat.

The St. Thomas Gun Club, of St. Thomas, Ontario, Can., will hold a tournament at live birds and targets March 8-10. The tournament will be under the management of Jack Parker, the same Jack Parker who so successfully ran the recent shoot at Hamilton, Can., and who is sometimes known as Des-Chree-Shos-ka Jack. There will be added money and an international live-bird trophy for competition as attractions at this shoot.

The Endeavor Gun Club held its annual meeting on Wednesday evening, Feb. 2, and elected the following officers for 1898: President, Dr. Z. P. Fletcher; Vice-President, A. R. Strader; Secretary, R. Hollister; Treasurer, A. K. Strader; Captain, Ed Taylor; Shooting Committee: Carl von Lengerke, Ed Taylor and E. Banks. The club's treasury is in a satisfactory condition, and it was decided to hold a series of shoots during the coming season.

Dr. G. V. Hudson, a member of the Hudson Gun Club, and of the New York German Gun Club, both New York city organizations, has recently added to his personal property by winning the silver pitcher and two goblets, which formed the first prize offered for competition in 1897 by the New York German Gun Club. In all the contests for this trophy the Doctor shot Hazard's Blue Ribbon.

We have no idea what sort of a record has been made on five birds by a squad of six men shooting out their 20 birds each—that is, 120 to the squad. Below are the scores made by a squad in the Grand Canadian Handicap at Hamilton, Can., Jan. 19 last: B. A. Bartlett 20, L. W. Bennett 20, F. D. Kelsey 20, Brady 19, Fulford 19, Brooks 18; total, 116 out of 120 shot at. The above is a record hard to beat on any class of birds.

Since leaving New York after the Sportsmen's Exposition, Elmer Shaner has been confined to his bed with threatenings of pneumonia. But sickness was not allowed to interfere with getting out the programme for the Grand American Handicap on time. Accordingly we are able this week to give the programme in detail, and are glad to find, as we expected, that it affords some good reading matter.

The fifth annual tournament of the Arizona State Sportsmen's Association will be held in Tucson, Ariz., Feb. 20-22, under the auspices of the Blue Rock Gun Club, of Tucson. Live birds and targets will be trapped. The local shooters are doing their best to make this shoot a big success, and from the present outlook the tournament will be one of the best ever held in Arizona.

For the benefit of those who wish to attend the tournament of the Pawling, N. Y., Gun Club on Washington's Birthday, Feb. 22, a special rate of \$2 per day will be made to shooters at the Dutcher House, Pawling is only ninety minutes' ride from New York city on the Harlem Railroad, and can be reached very easily by rail, there being eight fast trains each way every day.

A new gun club has been organized at Scotia, Neb., the organization taking place on Jan. 27. The club starts in with a membership of fourteen. The officers elected were: President, R. M. Krebs; Vice-President, M. M. Hicks; Secretary, Sam F. Graham; Treasurer, Fred Burton; Manager, J. M. Vanskike.

The Lexington, Ky., Gun Club announces that it will hold a two days' shoot on Feb. 22-23. Targets, crows and pigeons will be trapped during the tournament. Further particulars may be had by addressing Mr. V. K. Dodge, the club's energetic secretary.

Charles A. Macalester, of Baltimore, Md., is spending a few weeks at Hot Springs, Ark., and is doing some live-bird shooting. He expects to be back in Baltimore about March 1. That the air of Hot Springs agrees with him is evident from his scores. Note his 31 out of 33 in his match with John J. Sumpter, Jr.

John J. Hallowell, of the U. M. C. Co., came over from Bridgeport, Conn., on Wednesday night last, Feb. 2, to attend the invitation shoot of the Brooklyn Gun Club at Dexter Park on Feb. 3. John J. was shooting in good form, but a sitter in the 10-bird race caused him to lose the amiable smile so very generally seen on his face when facing the traps.

The Lyndhurst, N. J., Shooting Association will hold a live-bird shoot, 25 birds per man, \$10 entrance, birds extra, on Thursday, Feb. 17. The grounds of the Association can be reached in thirty minutes from New York by the Erie to Rutherford, or by the D. L. & W. to Lyndhurst. T. W. Morley is secretary of the Lyndhurst Shooting Association.

Noel E. Money has already done some shooting on the Riviera. On Tuesday, Jan. 18, he ran 22 straight at Nice, and has also tried his hand at Monte Carlo. In a letter dated Jan. 23 he writes: "Hope to win some of the big things next week." As will be noted elsewhere in these columns, under the head of Monte Carlo, Mr. Money was not fortunate enough to come out on top on either Jan. 24 or 25.

The New Haven, Conn., Gun Club will hold an all-day shoot at targets on Washington's Birthday, Feb. 22. Further particulars as to programme, etc., may be had by addressing the secretary, W. H. Hazel.

Memphis is not going to be left out of the deal when it comes to trying for first honors in the Grand American Handicap. Frank Posten and a few others will be on hand on March 22-24 next.

FEB. 8.

EDWARD BANKS.

WESTERN TRAPS.

Death of James E. Hagerty.

CHICAGO, Feb. 5.—Mr. James E. Hagerty, of St. Louis, Mo., better known in trap-shooting circles as Jimmy Hagerty, died at his home in St. Louis Monday afternoon, Feb. 1, an illness of some weeks terminating suddenly and fatally after exposure to inclement weather on Monday morning. Mr. Hagerty was a politician and a successful business man, but always found time for indulgence in his favorite sport of pigeon shooting, in which he was no novice. His race with W. P. Mussey, of this city, some years ago, in which Mr. Hagerty won handily, is brought to mind to-day. Mr. Hagerty leaves many friends in the shooting world.

Trap at Hot Springs.

Gov. Tanner, of Illinois, continues to engage in the sport of pigeon shooting with his friends Messrs. J. W. Gates, L. L. Ellwood and J. A. Drake. The shooting has been at Whittington Park, and with the following results: On Jan. 28 each man shot at 50 birds. Gov. Tanner and Mr. Gates at 31yds., the other gentlemen at 21yds. Score: Gov. Tanner 38, Mr. Drake 39, total 77; Mr. Gates 36, Mr. Ellwood 29, total 65.

On Jan. 29 the same gentlemen resumed their contests, 500 live birds having been ordered from St. Louis. The shoot was at 25 live birds each, the score being: Gov. Tanner 16, Mr. Drake 19, Mr. Gates 21, Mr. Ellwood 18. Gov. Tanner then shot another match at 25 birds with Mr. Hopkins, of St. Louis, the score being a tie on 14.

On Feb. 1 Gov. Tanner and Mr. Drake were again partners, but were defeated by Messrs. Gates and Ellwood. Score, at 50 birds per man: Gov. Tanner 29, Mr. Drake 29, total 58; Mr. Ellwood 30, Mr. Gates 31, total 61.

On Feb. 2 the same gentlemen kept on in their interesting series of races, with exception that Mr. Ellwood was not present. Gov. Tanner showed improvement in form and shot a good gait. He killed 73 birds out of 85, near 86 per cent., and in one run killed 22 straight. In the three-cornered race the scores were as follows, at 25 birds: Gov. Tanner 20, Mr. Gates 22, Mr. Drake 17. Mr. John J. Sumpter, Jr., then took the place of Mr. Ellwood, and a two-men team race was shot with the following results, at 25 birds each: Gov. Tanner 24, Mr. Gates 23, total 47; Mr. Drake 15, Mr. Sumpter 22, total 37. The race was repeated, Mr. Drake having 5 dead birds added to his score, and the result was a tie, which was won by Messrs. Sumpter and Drake.

On Feb. 3 Gov. Tanner refereed the live-bird match between Mr. Chas. Macalester, of Baltimore, and Mr. John J. Sumpter, Jr., of Hot Springs. The dispatches say that the contestants shot at 33 birds each, Macalester scoring 31 and Sumpter 28. Sportsmen of Illinois are glad to see their head executive not only taking interest, but making improvement in the sport of the traps. Above all things, let him beware of making matches with either Mr. Macalester or Mr. Sumpter. He would better confine himself to refereeing all such races, and not mix up with men who, while they are innocent of look, would be just as willing to beat a governor as any one else.

At Kansas City.

Pastime Gun Club, of Kansas City, held its monthly contest at Washington Park last week. Dan Quinn (Mr. Lewis, of the K. C. Star, author of "Wolfville") was present. Lee Porter won the shoot-off in his tie on 15 straight with W. V. Baker. Those Kansas City folks are warm ones. Score:

W. V. Baker 15, J. L. Porter 15, Dr. Longfellow 14, Dan Quinn 6, J. B. Porter 12, Dr. Heaman 10.

The Metropolitan Target Club, of Kansas City, met at Washington Park Jan. 29 and elected officers for 1898, Mr. J. W. McCurdy being chosen president and Mr. Dave Elliott secretary. The club will make 50 targets its regular medal score. Mr. Akart, of Fair Play, a visitor at the grounds, made top score of 41, the scores of the members being as follows:

C. F. Jarvis 38, L. W. Scott 38, Dave Elliott 38, Nelse Jarrett 38, Newt Beach 36, T. F. Norton 35, J. W. McCurdy 35, C. J. Munson 35, Bob Ostertag 34, J. W. Brown 31, W. M. Hoke 33, L. Erhardt 33, T. H. Hearn 32, W. F. Bruns 30, J. D. Sombier 30, G. W. Stockwell, Jr., 24, W. A. Laidlaw 22, Brady 17.

In Louisiana.

Mr. W. P. Miles, Jr., under date of Jan. 30, sends me from Burnside, La., the following scores of a warm little tournament at birds and targets. Mr. Miles calls attention to the fact that our friend Tom Divine, of Memphis, shot his live birds like an old stager. The birds were good and strong, needing no flush ropes. The event must have been a pleasant one. Scores:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	10	25	15	20	15	25	Targets:	10	25	15	20	15	25
Hood	9	23	11	18	9	20	J. K. Tucker ..	5	7	4
Bringier	6	16	14	16	10	12	Dalferes	10	16	7	13	12	...
T. A. Divine	10	16	13	16	14	21	Stuart	5	17	11	13	6	...
George	5	18	8	11	11	17	Dr. Davis	6	19	9	18	14	18
Breaux	9	20	12	11	9	39	Parker	6	9	10	13	9	21
Boote	8	24	10	14	14	19	Green	17	...	9	11	...
Bentley	5	...	1	0	1	...	Mire	17	11
Bentley, Jr.	4	...	4	7	4	...	Le Blanc	6	6

Davis	8	17	11	14	11	19	Hunt
Dr. Colomb	5	12	6	14	9	15	W. Breaux

Live bird scores were:	No. 1.	No. 2.
Hood	1120121220—8	11010—3
Bringier	2**1001020—4	01112—4
Breaux	12101010*—6	0101*—2
Divine	2121122112—10	12111—5
J. Tucker	10102—3
D Bentley	02011—3

At College Corner.

Mr. L. H. Reid, secretary of the College Corner Gun Club, of Ohio, writes me, inclosing the scores of that club at its club medal shoot, Feb. 4. "Most of us are new shooters," says Mr. Reid, "but we want to learn." Score, 25 targets: R. Caldwell 13, D. Smoyer 20, J. Bergen 10, E. Wright 14, L. H. Reid 16.

At Henry.

The officers of the Henry, Ills., Live Bird Club beg to call attention again to their tournament, Feb. 22, 23. They will add \$100 in merchandise prizes Feb. 23. The club will take good care of visiting shooters, and its tournament deserves hearty patronage. Programmes from W. H. Forrest, Sec'y.

At Cleveland.

The Glenville Gun Club, of Cleveland, O., will hold Saturday matinee shoots during February, March and April, offering ten prizes for the highest scores in any six of the twelve club shoots. The club will hold an open tournament Feb. 22. The following board of directors has been elected for the ensuing year: S. C. Fellows, J. H. Robinson, R. O. Hopkins, Harris Creech, J. C. McMichaels, C. L. Wirls, R. W. Stirling, W. H. Levy and P. S. Evans. R. C. Hopkins was elected president and J. C. McMichaels secretary.

At Dallas.

The tournament at Dallas last week under management of Mr.

F. M. Faurote was successful, with a good representation from the stronger gun clubs of northern Texas. A little live-bird sweep was shot the first day with about a dozen entries, and Mr. Faurote and Mr. W. F. Norman, of Greenville, tied on 10 straight.

At Savannah.

The Savannah Blue Rock Club, of Illinois, is a young organization, but is starting off at a hot gait, as may be seen in the medal shoot last week, in which the following scores were made:

J. Loetz 27, R. A. Cassell 24, W. B. Johnson 24, O. A. Manning 21, F. Loughran 21, F. E. Lewis 20, C. W. Canine 20, J. Rittenbour 17, W. G. Law 16, D. S. Berry 16, A. P. Woodruff 16, A. O. Elliott 16, C. E. Miller 11, G. Cottrall 9, A. A. Haberbush 9, C. W. Green 9, F. R. Benedict 7.

M. W. Dupuis 13 out of 24, Wm. McElhane 11 out of 24.

At Waterloo.

The Waterloo Gun Club, of Iowa, tried out its new handicap rules Jan. 31, some twenty-five shooters taking part. The handicap gave general satisfaction. The Globe cup was won by Jones, one of the scratch men. The Wood & Wyant cup was won by Will Burk, with a handicap of 8. He captured 12 birds out of 20 shot at, giving him a straight score. Jones won the Joder prize after tying with Ward, both scratch men.

At Green Bay.

At Green Bay, Wis., Jan. 30, B. Clafin, with a score of 17 out of 25, won the challenge medal for the second time. The contest was between Clafin and Gus Schiller, and the latter has challenged for another contest.

At Oshkosh.

A number of members of the newly organized Winnebago Gun Club met for a little practice shoot at five birds last week, the shooting being done on the ice at the foot of East Irving street. The gentlemen seemed to take kindly to the sport, for at 10 birds straights and 9s were numerous.

Notes.

At Royal Center, Ind., a gun club was organized last week with the following members and officers: Geo. W. Weyand, Geo. Conn, Frank Gehl, C. C. Kistler, Charles Bennett, M. A. Weyand, W. H. Bingham, Geo. Schleintz, E. B. Thomas, J. L. Thomas, John Uebelhouser. The officers chosen were: President, M. A. Weyand; Secretary, W. H. Bingham; Treasurer, E. B. Thomas.

At Grafton, S. D., petty thieves this winter stole about all of the apparatus of the gun club, and even carried away the bank of dirt which was used to screen the traps, thus proving the value of Dakota real estate in the eyes of those who ought to know. The club resumed operations this week, the mayor of the town, Mr. Smith, being high gun in the club scores.

The Tacoma Rod and Gun Club, of Washington, last week began improving its grounds, and will spend several hundred dollars putting in new fences, buildings, etc., and completing its battery of traps.

The East Side Gun Club, of Saginaw, Mich., will improve its grounds and buildings for the coming season. The Sergeant system of shooting will be adopted. During the coming season two tournaments will be given, one for amateurs and one open for all. Both these events promise to be interesting and well attended.

We have lots of crows out in this country, but we don't shoot them at the trap, and there is a tacit belief among our sportsmen that they do not form a sportsmanlike target for the traps. This comes to mind on seeing a statement in the Baltimore Sun to the effect that shooters of Kent county, Md., are enjoying the "rare sport" of shooting crows at the trap. The crows purport to have been captured on their roosts in considerable numbers.

The badge of the Freeport Gun Club, of Illinois, has been won three times by Steven Steffen, and is now his property. The club will offer a new one.

Mr. S. A. Tucker, of the Parker gun, made this city a visit last week. Col. A. G. Courtney, of the Remington gun, was in town this week. Mr. C. E. Willard, of the Colts Co., is expected in town next week. E. Houghton.

1206 BOYCE BUILDING, Chicago.

CHICAGO, Feb. 5.—Since the publication of my acceptance of W. R. Morgan's challenge for the Cook County E. C. challenge cup in your last issue, I have received a letter from Mr. Morgan requesting that I withdraw his challenge, and it is hereby withdrawn. His reasons for such action are on account of the uncertainty of his being in Chicago at the time the race would be shot, together with a desire to allow others to challenge for the cup.

Bingham Challenges Paterson.

"Feb. 4, 1898.—I hereby challenge Mr. A. C. Paterson, the present holder of the Cook county E. C. challenge cup, under the conditions governing the same.—ED. BINGHAM."

Cook County E. C. Challenge Cup.

There is one part of the newly issued rules governing the E. C. cup which in my opinion will work unfairly and to the disadvantage of the members of Calumet Heights Club, which is one of the clubs which form the league. Under the rules previously issued the holder of the cup had the privilege of naming the grounds on which contest would be s. o. t., also the style of race in accordance with the American Association rules. It certainly was to the advantage of the holder of the cup to name grounds and style of shooting. The last contest was shot on the grounds of the Calumet Heights Club, which club is a Cook county organization, and all of its members live in Chicago, though its grounds are over the line in Indiana.

One of the original scores which won the cup in 1896 was shot on the grounds of the Calumet Heights Club. The league has held contests on the grounds of this club each year, and its members have regularly attended all league events.

The new rules make it necessary to have all contests for the E. C. trophy shot on grounds in Cook county. This takes away any and all advantage from a member of the Calumet Heights Club, as a holder of the cup, in depriving him of the privilege of naming his own grounds for a contest, which advantage is extended to other clubs of the league.

While there are some few members of Calumet Heights Club who are also members of other clubs of the league, there are many who do not so belong, in consequence of which they shoot on the grounds at Calumet Heights only. A. C. PATERSON.

Stoney Island Avenue Gun Club.

Feb. 5.—The shoot for the live-bird medal of the Stoney Island Gun Club, held to-day, was long and interesting. Zimmerman finally captured the medal after scoring 47 out of 48. Scores:

Club shoot, 10 birds, handicap allowances of misses as kills: Zimmerman1122222212—10 Capt. Fyfe, 12220202211—9 L. Willard1221111211—10 Wells, 20002021212—8 C. Porter, 22012111121—10 E. Marsh1202011022—7 A. Reeves2212222211—10 H. A. Davis, 10201002111—7 F. Willard2112122202—9

Ties shot off at 10 birds:

	No. 1.	No. 2.
Zimmerman	2111222121—10	111111111—10
L. Willard	1112112212—10	1110
Porter, 2	0112011112—10	2121222122—10
Reeves	1221221212—10	1221210

	No. 3.	No. 4.
Zimmerman	1211111211—10	10211111
Porter, 2	2221012022—10	2000220

Porter used his allowance of 2 misses as kills in the series Nos. 1 and 3 of the shoot-offs, but retired in the fourth shoot-off, being shot out. E. PORTER, Sec'y.

Palmetto Gun Club, of Aiken, S. C.

AIKEN, S. C., Jan. 31.—The Palmetto Gun Club, of Aiken, S. C., is a recent organization, that has its grounds at this place. The officers are: President, D. Long Miller, of Louisville, Ky.; Vice-President, G. Smith, New York; Secretary-Treasurer, E. R. Grabow. Among the members are Mr. and Mrs. Thomas Hitchcock, Mr. and Mrs. C. Havemeyer, Messrs. Valentine Mott, Foxhall Keene, Ed L. Smith, Nat. Simpkins, Rollin Smith, Herman Dur-yea, Duncan Elliott, etc.

The first shoot of the club was held to-day, the scores made being as follows:

	No. 1.	No. 2.	No. 3.	No. 4.
T. Hitchcock	03202—3	02020—2	22202—4	...
Foxhall Keene	20000—1	20120—3	22222—5	111—3
D. Long Miller	11111—5	12110—4	12221—5	110—2
N. Simpkins	22200—3	22221—5	110—2

The tie in No. 3 was shot off, Miller winning in the first round, both his opponents losing their birds. Sec'y.

At Monte Carlo.

Prix des Amandiers.

Jan. 21.—The weather to-day was very fine, and there was an absence of wind, the birds being thus somewhat easy to kill, 9 shooters being left in at the end of the 7th round. The 8th proved fatal to the sole representative of France, M. Drevon, and to Signor Asti Cesare, and with Signor Randi going out in the next, 5 of the 6 still without a zero were English. Of these Mr. Draffe failed at the 10th round, in which Mr. Bullets, Mr. W. Rogers, an American, Mr. Curling and Mr. W. Blake killed. The two latter both missed the 11th, and as Mr. Bullets and Mr. Rogers killed they agreed to divide first and second money, Mr. Curling and Mr. Blake doing the same with the third prize. Scores:

Prix des Amandiers Handicap of £40, added to a sweepstakes of £2 each; second received 30 per cent. of the entries; third 20 per cent.; 61 subs.: 25½, Mr. W. Rogers, divided first and second prizes of £116, 11; 24, Mr. Bullets, ditto, 11; 26, Mr. W. Blake, divided third prize of £40, 10; 24, Mr. Curling, ditto, 10.

Grande Poule D'Essai.

Jan. 24.—The weather to-day was again brilliantly fine when the Grande Poule D'Essai, the first of the two prizes preceding the Grand Prix, was shot. There were 98 entries this year as against 105 last year, when M. Horodetzki was first, Signor Calari and M. Journu dividing second and third money, and Mr. Robinson being fourth. These four all competed again to-day.

The birds trapped by Roberts were of very good quality, and although they had little wind to help them, more than a third got away in the 1st round, among those who missed being Signor G. Grasselli, the winner last year; M. Journu, Mr. St. James, Mr. R. Beresford, Mr. Thellusson and other well-known shots. The 2d round stopped 22 others, and by the time that the 4th had been completed only 17 of the 98 were left in. In the 9th round all the 4 birds were from the middle trap, and while Messrs. Curling and Casapiccola missed, Signor Briasco effected a fine shot with his second barrel, and Mr. Verdavaine killed smartly with his first. The 10th round brought the contest to an end, for while Signor Briasco again effected a smart second from the middle trap—the 5th bird in succession from it—M. Verdavaine was beaten by a twisting bird, which he missed clean with both barrels. The two others had in the meanwhile agreed to a division, and so the shooting came to a very early conclusion so far as this prize is concerned. Scores:

Grande Poule D'Essai of £80, added to a sweepstakes of £4 each; second received £20 and 25 per cent. of the entries; third £12 and 20 per cent.; fourth £8 and 15 per cent.; distance 26 meters; 98 subs.: Signor Briasco (Scott, Schultze), first of £109 and gold medal, 10; M. Verdavaine (Purdey, E. C.), second of £129, 9; Mr. Curling (Brankaert, Schultze), divided £32 and fourth of £120, 8; Signor Cassapiccola (Scott, Walsrode), ditto, 9.

Prix d'Overture.

Jan. 25.—Ninety-eight entries were reported in the Grande Poule D'Essai yesterday, but to-day there were 109 entries, three more than last year, in the Prix d'Overture. There was not much wind to-day, and what little there was died away after about two or three rounds had been shot; thus the birds, good as they were, did not take much killing. But for all that 41 of the 109 shooters went out in the 1st round, including Mr. Erskine, Sir John Willoughby, Mr. Cholmondeley Pennell and Mr. Walters, while in the 2d, 19 more, among whom were Signor Guidicini, Signor Grasselli, Mr. Seaton and Mr. Roberts, all winners of the Grand Prix, were given a zero. But after this the failures were less frequent, and at the close of the 4th round there were still 25 who had killed all their birds, the two next rounds reducing this total to 15. But in the 7th round three of the six Englishmen still left in—Mr. Harding Cox, Mr. W. M. Clarke and Mr. Kennedy—and Signor Riva missed, while the 8th round put out Signor Bellusci, Signor A. Grasselli, a brother of last year's champion, and Signor Querolo, while in the 9th round England's chance of victory was annihilated, for the 4 misses were made by Count Trauttmansdorff, Mr. R. Sneyd, Mr. Poutz and Capt. Vernon. Their failure to kill left the issue to a Frenchman, M. Journu, and three Italians, Messrs. Lanfranchi, Oliva and Seragna. As Messrs. Lanfranchi and Oliva both missed their 10th bird, and agreed to divide third and fourth moneys, the issue was now left to M. Journu and the Marquis de Seragna, the latter a young Italian who shot with remarkable sangfroid, and in the 11th round made a very good second barrel from the second trap. But the 12th round saw the conclusion of the contest, for while M. Journu killed with his first barrel from trap No. 1, the Marquis Seragna let go a rather fast bird from the middle trap. M. Journu probably has never shot in better form than he did this afternoon, and if there was any serious betting on the Grand Prix he and Mr. Roberts would be as good favorites as any of the Italians. This prize was won last year by M. Verdavaine, Mr. McIntosh, who returned to Australia some months ago, being second, Signor Calari third and Signor Rita fourth. Scores:

Prix D'Overture of £120, added to a sweepstakes of £4 each; second received £30 and 25 per cent. of the entries; third £20 and 20 per cent.; fourth £10 and 15 per cent.; 24½ meters; 109 subs.: M. Journu (Purdey), first of £212 and obit d'art, 12; Marquis Seragna (Scott), Walsrode, second of £129, 11; Signor Oliva (Greener), Walsrode, divided third and fourth of £182, 9; Signor Lanfranchi (Scott), Walsrode, ditto, 9.

Notes from Little Rock.

Southwest Kansas and Southwest Missouri Medal.

LITTLE ROCK, Ark., Feb. 4.—On Monday, Jan. 24, C. M. Sumner, of Galena, Kan., and W. G. Sergeant, of Joplin, Mo., shot a match for the Wolfgang medal at Galena. The race was 50 singles, unknown angles. The weather was not very favorable, being dark and threatening, with a good wind blowing. The scores in this event were also very ordinary, as the principals are two of the best shots in this section of the country. Sergeant was the winner with 39 to Sumner's 33. W. W. McIlhany, of Galena, has challenged Sergeant, but as yet no date has been set for the match.

At St. Louis.

Mr. J. A. Corry, manager of Du Pont's shooting park at St. Louis, announces a three days' tournament, April 7-9. This will be strictly an amateur shoot, and the first of a series of tournaments that will be held at the park every ninety days. Targets and live birds will be used, and the schedule of events will be so arranged as to be specially attractive to the amateur shooter.

At Hot Springs.

For ten days past there has been considerable live-bird shooting done. The principals in these events were Gov. Tanner, of Illinois; John W. Gates and Mr. Drake, of Chicago; Charles Macalester, of Baltimore, and John J. Sumpter, Jr. Nearly every afternoon team races have been shot, and yesterday Macalester and Sumpter shot an individual match. It was originally intended that each should shoot at 50 birds, but it was impossible to procure this number, so each contestant shot at 33. Macalester was in rare form and grassed 31, while Sumpter only got 28, with 3 dead out of bounds. Shooters are already beginning to come in for the tournament, as aside from those mentioned above, Dr. J. L. Weller, of Rochester, is also there, and will remain for the tournament. It looks very much as though the 100 mark would be reached when the entries are all in on the first day of the big shoot.

PAUL R. LITZKE.

The Greatest of Them All!

From Shadowgraphs, by Fred Roblin.

He is great who wins in battle,
Likewise he who rules the State;
He is great whose lore and logic
Help him conquer in debate;
He is great who, with his pencil,
Holds Dame Nature up to view—
But the greatest of all mortals
Is the noble Angler who
Can lose Leader, Flies and Fish,
And not lose his temper, too!

The "Brief's" Pictures.

THERE are twenty-nine illustrations in the current edition of Game Laws in Brief, most of them full-page half-tones, and all admirably printed. The book is a beauty, and well worth having for the illustrations which, Mr. Charles Hallock says, so well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

Grand American Handicap.

The Programme in Detail.

ADVANCE copies of the programme for the Interstate Association's sixth annual Grand American Handicap have been furnished us, and below we give in detail the main portions thereof:

Introduction.

In presenting its programme for its sixth annual Grand American Handicap, to be held at Elkwood Park, Long Branch, N. J., March 22, 23 and 24, the Interstate Association feels that it need offer no apology for its choice of grounds as above. The experience of 1897, when the largest number of shooters ever gathered together on any shooting grounds were handled without any trouble, fully warranted the selection of Elkwood Park as the scene of the big event of 1898.

The aim of the Association has been to make the Grand American Handicap the largest event of its kind, and to make it a shoot that shooters like to come to. Its efforts have always been in this direction, and the increased success of each succeeding Grand American Handicap has shown conclusively, that such efforts on the part of the Interstate Association have not been unnoticed or disapproved of by the shooters of this country.

With a view to giving every contestant a fair field and no favor, the handicapping has in the past been intrusted to a body of men who have been held to be best posted on the shooting merits of the individuals entered for this great event. The results of 1896 and 1897 are silent witnesses as to the capabilities of the handicap committee. In 1896 there was no straight score, but there were eight ties on 24 for the first eight moneys, and thirteen ties on 23 for the remaining six moneys. In 1897 there was but one straight score out of 135 shooters; nine men tied with 24, and divided the next nine moneys, each man getting \$188.45; there were eleven ties on 23, and they divided the next eleven moneys, each man drawing down \$99.50; thirteen men tied on 22, and got \$19.55 apiece.

Nothing more need be said regarding the handicapping, except to add that the same committee that served so acceptably last year will this year once more undertake the thankless task of trying to put each man on his proper mark.

The management of the shoot will as usual be under the control of our manager, Elmer E. Shaner, and he will attempt to carry our sixth annual Grand American Handicap to a successful conclusion on practically the same lines that he adopted in 1897. The experience gained in running that large shoot and in handling such an enormous number of shooters has been put to good use, and this year we fully expect the Grand American Handicap to run even more smoothly than any of its predecessors.

In deference to a very generally expressed wish we have this year decided to donate to the winner a handsome sterling silver trophy, one that will serve to remind him in the future of his success in the year of 1898 at the traps on the Elkwood Park grounds.

The division of the moneys has also been thoroughly and carefully considered, and we have decided to make a slight change in the same. Instead of guaranteeing \$1,000 to the three high guns—\$500, \$300 and \$200—we have determined to guarantee the sum of \$1,500 to the same three high guns, dividing it \$600, \$500 and \$400. The surplus will as heretofore be added to the purse. The surplus will be divided on the same plan that was adopted in 1896 and 1897; that is to say, it will be divided among the next high guns in such ratio as has seemed best. This method of dividing the moneys is fully set forth in another part of the programme, and need not be discussed any further. We are most thoroughly satisfied that this method of dividing the moneys has had a great deal to do with the popularity of the Grand American Handicap as the shooting event of the year; and we feel that the shooters themselves will uphold us in adhering to this system.

Every shooter will be known by his number on the shooting list. He will be provided with a tag giving his number and handicap distance, which will be affixed to his back. By this means everyone can see at a glance what number is at the score, and can thus readily tell when his turn to shoot will come, thus avoiding much unnecessary delay, and facilitating the quick shooting of the handicap. The referee can also by this method of numbering each shooter tell at a glance whether the shooter is at his right mark, thus saving much delay in referring to the shooting list.

In short, every preparation has been made to secure the easy and smooth running of the shoot, and we are willing to leave the verdict in this case to a jury of those who take part in this, our sixth annual Grand American Handicap.

Under the head of "Information relating to the Grand American Handicap exclusively" will be found the following items that are

Of Importance to Shooters.

The manner of shooting the Grand American Handicap this year (and in fact all events scheduled for the tournament) is as follows: Shooters will be called to the score in turn, shooting their first bird at No. 1 set of traps; as soon as a shooter has shot at his first bird, he passes on to No. 2 set and shoots at his second bird on that set; he then shoots at another bird at No. 3 set and passes into the building through the right wing, waiting until it is time for him to go out and shoot at his fourth, fifth and sixth birds; and so on.

A contestant missing 5 birds must drop out, with the privilege of re-entering in case he has a chance to win any portion of the purse. To facilitate shooting, and to prevent delays at Nos. 2 and 3 sets of traps, a shooter who happens to score his fifth miss on either No. 1 or No. 2 set of traps must finish that round of 3 birds, irrespective of the fact of his having 5 misses to his credit.

Every shooter will be numbered, each entry being known by his number when called to the score. A small tag will be affixed to each shooter's back, giving his number on the shooting list, and also his handicap in yards. This will enable the referee to see at a glance if the shooter is at his right mark, and will also enable shooters, spectators and scorers to tell who is at the score by merely referring to the list of entries numbered in shooting order. Each contestant must supply himself with five "no-bird" tickets.

In case the Grand American Handicap entries are so numerous that it is impossible to finish in good light on March 23, the referees shall stop the shooting at any time they may deem it necessary; in this case the shooting will commence at 10 o'clock sharp Thursday, March 24.

Positively no entry will be taken, nor shooting up allowed, after the last man has shot at his second bird.

The Interstate Association reserves the right to refuse any entry.

Conveyances will meet trains at the Elkwood Park stopping place and carry shooters to the club house, charging ten cents. Shooters are requested to inquire what the fare will be before riding in the conveyances. This is necessary to avoid being imposed upon by unprincipled parties.

Guns Weighed.

Contestants are requested to make sure that their guns are not over 8lbs. in weight, as all guns will be weighed at the score.

Every shooter will be furnished with a key to a locker upon payment of 50 cents, the 50 cents being refunded to him on return of the key. This charge is made simply to insure that the key will not be carried off, thus necessitating a new lock. Each of these lockers is amply sufficient to accommodate the belongings of two shooters, and no two lockers have the same key—all Yale locks. As there are two keys to each locker, the accommodation in this respect will be ample for at least 150 shooters.

It is requested that entries for the Grand American Handicap be made in ample time to permit the sending of receipt and admission badge, and for same to reach the maker of the entry prior to his departure for Elkwood Park. Should entries be received so late that it will be impossible to reach the maker of the entry by mail until after Saturday, March 19, receipt and admission badge will not be sent. Therefore shooters who make late entry, and do not receive receipt and admission badge, will be required to pay 50 cents admission to Elkwood Park, which will be refunded on calling at the cashier's office and applying for receipt, admission badge and rebate ticket covering the amount paid at the gate. All entries made must be accompanied by the maker's full name and address, which will be withheld from publication if desired and "shooting name" only used.

Under the head of "Rules" we note that as usual the Interstate Association's rules (Hurlingham revised) will govern all points not otherwise provided for in the programme. No guns larger than 12-gauge allowed, and no gun to weigh more than 8lbs.

In order to expedite the shooting, a contestant missing 3 birds in any event, except the Grand American Handicap, must drop out, with the privilege of re-entering in case he has a chance to win any portion of the purse. In the Grand American Handicap it will be 5 misses out, with the same privilege.

Rule 13 of the Interstate rules, relating to the time limit for gathering a bird, and Rule 19, which permits a man to gather his own bird, or to send a man for it, have been abolished. All

birds will be retrieved by dogs, the dog being released the moment the bird touches the ground.

All ties that are shot off will be miss-and-out, and the original distances contestants stand at will govern.

Handicap Committee.

Messrs. Jacob Pentz, of Shooting and Fishing; Edward Banks, of FOREST AND STREAM; W. K. Park, of Sporting Life, and Elmer E. Shaner have been appointed a handicapping committee, and will handicap all contestants from 25 to 33yds. Half yards will be given wherever such course is deemed advisable.

In order to place all contestants on an equal footing, handicaps will not be announced until the evening of March 19, the day on which the committee meets.

High Guns in all the Events.

In all the events set for March 22-24 the purses will be divided among the high guns; there will be no class shooting. The number of moneys in the purses for the 15-bird events and for the Grand American Handicap will be regulated by the number of entries. The method of dividing those purses is set forth at great length in the programme. In the 15-bird events there will be two moneys for every ten entries or fraction thereof up to 100 entries.

In the 10-bird events it will be high guns pure and simple, the total amount of the purse being divided into four moneys—40, 30, 20 and 10 per cent.

In the 7-bird events it will also be high guns pure and simple, the total amount of the purse being divided into three moneys—50, 30 and 20 per cent.

The Interstate Association guarantees \$1,500 in the main event—the Grand American Handicap—which will be divided among the three highest scores, as follows: \$600 to first high gun, \$500 to second high gun, and \$400 to third high gun. In addition to first money the winner of same will receive a sterling silver trophy, commemorative of the win, presented by the Interstate Association.

All Surplus Added.

All surplus over and above the \$1,500 will be added, and will be divided among the next high guns in proportion and in number as set forth in the programme. Provision is made for 170 entries, and it is worthy of note that if there are 170 entries (there were 146 last year) there will be money for the twenty-five high guns. Should there be more than 170 entries all surplus over and above \$4,250 (that is 170 entries at \$25 each) will be divided into ten equal parts, and added to the different amounts due the first ten high guns.

Briefly summarizing the foregoing—that is, the method of dividing the purse—it will be noted that the purse will be divided in accordance with the number of entries received; the three high guns receiving respectively \$600, \$500 and \$400. By this division two places are created for every ten entries over sixty. It is not possible for fourth money to exceed third, and the moneys would seem divided in such manner as to be just to all. For instance: If there are seventy entries, fourth gun would be entitled to \$150, while fifth gun would receive \$100. If 100 entries, fourth gun would receive \$250, and the eleventh gun \$50. If 146 entries (the number last year), fourth gun would get \$322.50, and the twenty-first gun \$43.

First Day's Programme.

Elkwood Park Introductory.—Seven birds, \$5 entrance, birds extra, 30yds. rise, three moneys, 50, 30 and 20 per cent., high guns, not class shooting. Ties in this event will not be shot off, and they must divide.

Nitro Powder Handicap.—Fifteen birds, \$10 entrance, birds extra, handicaps 25 to 33yds. The number of moneys into which the purse will be divided will be determined by the number of entries received, as is fully explained elsewhere in this programme. The handicaps contestants receive for the Grand American Handicap will govern in this event. High guns, not class shooting. The event cannot be carried over, and it must be finished the same day; therefore should the entries be so numerous that it will be impossible to finish by adhering to the "3 misses out," the Association reserves the right to change the rule for this event at any time it may be deemed necessary to do so, and drop all who have missed one or more birds.

Branchport Sweepstakes.—Ten birds, \$7 entrance, birds extra, 30yds. rise, four moneys—40, 30, 20 and 10 per cent. High guns, not class shooting.

Second Day's Programme.

For the second day the Grand American Handicap alone is scheduled. Its conditions are: 25 birds, \$25 entrance, birds extra, not class shooting, handicaps 25 to 33yds. rise, \$1,500 guaranteed by the Interstate Association, and all surplus added; \$600 and sterling silver trophy to first high gun, \$500 to second high gun, and \$400 to third high gun. All money in the purse in excess of the \$1,500 will be divided in accordance with the number of entries received.

Third Day's Programme.

The Grand American Handicap if not finished on the previous day.

Consolation Handicap.—Fifteen birds, \$10 entrance, birds extra, handicaps 25 to 33yds. The number of moneys into which the purse will be divided will be determined by the number of entries received, as is fully explained elsewhere in this programme. Winners of money in the Grand American Handicap will have 1yd. added to their handicap. High guns, not class shooting.

Auld Lang Syne Sweepstakes.—Ten birds, \$7 entrance, birds extra, 30yds. rise, four moneys—40, 30, 20 and 10 per cent. High guns, not class shooting.

Miss-and-Out.—Time permitting, miss-and-out events will be arranged to suit the shooters.

Entries for the Grand American Handicap.

Regular entries must be made on or before March 17, 1898, and must be accompanied by \$10 forfeit. The remaining \$15 may be paid up to the time the last man fires at his second bird. Penalty entries may be made after March 17, up to the time the last man fires at his second bird, by paying \$35.

Entries will be received at the New York office, John L. Lequin, secretary-treasurer, 4448 Cedar street, P. O. Box 605, New York, N. Y.

Trap Around Pittsburg.

Hazelwood Gun Club.

PITTSBURG, Pa., Jan. 28.—J. M. Crossland, J. O'H. Denny and Sandy McPherson shot a 50-bird race to-day, Crossland winning from Denny after a very close race by 1 bird, Denny's 50th getting away from him. McPherson was out of form, and could only account for 40 out of his 50. In the 25-bird sweep that followed the match, Walter took first money alone on 25 straight. Crossland with 24 and Wilbert with 23 were respectively second and third. Scores:

Three-cornered match, 50 live birds per man:
Denny 2212202221221222122222222—24

IN NEW JERSEY.

Somerville Gun Club.

Jan. 25.—The Somerville Gun Club had a field day to-day. One of the events was a fox chase after a red fox captured within two miles of the club house by E. C. Hoyt. The fox was started about 2 P. M., and was given 15 minutes' start of the hounds, eight of whom were turned down on his track. After a two hours' chase he was caught by two hounds belonging to Mr. Fleming, of Foxhill, N. J.

A 32lb. turkey was also shot for at the dead mark, 40yds. from the scores, forty chances being taken at 25 cents a piece. The turkey was won by Neaf Appgar, of Somerville, N. J., who put three shots in the block, one of the pellets being exactly in the center. He used 2½drs. King's Smokeless and 1½oz. shot.

A race at 5 live birds per man, \$3 entrance, was also decided. First money in this event was won by Marcus Hoyt, a boy of fourteen years of age, who killed 5 corks in excellent style. The scores were: Marcus Hoyt 5, J. Aldgair, Jr., F. Mount and Bellis 4, J. H. Aldgair, Sr., and G. Dunster 3.

In a race at 10 targets each, \$1 entrance, two moneys, scores were: C. Bird, G. Messenger, G. Dunster and C. N. Appgar 5, F. Mount and C. Schaefer 4, J. H. Aldgair, Sr., 3.

GEO. W. SQUIER.

East Side Gun Club.

Jan. 27.—A live-bird shoot was held to-day by the East Side Gun Club, of Newark, N. J., on the Ferry street grounds. Fairmount shot a race with Stevens, of New Brunswick, and lost it by losing his last bird, the scores standing 23 to 22. In the 7-bird race O'Connell, Stevens and Woodruff divided first money with 7 straight. There were twenty-three entries in this event. Fifteen entries were obtained in a miss-and-out, the pot being divided on the 9th round between Koegel, Fairmount, Hassinger and Shaw. Scores were:

Fairmount vs. Stevens, 25 birds, \$25 a side, loser to pay for the birds:

Stevens 221222222222222222122122122122—23
Fairmount 1222120210222212221212220—22

Sweeps were shot as below, No. 1 being at 7 birds, No. 2 a miss-and-out:

	No. 1.	No. 2.
Koegel	1011222—6	111122112
Waldman	2012221—6	
Reiboldt	0122111—6	2122220

Boiling Springs Gun Club.

Feb. 2.—The semi-monthly prize shoot of the Boiling Springs Gun Club was held this afternoon. The attendance was quite small, but this unquestionably was due to the extremely cold weather that prevailed. There was any quantity of snow on the ground, and the sun shone bright and clear; there was a glare from the snow that was almost blinding, and that rendered steady shooting out of the question.

Up to date there have been three contests for the first gold watch donated by the club for these semi-monthly prize contests. One watch is shot off every two months, there being thus four shoots in all for each watch. Two out of the three shoots held this year have been won by Capt. Money, who broke 50 out of 57 on Jan. 5, and 49 out of 57 on Jan. 19. To-day's contest was won by the president of the club, E. A. Jeanneret, who broke 51 out of 70 shot at, scoring 36 out of his first 50, and accounting for 15 out of his allowance of 20 extras. Chris Wright was second with 49 out of 57, Capt. Money being close up with 48 out of 53, breaking 45 out of his first 50, and then breaking his allowance of 3. Handicaps are changed every month; hence Capt. Money's cut in his handicap from 7 down to 3, a very severe cut indeed, but one that doesn't seem to bother him very much, as he is shooting better than ever. The scores in this event are given below in detail:

Fifty targets, unknown angles, handicap allowances, Sergeant system:

Jeanneret, 20.111011011110111100110011111011110011110001—36
111111000101111110
Wright, 7 111111000101111101111101110011111101111—43
0111111
Money, 3 11111110111111111111111101110110111111—45
111
E Banks, 2 11111110111101111101101111111111111111—44
G Greiff, 6 11111110010111101111110110110110110011111—40
Spiegel, 20 10011101100111110000011110110111001101100111—33
0011101010w
C Wise, 7 111110011001010101000001101101111111011011—34
Nelson, 14 01111001011010010001011011111000101011101011—32

Banks, Greiff, Wise and Nelson did not shoot off their allowances.

Eight sweeps were also shot during the afternoon, seven of them being at 10 targets and the other at 25 targets. All targets are thrown at unknown angles, Sergeant system, a method that makes the shooting on these grounds very hard, the screen being high and the targets thrown at very acute angles. Scores in the sweeps were:

Events: 1 2 3 4 5 6 7 8
Targets: 10 10 10 10 10 10 10 25

Banks 9 7 9 8 6 8 9 21
Wright 5 8 8 7 9 6 8 19
Nelson 7 6 8 6 8 8 9 17
Greiff 8 6 9 10 9 7 9 ..
Money 8 4 8 7 6 10 8 24
S-egel 3 8 5 .. 5 7 15
Jeanneret 7 6 4 ..
Snyder 8 ..
Wise 6 9 9 ..
Van Dyke 9 9 ..
Hudson 4 6 ..
Heflich 8 4 ..
Thourot 8 3 ..
Coman 6 ..

As a finisher, Capt. Money, Banks and Wright shot a three-cornered race in the gloaming, the conditions being 25 targets per man. As usual, Capt. Money came out ahead, this half light being something that seems to specially suit him. The scores in this event were: Money 22, Banks 21, Wright 13. It is only fair to Wright to state that he was shooting what he termed "culls."

Feb. 5.—The regular monthly club shoot of the Boiling Springs Gun Club was held this afternoon. There was a good attendance of members, while a few friends of the club also put in their appearance. Among the latter were Ed Taylor, of the Lafin & Rand Powder Company; B. Waters, of FOREST AND STREAM, and Messrs. Colquitt and Frank Butler.

The day was not a bad one for shooting, although a slight drizzle at times made it rather uncomfortable for those at the score. The main event was of course the club handicap, 50 targets, unknown angles, Sergeant system. In this event H. Nelson and J. Dutcher both made possibles; Nelson was allowed 16 extras, but he broke 11 straight of his allowance and then withdrew with a total of 50 out of 61 shot at. Dutcher, on the other hand, had a hard row to hoe, requiring 17 out of his allowance of 20 to make a possible; he hoed the row, however, losing only 2d, 14th and 15th targets. Next to them came Platt Adams (10), who broke 22 out of his first 25. Scores in detail follow:

Club shoot, handicap, 50 targets, unknown angles, Sergeant system:

EDWARD BANKS.

Elizabeth Gun Club.

Feb. 2.—A live-bird shoot was held to-day on the grounds of the Elizabeth Gun Club, under the management of Eddie Earle. It was hard shooting, a strong northwest wind blowing across the traps, and the glare of the bright sun on the snow making a very blinding light to kill birds in. There was only a small crowd of shooters on hand. Among the number were: J. L. Brewer, of New York; F. Coleman, Mahanoy City, Pa.; W. Terry, of Plainfield, N. J.; Henry Koegel, of Newark, N. J., etc.

One of the most interesting events of the day was a 25-bird race between W. Terry and Blodgett, the latter hailing from Elizabeth. The stakes were \$25 a side, loser to pay for the birds. The birds were slow to start, a very few leaving the traps when they were pulled. Terry lost by one bird, scoring 20 against 21. Below are the scores in the various events decided to-day:

No. 1. No. 2. No. 3.
J L Brewer, 32.....21222—5 2221102 6 222212222220220—13
F Coleman, 30.....21221—5 2022222 6 22122202210202—12

GEO. W. SQUIER.

ON LONG ISLAND.

Brooklyn Gun Club's Invitation Shoot.

Feb. 3.—Blessed with good weather—that is, good winter weather—John Wright's first attempt at an invitation live-bird shoot, on behalf of the Brooklyn Gun Club, was every bit as successful as we had anticipated. Thirty shooters took part in the different events decided, being a fair representation of those live-bird shooters around New York who are very seldom seen at a tournament of a similar kind. Ordinarily the scrub shot has little show to break even; but the programme for this shoot seemed to hold out hopes that even the poorest shot, with a little luck, might be able to have a day's shooting at pigeons without its costing him much more than "the rice of the birds."

We have said that the weather was good winter weather. The sun shone brightly, and the wind blew briskly from the west; the thermometer showed signs of life by hovering in the neighborhood of 10 to 12 degrees above zero, and there was enough snow covering the surface of Dexter Park to create a glare that was blinding when, as often happened, a white bird left the traps and made for Jamaica. It was in fact biting cold weather to stand about in, and even Billy Mills, the trapper, and his assistant found it hard work to keep warm. Somewhere in the neighborhood of 600 birds, including "no birds" and "bye birds," were trapped during the day, quite a creditable showing for a winter's day.

A glance at the scores will tell who was on hand to shoot, so nothing further need be said on that score. John S. Wright, assisted by Secretary Baron and Joseph Swan, both members of the Brooklyn Gun Club, kept things going in a lively fashion. The need of two sets of traps was sorely felt, the waits between shots being long and tedious in the cold weather. John D. Regan was in the scorer's box, keeping tab on kills, misses, no birds and bye birds. The programme was too lengthy for such a gathering of shooters, and the Union Course Handicap, 15 birds per man, was cut off. The scores in all the events are given below; the last one, No. 5, was the Brooklyn Handicap. In this event, which was at 10 birds, \$7.50, birds extra, four moneys, there was a handicap in allowances as well as in distance. The 28yds. men were allowed a miss as a no bird; 27yds. men a miss as a kill; 26yds. men a miss as a kill and a miss as a no bird. Under these conditions it was no wonder that all of the twenty entries save two drew down money. There were seven 10s, six 9s, four 8s and only one 7. Harding made 6, but Baker withdrew after losing four out of his first five birds.

Of the straights, Billings and Lott, both 26yds. men, and Money and Quimby, both 29yds. men, killed their 10 birds without an error. Welles, 28yds., used his allowance of a miss as a no bird in the 4th round; Swan, 26yds., and Saunders, 26yds., both used their allowances, Swan in the 5th and 6th rounds, Saunders in the 5th and 7th rounds.

Hallowell at 30yds. scored 9 out of 10, losing his second bird dead out of bounds, after missing it on the ground with his first barrel, holding his second so long that the bird, a left-quartering incomer, fell dead out of bounds. Schlieman, Hudson and Fairmount, all 28yds. men, used their allowances of a miss as a no bird in the 4th, 6th and 7th rounds respectively, Schlieman failing to account for his allowance bird. Kitching, 26yds., with a miss as a kill, used up his allowance in the 4th round. Bissett, 26yds., took his allowance of a miss as a kill in the 3d round, and then failed to do anything with his miss as a no bird in the 5th round.

Of the four 8s, Dr. W. Wynn, 29yds., had no allowance. Henry, 28yds., took his allowance in the 4th round, but failed to do anything with it. Langcake used his allowances as a 26yds. man in the 3d and 7th rounds, and Packard, another 26yds. man, took his allowances in the 3d and 5th rounds; neither Langcake nor Packard were able to account for their no birds. F. A. Thompson, the lucky 7, made good his straight in the 2d round, but failed on his 4th, 6th and 10th birds.

The beauties of the old system of class shooting are well shown in this event. As we figure the purse, there were twenty entries at \$7.50, birds included at 25 cents each; this leaves \$5 net for the purse from each entry, or a total purse of \$100. Four moneys; that is, \$40, \$30, \$20 and \$10. The straights received about \$5.70 for their good shooting; the six 9s and the four 8s each got back their \$5 and were out just the price of the birds; the lucky 7 got \$2.50 more than he put in.

The scores in all the events were as below:

No. 1. No. 2. No. 3. No. 4. No. 5.

Jos Swan, 26.....2222122222—10
Schlieman, 28.....210112211—9

In the above table No. 1 was a \$2 miss-and-out, re-entry in the first round. In this event Van Allen, Baker and Blauvelt all re-entered after losing their first birds, the result of such re-entry being shown in the score.

No. 2 was 5 birds, \$3, birds included, three moneys. No. 3 was 5 birds, \$5, birds included, four moneys. No. 4 was 7 birds, \$5, birds extra, four moneys. In Nos. 1, 2 and 3 all stood at 28yds., but in Nos. 4 and 5 each man stood at the mark shown in the scores.

EDWARD BANKS.

New Utrecht Gun Club.

Feb. 5.—There was only a fair attendance this afternoon at the Dyker Meadow grounds of the New Utrecht Gun Club. Gaughen won in Class A, and Fleet in Class C in the club shoot. In the prize gun shoot Van Brunt and Gaughen tied, the shoot-off being postponed until the next shoot. Van Brunt won the merchandise prize in No. 3. Scores:

Club shoot: J. Gaughen, A, 19; D. C. Bennett, A, 18; F. A. Thompson, A, 15; C. C. Fleet, C, 13.

Prize gun shoot: M. Van Brunt 21, J. Gaughen 21, F. A. Thompson 20, D. C. Bennett 17, C. C. Fleet 13, F. A. Hegeman 9.

Merchandise prize shoot, 9 singles and 3 pairs: Shoot-off.

E. G. FROST, Sec'y.

The Pennsylvania State Shoot.

Hints on the Contents of the Programme.

READING, Pa., Feb. 1.—The committee of twelve of the Independent Gun Club, of which John Shaaber is the chairman, is rapidly going ahead with the preparations for the annual meeting and shoot of the Pennsylvania State Sportsmen's Association, which commences Tuesday, March 29, and lasts for four days.

On the first nights the yearly business of the State Association will be considered at the club house. The committee of arrangements meets every Tuesday and Friday evenings. The scene of the tournament will be on the club's grounds at the Three-Mile House, Shillington, near Reading. The programme is rapidly taking shape, and will be ready for distribution in about two weeks. Copies will be mailed to prominent shooters all over the country.

The supplemental matter of the programme has all been formulated. It consists of a history of Reading, the State officers, the charter, the constitution and by-laws, the game laws and the magatrap rules, which will govern the shoot, together with advertisements of well-known business men. All this will be combined in a neat little volume about 4x2in., with red leather cover bearing a frontispiece. An official badge has just been adopted. It consists of a large button, on which is a colored picture of a camp in the woods with a camper's outfit. Attached to it are two red ribbons suitably inscribed in gold.

A few of the features of the programme can be given. The first three days will be given up to target shooting, and the events on those days will consist of eight State and six open. The events will vary from 15 to 25 targets. Friday will be live-bird day. The events for this day have not fully been decided upon. The great feature of this tournament will be the contests for the trophies, the six principal ones and a number of minor character. The following will be the trophy events and conditions:

No. 1, the Wm. Wolstencroft Son's trophy for the individual championship of Pennsylvania at targets: Keystone rules to govern; 10-gauge guns 18yds. rise; 12-gauge guns 16yds. rise; rapid-firing system, entrance money divided as follows: First, 25 per cent. of the purse and trophy; second, 40 per cent.; third, 20 per cent.; fourth, 15 per cent.. The medal is of a very handsome design, and is valued at \$100. Each contestant will shoot at 50 single targets, entrance \$3.

No. 2, Reading team trophy: For five-men team championship of Pennsylvania. Prize, a silver trophy valued at \$200, donated by the Reading Shooting Association. Conditions: Teams shall consist of five bona fide members of any club or association in the State Association. An entrance fee of \$10 will be charged each team, one-half of which shall be in payment of targets, the balance 50 per cent. to the holders of the trophy; the balance 30 and 20 per cent. to the next teams in order, 25 targets per man, 125 per team, known angles, rapid-firing system, 10 and 12-gauge guns, 16yds. rise, no man to shoot on more than one team.

No. 3, for six men team championship of Pennsylvania. Prize, silver trophy valued at \$200, donated by the Harrisburg Shooting Association. Teams will consist of bona fide members of any club or association in State Association. An entrance fee of \$10 will be charged each club, one-half of which shall be in payment of targets, the balance 50 per cent. to holders of trophy, the balance 30 and 20 per cent. to the next teams in order, 25 targets per man, 150 per team, known angles, rapid-firing system, 10 and 12-gauge guns 16yds. rise. No man to shoot on more than one team.

No. 4, E. C. Powder Company's championship cup event, 100 empire targets, shot in two events of 50 targets each, unknown angles, entrance \$3, with an optional sweepstake of \$2 additional entrance, handicap from 100 to 120 targets. There is \$30 added to this trophy. This trophy and 20 per cent. of purse to winner, 35 per cent. to second, 20 per cent. to third, 15 per cent. to fourth, 10 per cent. to fifth.

No. 5, American Wood Powder Company's trophy: Prize, silver prize, for teams of three men each, no man to shoot on more than one team, and all must be members of one club, 25 singles and 5 pairs. The prize and 40 per cent. to the team making highest score, 30 per cent. to second, 20 per cent. to third, 10 per cent. to fourth.

No. 6, Williamsport trophy, for the individual championship at live birds. Prize, a diamond badge valued at \$250, presented by the citizens of Williamsport, Pa. Each contestant must be a bona fide member of a club or association or an individual member. First prize, the diamond badge to person making the highest score; the three next highest scores to receive 50, 30 and 20 per cent. respectively. The winner of the badge this year receives 40 per cent. of entrance money next year, the balance to be awarded as above. Each contestant to shoot at 15 live birds, American Association rules, with the exception of 1½oz. shot allowed 12-bore guns.

These special trophy events will be sandwiched in with the regular events.

The State shoot was held in Reading once before several years ago. The State Association has done a great deal for the betterment and protection of the sportsmen's interests. The present officers are: President, J. O'H. Denny; Vice-President, Harry Thurman; Treasurer, James Wolstencroft; Secretary, J. A. Wilson; Corresponding Secretary, Edward Yeager. Board of Directors: G. F. Nesbitt, H. M. Worden, W. H. Wolstencroft, E. E. Shaner, J. A. Shaaber, W. H. Burnham.

To all events on the programme money will be added, but the total amount has not yet been decided upon.

ARTHUR A. FINKE.

J. H. Cameron, of the Winchester Repeating Arms Company, has returned to the city from a business trip into Canada. He reports the Hamilton shoot as a good one, and was full of the showing made by the Americans present. We can hear nothing of Mr. Cameron's fellow laborer, J. Hildreth, who is so high-toned just now, being down South among the fashionable folks, that he quite neglects some of his friends who are now doing their best to preserve their equilibrium on the icy sidewalks of Greater New York.

For More Varied Styles of Shooting.

WHEN the tournament committee of the Interstate Association recommended at a general meeting of the Association that clubs holding tournaments under the auspices of the Association should be urged to vary their programmes, it took a big stride in the right direction. We have always held that the rapid-firing system, known or unknown angles, was too mechanical and too monotonous; there is something artificial about target shooting anyway, and we felt that something ought to be done to make it conform as nearly as possible to field shooting, accustoming a man to keep his eyes open and his head clear and cool.

The two styles of shooting that in our opinion come the nearest to perfection in this respect are (1) expert rules, 5 unknown traps, known (or unknown) angles, one man up, the five traps to be emptied before retiring; (2) the Novelty rule, a system that calls for 8 unknown traps, regular angles, rapid-firing system. The recommendation of the tournament committee specially mentioned the above two styles of shooting, and we trust that the clubs under whose auspices the Interstate Association holds its tournaments this season will see fit to adopt the recommendation and include a few events at these styles of shooting on each day of its tournament.

Business before Pleasure.

Expert rules, one man up, is "the way we used to shoot," as old-timers would say. And that's a fact. It's a fact also that there was just as much fun at the old-time shoots, and more sociability, than there is nowadays at an up-to-date tournament, all unknown angles, rapid-fire, where the club is trying to see how many targets it can throw in a day, and where each shooter is apparently trying to see how many shells he can get rid of, and how much money he is "ahead of the game."

Sociability has but a slight show at modern tournaments. You've no time for "visiting," and conversation on a business basis is out of the question, if the squad hustler is properly posted and acts up to his title. The daily programme calls for 170 targets, \$17 entrance for all day, and by the time night comes, what with extras, you've fired 200 shells away and are as tired as a dog that's been out hunting all day. You're in no mood for a business talk, and even "social intercourse" (something that's generally mentioned in article 2 of every gun club's constitution) becomes a bore. A supper, a smoke and your bed is about all you want, as you must get fit for to-morrow's siege at the traps. The above is our view of the modern tournament, and we have been present at very many of late years. If our view is incorrect, we shall be only too happy to own up if the majority is against us.

Unknown Angles are Monotonous.

Again, take unknown angles. Why is it that there are so few spectators at target tournaments? Answering that query by putting another, we would say: "Is there anything much more monotonous than to watch squad after squad going to the score and breaking 85 to 95 per cent. of targets thrown at that style of shooting?" Every spectator who can handle a gun at all, and even the veriest novice, watches for a while and then sits down or goes away. We all know how easy it looks to break them all when it is not ourselves who are handling the guns. There goes the target, and it's dead easy. Once seen, no one, except those bitten with the fever, cares to come again and look on.

Take the shooters themselves. How many of them ("the regulars" are here referred to) sit and watch squad after squad breaking the targets? All they do is to inquire after a squad has finished: "How many straights in that squad?" That's the interest nowadays. But let an event be under "expert rules, one man up," how different!

In this connection let us refer to the tournament of the Baltimore Shooting Association, held last October. On the afternoon of the last day for target shooting it was raining quite hard, and was fast growing dark, yet all the shooters entered an expert rule race as an extra, and also shot a race at traps pulled in reverse order. More interest was excited by these two events than by all the unknown-angle events shot during the day. Experts, semi-experts and novices, all gathered under the roof that covered the score and watched each man go up to the score, stand in front of No. 3 trap, and pound away at the 5 targets dealt out to him by the indicator. And when it came to "reversed order" there was just the same interest taken in the shooting.

The Novelty Rule was Popular.

Going back to the novelty rule. Five years ago the Interstate Association introduced this rule at its tournaments, and it became quite popular. It was a sporting style of shooting, and therefore it suited the shooters, and was approved by the spectators. But gun clubs soon began to frown on it; you couldn't throw as many targets in one day under that style of shooting as under the ordinary unknown-angle system. Fewer targets per day meant just so much less money in the treasury, and therefore the novelty rule was finally tabooed.

The conditions under which it was shot were also popular. Experts were handicapped at 18yds.; semi-experts at 16yds., and novices were moved up to 14yds. Behind the screen were the five traps set in regular order. Out in the field, 85yds. from the screen, were three smaller screens, one in front of No. 1 trap, another in front of No. 3 and the third in front of No. 5 trap. The one in front of No. 1 trap threw a right-quartering in-comer; the one in front of No. 3 a left-quartering in-comer, while the one in front of No. 5 threw a direct in-comer. Thus there were eight unknown traps, and you were liable to get any one of them. With Ben O. Bush's pull, specially designed for this style of shooting, there was no telling whether you were going to get a "pudding"—that is, an in-comer—or a "corker"—that is, No. 1 when you were in front of No. 5. How severe this style of shooting was at first may be gathered from the fact that at the Altoona, Pa., Gun Club's first annual tournament at Wopsononock, there were only two "10 straights" made on the first day. A novice made one, and W. M. C. Jones, of Pittsburg, Pa., a semi-expert, made the other!

The Clubs want to throw Targets.

The cause of the apparent loss of popularity of both the above styles of shooting was solely due to the desire of clubs and club managers to throw lots of targets and thus help out the treasury. The wish to attract large attendance by means of big sums of added money had a great deal to do with it. And mayhap the ammunition and target manufacturing concerns were not unwilling that many targets should be thrown and consequently much ammunition burned up. The move therefore on the part of the Interstate Association, a body composed solely of manufacturers and of dealers in just the very articles used at tournaments, is decidedly significant. The Association wants to popularize trap-shooting, and it realizes that a varied programme will do it when nothing else can.

The other move of the Association—that of barring out itself and its employees from taking part in the divisions of the monies at these tournaments—was a very thoughtful one, and is directly in line with that which recommends a varied programme. At the coming Interstate tournaments the rank and file will be on an equality when it comes to expert rule and novelty rule events, while the experts themselves, the men who have or who may have had experience at these styles of shooting, are barred from competing against those who have had no such previous experience.

The review of the Interstate Association's season for 1898 will be of much additional interest when it is published next fall. Its figures will be scanned with a great deal of care, for we believe that from these figures much can be deduced that will foretell the future of trap-shooting. The Association is trying one experiment—that of barring the trade—and is anxious that the clubs under whose auspices it purposes holding tournaments this season shall try another: that of varying the programme by introducing events at expert rules and under the novelty rule. It now remains for the clubs to decide whether they will help the Association or not.

A Compass in a Gun Stock.

DUNDEE, Ont., Jan. 28.—One day recently I was out in a large swamp and a very heavy snowstorm commenced. I had to look at my compass very frequently, and of course each time I had to stop and take it out of my pocket. This was losing time, and in addition my hands were very cold. I thought then that it would be a good plan to have it fixed in the stock; it would always be with a man when he wanted it, and would be easily seen. If the idea is worth anything you might give it publicity in your paper.

(Note.—A compass could be readily fixed in the stock of any gun, and if countersunk would scarcely be liable to injury by breakage of the glass. With a rubber butt plate, the compass could be placed on the outside of the stock near that butt without any danger of attraction from the metal of the locks or barrel.—Ed.)

W. F. MOORE.

Trap Around Buffalo.

Audubon Gun Club.

BUFFALO, N. Y., Jan. 29.—Below are the scores made to-day by members of the Audubon Gun Club at the club's regular weekly shoot. Event No. 3 was the regular club badge shoot; in this event H. C. Heindol won in Class A, George Zoeller in Class B, and Dr. Fred Sauer in Class C. No. 4 was the shoot for the monthly cup. In this event B. Talsma won with 25 out of 28, this event being a handicap. No. 5 was at 5 pairs. Scores:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	15	15	25	25	10	15	Targets:	15	15	25	25	10	15

Bison Gun Club.

Feb. 3.—Considering the blizzard which was raging to-day, in East Buffalo, there were some remarkably good scores made at the regular weekly shoot of the Bison Gun Club, Walden avenue and City Line. In the badge shoot Bauman and Mack tied in Class A; Saleman won in Class B, and Schreier in Class C.

On Thursday, Feb. 10, there will be an all-day shoot at sparrows and targets, shooting beginning at 10 A. M. sharp.

To-day's scores were:

Events:	1	2	Events:	1	2
Targets:	10	25	Targets:	10	25
Bauman	8	17	Mack	7	18
Danser	7	16	Saleman	9	19
E C Burkhardt	7	16	Schreier	6	13
Cooper	8	15			
Fifteen sparrows, 25yds. rise:

E C B	11012102210212—12		Cooper	0211210210121021—12	
Saleman	011221121221201—13				

MACK, Sec'y.

Boston Gun Club.

BOSTON, Mass., Feb. 2.—Boston's blizzard of Feb. 1 was too severe to admit of much trap-shooting on the day following. With trains late, wires down, business interrupted and everything at sixes and sevens, people had but little time to devote to sport. A few of the regulars, however, put in an appearance to-day at Wellington and negotiated the different events regardless of several drawbacks. The weather was very cold, and a 10-target event was quite sufficient to make one duly appreciative of the warm club house. Events as follows:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	6	10	5	6	10	10	10	10
Eastman, 16.....	7	9	2	8	5	3	9	8	10	10
Tait, 16	8	9	2	7	5	3	8	8	5	4
Miskay, 18	8	7	3	6	2	5	10	7	..	6
Winters, 18	4	4	4	6	5	3	10	9	10	8
Wildman, 16	8	6
Horace, 16.....	7	2	8	4	4	9	6	5
Whiting, 15	4

Events 1, 2, 4 and 7 known angles; 9 and 10 same, with use of both barrels; 5 and 8 unknown; 3 and 6 pairs.

Merchandise match, 21 targets, 10 known, 5 unknown, and 3 pairs, distance handicap:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	6	10	5	6	10	10	10	10

BOSTON.

The Amateur Championship at Carteret.

THE amateur championship, held under the auspices of the Larchmont Y. C. in past years, will this year be held at the Carteret Club's grounds, Garden City, L. I., Feb. 22-23.

The conditions of this contest are: 100 birds, entrance \$100, post entrance \$125, moneys to be divided 40, 25, 15, 10 per cent., and 10 per cent. to the club, all shooters to stand at 30yds. On each day each contestant will be allowed one bye bird. In case there be fourteen or more entries the following rules shall apply:

1. The shooter who misses 10 birds by the time the 50th round is finished, and thereby becomes tenth in place or lower, shall drop out without privilege of re-entry.
2. The shooter who misses 16 birds by the time the 75th round is finished, and thereby becomes eighth in place or lower, shall drop out without privilege of re-entry.
3. From the 75th round up to the finish, the referee shall retire (with privilege) those shooters who in his opinion have no chance of sharing in the moneys.

The Clarence H. Mackay cup, value \$200, will be presented by the club to the winner of the championship. Entries to be sent on or before Feb. 14, each to be accompanied by \$25 forfeit money, to Walter H. Mead, secretary of the Carteret Gun Club, 67 Wall street, New York. The executive committee of the club reserves to itself the right of refusing entries.

Cobweb Gun Club.

NEW YORK, Feb. 3.—Daniel Brady and Charles Zorn tied to-day in both the events shot at the Baychester grounds, this being the regular monthly shoot of the Cobweb Gun Club. Event No. 2 was a 10-bird match; No. 1 was the club shoot and Pentz medal match combined. The conditions of this contest are: All to stand at 30yds. rise, entrance fee \$10, open to all members of the Cobweb Gun Club only:

	No. 1.	No. 2.
D Brady	2*1221222—9	001212121—8

H. J. SCONCE.

H. J. SCONCE.

Sumpter and Clements for the Arkansas Championship.

PINE BLUFF, Ark., Jan. 27.—John J. Sumpter, Jr., of Hot Springs, and Geo. Clements, of Pine Bluff, shot a 50-target race here to-day for the diamond watch charm emblematic of the individual championship of the State at targets. The targets were blue-rocks thrown from a magautrap, and neither of the shooters could locate them to any extent until Sumpter hit his gait in the shoot-off. Scores were:

Clements	1011111111110101011010100011111111110011111—39
Sumpter	1111001010100111111111011010101011111110111—39
Shoot-off:	
Clements	110111111111110111111100110—20
Sumpter	11111111111111111111110111—21

L. J.

The Effectiveness of Small Charges.

IN recent issues of the London Field there have appeared some articles and communications on the effectiveness of small charges. One of these letters reads as follows: "Apropos of guns and loads, I believe if Sir F. Milbank was asked what charge he used when he killed 364 brace of grouse in one day, and 85 brace in one drive, he would tell you 2½ drs. ¾ oz. in a 12."

Acting on the above suggestion, the editor of the London Field wrote to Sir Frederick Milbank, receiving the following interesting reply:

"Your correspondent is quite right as to the charge I shot with on that memorable day's grouse shooting at Wemmergill Moor, Aug. 20, 1872, viz., 2½ drs. black powder and ¾ oz. of No. 6 shot. My three guns were 12-bore pinfire, by Westley-Richards.

"All the three guns I used in the great drive, in which I killed 95 brace of grouse, were so hot that on laying two of them down on a mossy wet bank close to the 'stand,' it made it 'smoke.' It must, however, be remembered that the drive lasted only twenty-three minutes. It may be asked how I know this? It was in this way: At the very first shot I had, the hammer of my gun caught the watch chain, which drew the watch out of my pocket, and I then saw the time; and after my last shot I purposely took the time, as I then knew what an extraordinary drive I had had. I think you will say it was sufficient to make guns hot! For the last five or six minutes I was obliged to shoot from the 'trigger guard,' owing to the heat of the barrels.

"I have to ask, would some of the new powders we read of have stood this heat without exploding? It may be the whole firing was so extraordinarily quick, from the first shot to the last, that there was no time for the heat to get through the cartridge case.

"Owing to the death (ten days ago) of my old keeper Joe Col-linson, who had been keeper in the Wemmergill Moors for a great number of years (and a better or more respected keeper never lived), some of our local papers, in reference to this great shoot in 1872, have been led into a few mistakes; and as the statement I now give has never been published, I am induced to give it to you, viz., during the season of 1872 myself and friends killed 17,074 grouse in forty-one days' driving. The number of shooters (as taken from my game book) averaged as near as possible five per day. The number of birds per day for each shooter was eighty-two. I think this is worthy of record as showing what a wonderful season 1872 was for grouse. It will be a very long time, I fear, before we see such another."

Trap at Hot Springs.

HOT SPRINGS, Ark., Jan. 25.—Inclosed herewith I hand you scores made to-day on live birds at Whittington Park, the contestants being Gov. John H. Tanner, Springfield, Ill.; Col. J. W. Gates, president Illinois Steel Co., Chicago; Col. J. L. Elwood, De Kalb, Ill.; Col. John A. Drake, secretary of Illinois & Indiana Railway Co., and Mr. Alfred Clifford, of Consolidated Steel and Wire Co., St. Louis. Mr. Chas. Macalister, of Baltimore, was referee, and John J. Sumpter, Jr., scorer.

The birds were all good strong flyers, and aided by the wind they were all more or less drivers, the wind blowing straight away from the shooter. Col. Gates, whose guests the other gentlemen are while in this city, undertook to stand at 31yds. and use one barrel, while Gov. Tanner, Col. Elwood and Drake stood at 21yds., and Mr. Clifford at 31yds., using both barrels. Each shot at 25 pigeons, low man to pay all expenses. Three tied for this honor, and the entire race is to be shot over again in a few days. Gov. Tanner and the rest of the party seemed to greatly enjoy pigeon shooting, and the Governor remarked that if he only had the time he would soon learn how to shoot well enough to give the regulars a hard race, and from the way he shot the first time out he should have little trouble in doing so. The scores:

Gov. Tanner, 21	22*10100020*011121000101—13
Gates, 31	110001010110100010*00101—10
Elwood, 21	002001221*1*0002100100100—10
Drake, 21	2221000100101010000021000—10
Clifford, 31	02021201011020000011*0211—13

SUMPTER.

Baltimore Shooting Association.

BALTIMORE, Md., Feb. 3.—By killing 15 straight to-day James R. Malone won the cup of the Baltimore Shooting Association for the third time. This makes a tie for the permanent possession of the cup with Charles Macalester. Both have won it three times during the past year. It was to become the permanent property of the man winning it the most times in twelve monthly shoots. Macalester and Malone will probably shoot a race for it. Macalester is now out of the city, but will return about March 1. Should he win it permanently, Malone will probably again donate it to the Association. Malone's winning yesterday was full of merit. Not only was he in it against some of the crack wing shots, but he stood at 31yds., which was the longest mark. The scores in the cup shoot were as follows:

Malone, 31yds., 15; Jamison, 29yds., 12; Collins, 28yds., 9; Sims 29yds., 11; Michael, 29yds., 8; Howel, 30yds., 9; Noah, 27yds., 8.

After the cup shoot Sims and Collins defeated Brewer and Michael in a 10-bird race, Sims and Collins scoring 15 to the 10 of the other pair. The individual scores in this event were: Brewer 4, Sims 9, Michael 6, Collins 6. There was also a lot of practice shooting.

GEO. L. HARRISON, Sec'y.

Answers to Correspondents.

No notice taken of anonymous communications.

M. C. D., Newark, N. J.—Who has an adjustable try-gun (as the English call it) in New York? Ans. Von Lengerke & Detmold, 318 Broadway, and J. P. Dannefeler, 9 Chambers street.

C. S. W., La Salle, Ill.—1. What is the best method for finding the trigger-pull of a rifle? 2. Are there any rifle clubs in Chicago that have shooting matches similar to the one held in Madison Square Garden by the Sportsmen's Association? Ans. 1. Any gunsmith will test the trigger-pull of your rifle. 2. We know of no such club.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, FEBRUARY 19, 1898.

VOL. L.—No. 8.
No. 246 BROADWAY, NEW YORK.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

"The sale of game should be prohibited at all seasons."

NAILS DRIVEN IN 1898.—No. I.

Resolution adopted at the Interstate Convention of Game Wardens, at Chicago, Feb. 8:

"Resolved, That it is the sense of this meeting that the several States here represented pass laws looking toward the final prohibition of the sale of all game protected by law."

THE FISH COMMISSION DEAL CONSUMMATED.

LAST Monday the Senate confirmed the nomination of George M. Bowers, of West Virginia, to be United States Commissioner of Fish and Fisheries. This consummates the deal by which the President has turned over an important office to the politicians as spoil. It expresses also the Senate's acquiescence in President McKinley's violation of the statutory provisions governing the appointment. Commissioner Bowers has been put into the place in defiance of law; and it should not be forgotten that despite his appointment to the commissionership he has no legal right to it. He holds the place only because in fulfillment of a political deal the President elected to violate the statute, and the Senate elected to uphold him in the violation.

The immediate future of the Commission will depend in a measure upon the course Mr. Bowers may pursue with respect to the employees in the several divisions. Long before his nomination he made promise of places in the Commission to certain personal friends who were working for him, and whose qualification for these places was that they were working for him. It is not to be supposed that one who has secured his own appointment in the way the new Commissioner's came to him will be squeamish about dismissing trained and experienced men from the force to make way for his own personal friends, however wanting in fitness they may be. There is, however, a bare hope that in this respect Commissioner Bowers may follow the course of Commissioner Brice, who, when he realized the magnitude of the work of the Commission and his own incompetence to deal with it, actually had not the courage to carry out certain prearranged deals and deprive himself of the saving services of experts. What has been accomplished under Commissioner Brice has been the work of his subordinates, and work achieved in spite of their chief's lack of qualifications. If the new incompetent shall have the sense to retain the old men in their places, they may be trusted to withstand the utter demoralization of the Commission's affairs otherwise to be expected.

YELLOWSTONE PARK EXTENSION.

COL. YOUNG, Acting Superintendent of the Yellowstone National Park, has prepared a measure which Secretary Bliss has sent to the Public Lands Committees of the House and Senate, to enlarge the boundaries of the Park. The proposed extension would include the present timber reserve in Wyoming east and south of the Park, the Teton Forest reserve set apart by President Cleveland in 1896 and including the Jackson Hole game country, a tract of low land at the southwest corner of the Park, and a mountainous strip in Montana to the northwest. The enlargement as projected is a step which has been urged in these columns for many years, and it is one which has the cordial support of all persons familiar with the game conditions of the Park and contiguous territory. One reason for the extension is, in brief, that such a change of boundaries would include tracts of country now infested by gangs of poachers who raid on the Park game supply, and by their removal would insure the better protection of the Park itself.

Another consideration is that the proposed territory to be reserved includes some of the most important inter-ranges of Rocky Mountain game, which might well be constituted Government refuges.

SNAP SHOTS.

THE question of the public control of dogs in large cities, always a perplexing one, has been considered settled, in a way, in this State by the operation of a law which intrusted that control to the Societies for the Prevention of Cruelty to Animals, or to the Humane Societies. Under the system, which has been in effect for some years past, owners have been required to pay a license fee to the local society of \$1 for each dog, receiving in return from the society a metal tag to be attached to the dog's collar. Dogs found in the streets without the license tag have been taken by the society, and if unredeemed have been killed. The system, while meeting some individual opposition, has been generally acceptable. The public welcomed the efficient and decent services of the societies' agents always in grateful contrast with the thieves, thugs and murderers who in large part constituted the old force of licensed dog-catchers. So general, in fact, was the satisfaction with the new order of things that at first no one thought of inquiring into the constitutional aspect of the law, and this phase of the subject has only just now come up for consideration.

The unconstitutional character of the law has just been determined in a case decided in the Appellate Court. Frederick Fox and Melvin L. Evans, of Albany, brought suit in the Supreme Court against the Hudson River Humane Society to restrain the society from destroying their dogs, for which licenses had not been paid. Their contention was that the law was unconstitutional, and the Supreme Court finding against them, they carried the case up on appeal and secured a reversal. The Court held, in an opinion by Justice Landon, that in this State dogs are property, and may not be destroyed without due process of law; and that the grant of a license being the exercise of a sovereign power, the right to exact a license may not be delegated to a private corporation. We quote:

"The important question here is: Suppose he refuses to take out a license for his dog, can the dog be summarily killed or confiscated without any process of law whatever? When the law of the State was that dogs were not prima facie property, but must be proved to be valuable before they could be treated as such, it followed that the killing or confiscation of a dog, prima facie, affected no property right, and was no legal grievance. But now dogs in this State are property (Mullaly versus People, 86 N. Y., 365), and, of course, within the laws for the protection of property. * * * Now, it is plain that whether a dog is licensed or not does not affect its character. A good dog is none the less so though it wears no collar. The statute of 1896 does not declare the keeping of an unlicensed dog a misdemeanor, nor does it declare that the dog that wears no collar is presumptively a nuisance. The plaintiff does not put his dogs to an improper use. They are neither vicious nor dangerous. There is, therefore, no ground upon which we can assume that the plaintiff's dogs are a nuisance, and hence the defendant's right to kill them must rest upon some other basis, or be denied altogether. * * * If we assume that the killing or confiscation of the plaintiff's dogs is the penalty prescribed for his disobedience of the statute, then the same reasons which entitle him to his day in court before a penalty in money can be exacted apply before the penalty in dogs can be exacted. In neither case can he be deprived of his property without due process of law. The currency in which the penalty is exacted cannot affect the principle. * * * Under the act of 1896 no dog in the city of Albany has a prima facie right to live unless it wears a collar of the defendant. * * * The grant of a license is the exercise of sovereign power. To require the individual to pay a private corporation for a sovereign favor seems to be contrary to the fundamental principles of popular government. * * * We have no doubt the defendant is a most worthy institution, but however great its merits, they cannot obscure the vice of such legislation."

This, then, abolishes the existing system of caring for the dog population in great cities; but the societies

which have done the work so effectually and well should in some way be empowered to continue it. We must have dogs, the supply must be controlled by some license system, and there must be some machinery for enforcing the purposes of the license. Experience has shown that the best machinery is that provided by the S. F. P. C. A. and its kindred organizations.

The New York State Museum Bulletin for October is devoted to the subject of "Road Materials and Road Building," which is treated in a comprehensive, masterly style by F. J. H. Merrill, Ph.D., Director New York State Museum. There is no one who will deny the utility of good roads and the great need of them in this country, but there are few indeed who know how good roads should be constructed, or where the best material for them can be obtained. The preparation of such a bulletin as the one in question represents a vast amount of effort. There was an enormous amount of detail to investigate and arrange so as to be available as matter for instruction and reference. In respect to the material available in the State of New York, Director Merrill communicated with nearly 2,000 quarrymen, the information obtained being condensed into forty-two pages of letterpress, to which are added fourteen full-page diagrams and half-tones showing the manner of constructing first-class roads, the different stages of construction being so clearly illustrated that any one with ordinary ability can understand perfectly how the roads are built, and in what their excellence consists. The maps which accompany the bulletin admirably supplement the work. The front pocket cover contains one of New York, showing the distribution of rocks most useful for road material, and the back cover contains a large map showing the whole State on a scale of 1 in. to twelve miles. It gives an accurate location of every stone quarry used for building and road metal. By means of colors and symbols the quarries with crushers are shown, and the bluestone, sandstone, limestone, trap, granite and slate are distinguished. A short review of the history of roads is presented as an introductory, and the important reasons for road improvement throughout the country are set forth as follows: "First, the desirability of reducing the cost of hauling; second, the importance of making most of the roads fit for pleasure driving, thereby attracting to the rural districts in summer thousands of people who create a market for various farm products; third, the economic principle of preventing the great waste of labor which is now fruitlessly expended in making bad roads."

The topics principally considered are the Problem of Road Improvement in New York, Natural Roads, Road Construction, Earth Roads, Construction and Maintenance, Road Materials and their Distribution, Tests of Road Material.

In the construction of roads the essential points to be considered are set forth as being a hard, smooth, waterproof surface and a thoroughly dry foundation. Little as the general public knows of these principles, it is pointed out that they were known to the Romans 300 years before Christ. The road, moreover, must be built of sufficient strength to resist the weight and wear and tear of heavy traffic, and the surface must be smooth, so that there will be no undue strain on vehicles and no undue expenditure of force in drawing them.

The very fact that the Illinois Sportsmen's Association has held a midwinter convention for the consideration of game and fish interests is in itself full of significance and promise, for it means that the concern and activity of the organization are not longer to be restricted to trap tournaments.

If Mr. Henry Talbott and his committee associates of the District of Columbia Association shall carry out the programme he has laid down of a comprehensive and exhaustive investigation into the subject of river pollution, they will perform a service of national scope. The task is of such magnitude, however, that it might well be intrusted to a Government commission. The interests involved are of importance beyond computation. Public health, water supplies, manufacturing industries, the fisheries—all these are concerned.

The index of Volume 49 is sent with this issue to all subscribers, and will be supplied on application to others who may wish it for bound volumes.

The Sportsman Tourist.

Canute Feast with Bear Dessert.

I LIVE in the Short Grass country, in western Kansas, west of the 100th meridian. I've got a lot of young ones, a lot of cows, young and old; a lot of horses, mares and colts, and a big closet full of guns, rifles and everything that makes a sportsman's heart warm when he looks at them.

I have to keep it locked, for my two boys, I believe, could use up all my cartridges in a week on snowbirds and rabbits.

I received a letter from Mr. Miguel Trebinio about a month since. He lives on Rita Azul, in New Mexico. It read thus:

"Friend Mine: Come at once to Rita Azul. I have a trade to make, and I want you to help me. It is our horses for cattle. I think if you come out, by the help of the Santa Nina (Blessed Virgin) we can skin him. I also have a bear in a hole for you. You are also invited to a canute game and a feast. Your brother,

"MIGUEL TREBINIO."

Who could resist that plaintive appeal? A bear, horse trades, canute and a feast were too much. I wrote: "Expect me Monday night. Meet me at the train with the buckboard."

Sunday eve at 10:30 found me on the A., T. & S. F. train, where the colored porter kicked because I wanted to put my rifle and shotgun to bed with me. I try to handle a rifle as carefully as if it was glass, for a little careless knock may disarrange the sights, and it's heart-sickening to miss a deer after half a day's work with one's nerves on a strain all the time. I finally gave him 50 cents to go and see if my setter was all right in the baggage car; put my rifle to bed, and meekly turned over the shotgun when he came back. He took it and looked at the case a minute and then said: "If you want to sleep with that gun, boss, put him in bed. I guess he won't hurt noffin." So in it went, and I went into the smoking room and talked to the conductor for some time. He is a sportsman, and I made him very uneasy when I told him of all that was before me. At last I went to bed, unwillingly. I hate to go to bed and hate to get up. The porter aroused me at 8 A. M. with: "Boss, the train is almost got to breakfast." So I got up, and at La Junta we ate. In thirty minutes we were steaming toward the south. The Spanish Peaks came in sight, then the Raton Mountains, and at last my own beloved Mesa de Mayo, or May Mountain. It is full of trees and grass and water and game, with a sprinkling of horse thieves and an occasional bunch of Ute Indians that make it, taking it as a whole, altogether lovely. Near Thatcher I saw a band of seven or more antelope grazing at a distance of a mile from the track. They were southeast from the station. They were not disturbed by the noise of the train, and were still feeding with their heads down when I saw them last. It looked encouraging, and I hoped that my bear was asleep and doing well.

We steamed into Trinidad at 12 noon, and I had a very tough beefsteak at a restaurant and then went into a grocery store and bought things. I tried to buy a little of everything that was easily cooked or could be eaten raw, and had them boxed in two Arbuckle coffee cases, leaving orders to ship them by express at once. Then I went to the Denver and Fort Worth Railroad Depot, and after thirty miles of a run on the north side of the Raton Mountains and parallel to them I got off at a woebegone little station called Trinchara. The place consists of a depot, a store containing a post-office, four dilapidated cans of peaches, a bar of soap and a very drunken and disreputable proprietor—an American married to a Mexican woman. But here came Miguel driving three horses before him, one with my saddle on him, the other two bare. "Why didn't you bring the buckboard, Miguel?"

"It is broken. Part of the harness is lost, and the workhorses are gone with the cavayard. They are all gone. I borrowed these horses from Jesus Mestis to come for you. My son Luis is off after the horses on a mule, and Inez is after them on her jackass."

"I have two big boxes and a valise to pack, and we will have a time getting home, I fear."

"No, Señor, if the diamond hitch does not hold when I make it I am willing to leave the boxes in the road."

So I meekly unrolled my bedding, made impromptu packsaddles, and those two boxes went on a horse, one on each side, with the grip on top. On the other horse went two sacks of oats and my two guns. In the two sacks of oats were twenty-four bottles of beer and a large jug containing 2 gals. of fair whisky, my contribution to the feast at the canute game. Mexicans are like Indians, crazy for anything intoxicating, and I am very fond of my Mexicans, and a little won't hurt them. Poor devils! they can't get anything decent to drink in the shape of stimulants often. The whisky of the wilds of Colorado is simply awful.

And we started. The packs rode as if they were part of the horses. We landed at the ranch to find the horses all back and Inez cooking supper. I had a room all to myself in the old jacal.

The ornaments amused me. A skull, a cheap print of the Virgin Mary, and my photograph. It's a very saucy photograph. It shows me dressed in buckskin—old, worn buckskin—and I looked as wild as a hawk, and felt so, when I had it taken seventeen years ago.

When I got my store clothes off and came out into the kitchen Luis had got into the grub boxes. Luis is sixteen years old and as inquisitive as a monkey. But it was all right. I scolded him as if he was my own boy, and told him that his shame was lacking and his gall was large, and he seemed deeply affected. Then I consoled him with some candy that he likes as well as if he were younger.

We were hardly through supper before the guests began to assemble for the canute game—about twenty men and women.

Juan Madril and his wife, on horses, came first. Juan is about seventy years old. He is tall, lean, sinewy and dark. He has an eye like a hawk, and long, straight black hair, and is as active as a boy. His father years ago captured a Comanche girl, took her home and mar-

ried her, down in old Mexico. She had many sons, and they were all smart men, and all of them now alive are well-to-do, but the Indian sticks out in them in many ways. Doña Luisa Madril is fair, fat and forty, and a good woman. They alighted, and Juan shook hands with me. He remarked that he was glad to see me alive, and I told him that I was glad of it also. A boy took their horses, and just then up came a wagonload of people. Miguel turned to receive them, and I heard Juan say to his wife: "Miguel is putting on much style, having four peons for our horses."

"That's El Dick's doings," replied Luisa, and it was true. I had told some boys to take care of the horses, because I knew my Mexican compadres would be cold when they arrived, and a man to take one's horse, a welcome, a cup of hot coffee and a good fire make any one feel contented.

Don Andreas Lucero was in the wagon. He is ninety years old, almost blind, and as jolly as a boy of sixteen. His wagon was full of his friends, and they all tumbled out and went in.

The women were mostly dressed in black, with red shawls over their heads, and there were two or three very pretty girls among the crowd. The best-looking and smartest of the Mexicans showed Indian blood. I think it must have taken an enterprising Mexican to catch an Indian lady seventy-five years ago.

The house was brilliantly lighted up with about twenty candles, while my head lamp was hung up at the main entrance and shone a long way down the road. My head lamp is a Furguson, and is useful everywhere. I have killed a few deer with it when I was very hungry, but you had not better get one, because it's too easy to kill deer with them. I want every one but myself to still-hunt.

Canute is pronounced kanyootey. It is a game invented by the Navajo Indians. It is played with four sticks 10 in. long, 2 in. in diameter, round and like a big, fat candle; a hole in each stick 6 in. deep; each stick is named and marked on the butt, No. 1, No. 2—the mulatto and the sinchow (or the one with a girth). The players choose sides. There is a hole in each stick 8 in. deep, and the game is to find an iron nail that the opposite side hide in one of the sticks. They hide the iron in one and plant all four sticks in a pile of dirt, butt up. One man walks up to the pile, and his aim is to pick up the stick with the iron in it third. Each side has on the start fifty-two beans, and the side that gets them all wins. If the hunter picks up the stick with the iron in it first, he has to pay ten beans; if second, he has to pay six beans; third, he does not pay anything, and he and his side do the hiding and the other side has to hunt the iron. If he picks it up fourth, he has to pay four. If he don't win the iron, his side has to hunt the iron again. The game is a rather dirty and noisy one. Men and women all bet on it, and they most of them sing Indian-Mexican songs while the hunter is after the iron. This is one of the songs:

Ora see, ora no, ele canyootey no sa van.
Der la welta millyonara
No mass yo say undestan.

Or, to put it into English:

Now yes, now no,
The canute does not go
In this universe of millions,
I'm the only one can know.

And then they would all howl like wolves, and the hunter would scratch his bushy pate and make a grab and get the unlucky stick. And then his side would jaw and pay from their bean cup, and the other side would hide the iron again.

I finally got excited and bet a horse on the game with Inez against her jackass, and lost it. She offered it back to me the next morning, but I observed that she and Luis had got up very early and put her brand on it. Bless the old lady, I'd give her ten horses if she wanted them, for she is of the salt of the earth. I love her, and she is the ugliest woman I ever saw, and seventy-five years old.

At 12 o'clock we had the feast—lots of beef, bread and coffee, with no milk or sugar. I turned loose the stimulants, and all went merry as a marriage bell. At 12:30 they commenced playing again, and you should have seen them bet and sing and holler. I quit them after a little while and went to bed. The game broke up at about 2 A. M.

Miguel made me get up soon after day, and after breakfast we went and I traded some three-year-old horses for some two-year-old steers. Horses are unsalable and steers are cash, but I don't think I made a fortune, and told Miguel so. I believe he could have done better himself, but he is afraid that I won't like it if he trades. To tell the truth, I don't care much what he does with them, for I bought them for him, and they are really his, though legally I own them.

Toward night we rode up on the hills and over to a deep mountain gorge with a stream in it called Rita Buey, or Ox Creek. There are a few big cottonwoods in the creek bottom. We had concluded that the turkeys would not roost there that night; the old fellows began to sail off the steep bank up a tree. I knew they must be fat, for they made lots of noise, and one missed the tree and had to go up the hill and try it again.

Twenty-six big turkeys went to roost that night. We waited till they had got quiet, and then crept up under the trees. One old gobbler said "put, put," and I shot him in the head with No. 6 shot and smokeless powder, and down he came with a crash, and I could hear him beat a tattoo on the ground. Miguel got one, and I shot another as soon as I could see after the glare of my gun, and the rest flew in every direction out into the night. We got our three and rode off home well satisfied. I could have camped there till morning and got half the flock with a call, but we had all we wanted, and I am going to hunt them next year, I hope. Twenty-pound turkeys, raised on spring water, grasshoppers and piñon nuts, are good eating, and old Inez came out bareheaded with a torch when we got home, took the game and seemed very happy.

After supper Miguel told Inez of the hunt, and she said that we had killed one too many; that we could get them any time, and that we were good hunters; and I swelled with pride and gave her a big package of tailor-made cigarettes from one of my grips. "Such are

the rewards of the skillful flatterer," said Miguel. "Give me some, too"—which I did at once.

Then Miguel told me about our bear. It appears that he had found a cave near the head of Rita Buey during the summer and crawled into it after being well satisfied that there was nothing in it. It was 20 ft. straight in, at the base of an enormous pillar of rock called the Big Nigger Head. It then turned to the right a few feet, and there was a nest. There was sign of a bear around there, and he was satisfied that it was holed up for the winter.

It is, as all well-regulated and sensible people know, not pleasant to get up very early in the morning. A bear which has probably been asleep a month and is in a cave will be there at 10 or 11 as well as at 6; and so when I went to bed I told Miguel to leave me alone till I wanted to get up in the morning.

At about 10 I crawled out and ate breakfast, and saw my horse and two others already saddled. When Miguel and I picked up our guns and went out Inez came out with Luis' rifle instead of Luis, as I expected, and I heard Luis singing, as he washed the breakfast pans, a mournful dirge in Mexican, which, as translated, was: "My heart is broken by thy bright black eyes." I asked Inez if she was going, and told her that she would catch cold; and she calmly informed me that she had on my old corduroy pants and Luis' boots; that she had not been hunting for some time, and that she was young. That settled the question, and we mounted and rode away. The old lady presented a queer spectacle, astride of a very frolicsome pony, with an old gray muffler, very dirty, turban fashion on her head; Miguel's old blue army blouse, a new pair of gauntlet gloves that I gave her right there, for she was bare-handed; a calico skirt, my pants and those boots! She was smoking a cigarette, and I longed for the skill of Frederic Remington, or even a kodak.

So away we went. Miguel had a jack rabbit in a bag; a long cord, a bunch of rags and a bottle of kerosene. After a long climb we got within about 300 yds. of the cave or den, and could ride no further; so we tied the horses and climbed up on foot. The den is on a ledge about 10 ft. wide, and runs under the cliff that towers up for hundreds of feet. When we got there Inez perched herself on a rock about 10 ft. from the mouth of the cave, with a Winchester. Miguel had my .45-90, and I had my 8-bore, 15 lb. shotgun, loaded with cartridges containing nine .44 cal. buckshot and 7 drs. of powder. The programme was to tie the cord to the rabbit's leg, tie the rags to his tail, soak them with kerosene, and send him into the hole, and when the bear came out, to kill him. If that didn't work I was to put on my head lamp and crawl in and pot him, or he me. I wanted that bear if he was there.

Miguel took out the rabbit, and it squealed; tied the rags to his tail with about 1 ft. of play; hitched the long cord to his leg; got down on all fours at the mouth of the den; pointed Brer Jack into the hole, and setting fire to the rags, turned him loose. He immediately wheeled around and jumped over Miguel's shoulder, away from the cave. The burning rags hit Miguel a swipe on the whiskers and scorched them some. The rabbit then jumped off the ledge and set the dry leaves afire to the length of the cord. I dropped the gun and Miguel and I went to putting out the fire.

About the time we had got the fire put out and I had turned the jack loose we heard a dull, muffled roar above us, and Miguel exclaimed, in accents of despair: "That old witch has gone in and killed your bear." We scrambled up on to the ledge, and here came Inez out of the hole with my lamp strapped on her head and my big gun in her hand. We waited. Some smoke came out of the cave, and all was still. Miguel and I both wanted to go in, and finally drew matches to see which of us should go, for two should not go in at once. If a man is alone he can get out better than if a man is behind him, Miguel won. In he went with the head lamp and the shotgun, and soon came out and said the bear was dead, and that we must get a rope and two of us go in and drag him out. We went down to the horses and got a rope, and both crawled in and cut a hole through the bear's lower jaw, and finally got him out. He was a black bear, and weighed about 200 lbs. The top of his head had been blown into a mush by the big gun. Inez said that when she got down to the bear he looked like a big, round cushion of fur. She finally saw his ears, shot him once between them and then came out very quickly. Miguel told her that she had done wrong; that the bear was mine, and that I should have shot him. She said that she was a very old woman and that we were young and could probably find other bears before we died; that she had always wanted to kill a bear, and that now she had killed one. I told her that I was not angry. So we skinned and cut up the bear, and putting the meat on Miguel's horse and my own, and the hide on Inez's horse, we slowly wended our way down the mountain, single file.

I came home next day and brought some bear meat, which, by the way, is not very good eating. I made Inez take \$10 for the hide, and she sniffed a little when I came away, and said she was sorry that she had killed my bear. I am going to tan the skin and use it for a lap robe. Miguel informed me privately that the next time we went bear hunting Inez should stay in camp, for she was too fast and inclined to want to hog things. He also said he hoped she would steady down when she got older. She is about seventy-six now.

Home. A bath, a shave and clean clothes, a big pile of correspondence and some bills to pay. My wife and children seemed glad to see me, and my boy Will, who could not well go with me this trip, made me tell him much more than I have told you.

Hasta la manana.

CIMARRON, Kan.

W. J. DIXON.

"Men I Have Fished With."

MR. FRANK A. BATES, president Boston Scientific Society, writes: "The book is most interesting, covering fishing and shooting, hunting, trapping, woodcraft and clean-cut character sketches of many sorts of men. I have read it through twice, and when I feel tired and cross with the world I take it down and read a chapter of humor or pathos, and my brain is refreshed."

Mr. George B. Wood, of Reuben Wood's Sons, Syracuse, N. Y., says: "My dear Major Fred: I thank you for the sketch of my father and of my uncle Ira. Both are very lifelike, and while I did not know the other men in the book I know them now, for each individual stands out clear and distinct."

Just About a Boy.—VI.

"Ducks 're flyin'," said the boy, as he met me at the corner. "Less go up river 'n' git some. I know where they's a dandy place, string o' pon's out in the edge o' the timber 'n' some more up in a big pasture, with corn-fields right clost by."

"Always git lots up there when they're a-flyin', 'n' sometimes a goose, too. Will yeh go?"

"I guess we'd better. Any show for snipe up there?" I asked.

"Gee, yes! Always jacksnipe around the pond in the pasture. Yeh see, one end of it is kind o' springy 'n' has lots o' little watery places in it where the cattle have tromped 'round, 'n' the jacks 're always at that end. Ain't very many of 'em, but they's gen'ly some."

"I'll tell yeh what less do. I got a good tentin' outfit. Less take it 'n the boat 'n' go to-night 'n' camp, sost to be up there early 'n the morning. That's the best time, you know."

"All right, I guess I can fix it," I answered. "You go ahead and get ready, and I'll be over to the house in half an hour. What will we need to take in the way of grub?"

"Oh, I got enough grub cached up at the maples to last us, 'n' I'll throw what else we want into my packsack 'n' pick up the rest up there as we go along."

We separated and got our traps together, meeting at his house half an hour later, ready for the trip. It did not take long to get to the river and load the boat, and by the middle of the afternoon we had reached the boy's camp at the maples, about four miles up stream. Here he "dug up" a complete camp outfit, excepting blankets, from his snugly hidden cache, and we proceeded, equipped for staying two or three days if we chose.

"Yeh see, the ducks 'll come in with the wind 'n' shoot down this way, 'n'en circle back 'gainst the wind. They come like a streak, 'n'en when they pass the pond they come back slow 'gainst the wind, sost to 'light; 'n'en, when they pass us, is the time to plunk it into 'em. They are goin' too fast with the wind, but they're easy comin' back."

We had only got comfortably settled when a whistle of wings passed over us, going with the speed of an express train, with the wind.

"Teal," said the boy, though it was still too dark to see more than a bit of swiftly moving black cloud against the sky as they passed.

"They'll be back 'n a minute, 'n'en whale away at 'em as they pass. Shoot at the bunch if yeh can't see a single bird," said the boy.

Sure enough, a few minutes after the sharp whistle of wings swiftly beating the air sounded again almost over us.

"Give it to 'em," said the boy, as he turned both barrels loose at the moving mass. I did the same, though neither could tell whether we had killed a bird or scored a miss after the flash of the guns.

"Reckon we must 'a' got one er two, anyhow," the boy remarked. "They can't get away, 'n' we can find 'em when it gets light, if we did," he continued.

When the next flock came the morning was gray enough to pick out our birds, and three teal fell as the guns barked. These the boy quickly brought in, and again we crouched, waiting in the grass.

A bunch of five mallards came next, and we stopped every one, a proceeding that so elated the boy that he characterized it as "a whole lot lucky."

Ducks in job lots kept coming, some passing without giving us a shot, others circling back only to fall as the guns cracked, and the pile grew beside us until we had

beside himself, as he ran after the cripples, working like a 10 H. P. engine.

When we had our six piled up the boy said: "Now I'll go 'n' git that cripple out'n the pasture, 'n' you better circle around the other end of the pond by the springs, 'cause maybe you'll git a jack er two in there yet."

I did as directed, and got a pair of fine fat snipes out of five that pitched up from the march. Looking toward the boy, I saw him foot racing the wounded goose, which could half run, half fly, and keep ahead of him.

After chasing it for a couple of hundred yards, he stopped, threw up his gun, and as the white puff of smoke pitched out of the gun the goose doubled up. Coming back, we gathered up our game and struck for camp, the boy keeping up a running fire of talk on geese in general and these geese in particular, as proud of outpotting the seven as though it had been the making of a million dollars—and probably more satisfied with it.

When we reached camp he was willing to go home, and we soon had the boat under way. At the maples we re-cached his camp outfit and continued down stream, reaching home before dark, and every one that saw us on the way home from the boat had to stop and ask a thousand questions about those blessed geese.

EL COMANCHO.

Little Assinaboine's Charge.

I WAS much interested some time ago in reading in your columns, under the title "Stories of a Heroic Age," some accounts of Indian adventure by Messrs. Kelley and Grinnell, both of whom I have known for many years. These adventures took place in the old buffalo range, which was also the fighting ground for Sioux and Cheyennes against Crows, Blackfeet, Northern Gros

THE MODELED FORM READY FOR THE SKIN.

THE LIVING MODEL.

TAXIDERMY AND SCULPTURE.

When we reached a point opposite the ponds we pulled in and soon had camp made among some jack oaks that grew well above the river, and when darkness came we were comfortably housed.

Ducks had been passed on the way up, flying in many directions, but none came near enough for a shot, as we were in midstream and only traveling, not taking any measures to conceal either ourselves or our boat.

Darkness settled down with a muddy sky and a promise of dirty weather, a prospect that set the boy to whistling contentedly as he put the finishing touches on the camp.

"Goin' to git a nor'west wind in the mornin'," I reckon," he said, with a yawn; "'n' if we do, we'll git ducks, too, 'cause they'll come a-hummin' from the north if it comes a little cold."

"Less go to bed, sost we can git up early."

We curled up in our blankets, and the last thing I remember was watching the flare of red spring out of the bed of coals where our fire had been, every time a little whirl of wind eddied down through the oaks and bulged the tent flaps open.

"Hay! Goin' to sleep all day?"

The boy was up and dressed and reaching for the strings that held the flaps of the tent together when I opened my eyes. It was still dark as pitch, and the boy had the lantern lit inside the tent.

A cold, raw wind was hurrying down the river, tossing the branches and making the trees moan in a desolate way, and the low-hanging clouds hurried by with it.

"Come on, less git a hustle on us, or it'll be daylight 'fore we git started," said the boy, as he skurried around making preparations for our morning meal.

I got the guns and shells out, and prepared the camp for leaving, while he was busy with the frying pan and coffee pot.

"They're a-flyin'," he said, as a flock of ducks hurtled by on whistling wings, following the course of the river.

After breakfast we hurried to the pond in the timber edge, and were soon concealed in the high slough grass on the lee side of the water, a position the boy selected.

twenty-nine between us for the morning's shooting when the flight ceased and we had gathered in all the cripples.

"Less take these to camp, 'n'en go over to the other pond," said the boy. "Reckon we can get a few more over there if we sneak up on 'em, 'n'en we'll sure get a few jacks, too, round the springy end." We packed our game to the tent and then went over to the pasture pond, walking up to it through a little draw that put into the valley.

"Oh, gee!" said the boy, in a stage whisper, as he peeped over a little bank of earth that hid us from the water.

"They's about fifty geese out there, settin' all tucked up like a lot o' mummies. Got any big shot?"

"No, nothing but fours," I answered.

"Well, here; pull yours out," he said, swiftly throwing out his duck loads and replacing them with BB shells.

"I got lots of 'em, 'n' you can change your shot. Wish we both had the same size guns."

He was digging out the wads from a couple of his 12-gauge shells with his hunting knife as he spoke, and I was working nervously with a couple of my No. 10s.

When we had reloaded my shells with the heavy shot, the boy said: "Now, all ready; we'll count three 'n' raise up 'n' shoot. You take the left side o' the flock 'n' I'll take the right. Git in two shots 'n'en load juss as quick as ever you can, 'cause they may circle back."

The suspense was ended when the boy said "three," and we turned four loads loose among the unsuspecting geese at a distance of 30 or 40 yds. A crackling flap of beating wings, mixed with frightened honkings and a gabble of sounds, smote our ears as the flock took to the air, leaving six of their number unable to rise. The boy threw in another shell and pitched the load after the retreating birds, and another one spread his wings and sailed out of the bunch at a flat angle, striking the ground a quarter of a mile away in the open pasture. It took three more shots to stop the cripples before we could gather up the dead.

"Gee! ain't this luck for yeh?" said the boy, fairly

Ventres, and other plains tribes. On this old buffalo range the buffalo Indians used to meet and to fight, how bitterly and how bravely no one can appreciate who was not in the country at that time.

The Crows and the Sioux were almost always at war, and the stories which I have referred to bring up to my recollection a tale told me by two Sioux Indians who were engaged in one of these battles. These men were named Lone Standing Bull and Round Wooden Cloud. I have no reason to doubt their veracity, and as will be seen later their story was confirmed by the appearance of the battleground as I saw it.

It had been the practice of the Sioux war parties in attacking the Crows to send a small party to rush through the camp, and when the Crows turned out, to retreat, drawing most of the young men after them in pursuit. The fleeing Sioux would lead the Crows into an ambush already prepared, when of course the Sioux would usually gain the advantage.

In the particular fight of which these two Indians told me thirty-one Crows, a horse, and a dog belonging to them were wiped out in the year 1870 by a large party of Sioux under the leadership of Little Assinaboine. This is how it happened:

A party of thirty-two Crows on a war expedition found themselves near the Yellowstone River close to a large Sioux camp. A council was held, and it was determined to raid the camp for their horses. All the Crows, with one exception, agreed to this, but one man claimed that the risk was too great, and that he would not remain. He therefore left the party and returned to camp, he being the only one of the ill-fated thirty-two ever to return home.

Two scouts were sent forward to locate the horses belonging to the Sioux. They went close to the camp and lay in some brush, waiting for evening, and while there two young Sioux boys were seen approaching mounted, but unarmed, no doubt going after horses.

The Crows agreed that when the boys had come close

to their hiding place they would kill them with arrows, as the noise of firearms would discover them to the camp. They killed one of the boys, but the other, although wounded, managed to escape. The Crows scalped the one killed and then made the best of their way back to where the main war party was. On telling them of their adventure, it was determined to move away as fast as possible, and to gain a rocky hill some distance toward the Yellowstone, as the Sioux would without doubt at once follow them.

This place was they thought impregnable. On the top of a small hill there was an open space of quite an extent, but entirely surrounded by rocks several feet in height. They believed that here they could stand off any number of Sioux that might be sent against them, and as they had plenty of ammunition they were not at all alarmed for the result. That night they reached this rocky fortress without being overtaken by the Sioux, who, however, were hard on their trail, and before morning made themselves secure behind the rocky breastworks. As soon as the wounded boy had told his story a very large war party of Sioux had started after the Crows. It consisted of several hundred warriors, but some time was consumed in finding the trail, so that the Sioux did not come within sight of the place the Crows occupied until the next morning, and on seeing the natural fortification the Crows occupied a council was held by the Sioux to determine what should be done. Many plans were suggested for dislodging the Crows from their stronghold, but none were found practicable, and at length the chiefs agreed that the place was too strong to take, and that it was better to leave the Crows alone, as a great loss of men must occur should they attack, and the result would be more than doubtful. It was therefore determined to return to camp and leave the Crows alone, and a large majority started on their return.

On seeing the Sioux begin to withdraw the Crows sprang on to the rocks, taunting, and making derisive and contemptuous gestures, such as waving their breech clouts and other mocking signs.

Now among the Sioux was a chief named Little Assinaboine, who all through the council had remained silent. He was a noted warrior, and very brave. When the main body of the Sioux had started to return to their camp he had not followed them, but with a few of his followers had remained watching the Crows. He now turned to one of his young men and said to him: "Follow the party who are returning, and tell them all to come back at once; that I say so." The messenger soon overtook the party, who, on receiving the message, at once returned.

Now," said Little Assinaboine on their return, "these Crows have killed our young man; they taunt us with cowardice. Let us give them all the fight they want."

"We will divide up into two parties; I will lead thirty men, and we will make a dash straight for their stronghold. I know it well, and have been in it many times. If we can get right up to the rocks on the outside we will find many large cracks between them, and we can see right into where the Crows are, and can push our guns through and kill them on the inside."

"The main party will go round to the other side, and when we are right up to the rocks they can rush up and climb over. The Crows will not see them, as I shall keep them occupied."

This plan was at once adopted, and after singing their war song they commenced to put it into execution. Little Assinaboine with about thirty men strung out some distance from each other made a rush for the wall of rocks; the Crows poured a murderous fire into them and no less than eleven men fell dead before they reached the outside of their hiding place, which, led by Little Assinaboine, they at last gained. When they reached the outside of the rocks they found, as he said, many cracks through which they could see the Crows inside, and through which also they could push their guns. This they did, and in this way slaughtered many Crows, being themselves safe from any fire from within.

In the meantime as soon as they saw that Little Assinaboine had gained the wall a hundred or more Sioux had rushed to the place from the other side, and a slaughter grim and great took place. It was not over until every Crow—thirty-one in all—had been killed, together with one horse taken from the Sioux boy killed by the scout, and a dog.

The Sioux lost many men, and Little Assinaboine was wounded.

In commemoration of Little Assinaboine's brave rush for the rocks the Indians followed his footsteps in the snow, and in each footprint placed a flat rock, thus marking his trail from the place he started the charge. After this he was looked upon as one of their bravest warriors, which he most undoubtedly was. The memory of their great loss remains with the Crows until this day.

I visited the spot in 1878, and the long zigzag trail of flat stones where Little Assinaboine stepped was still plain to be seen. Within the rock inclosure I found many human bones, together with those of a horse and a dog. I therefore had no doubt of the truth of the story.

The rocks on the outside showed dozens of bullet marks as fresh as if only fired the day before. This I consider as brave a charge as was ever made by Indians, or even whites, and Little Assinaboine deserved the name of the bravest warrior among the Sioux.

W. JACKSON.

A Society Dog.

ST. AUGUSTINE, Fla.—Now don't laugh, for if Towser is not in society, who is? He calls on most of the cottagers pretty regularly and never misses an afternoon tea or any other social function, and while not actually hitting the ball, is generally, although sometimes an apparently slightly bored observer of the game of golf.

And this seems to be the way it has all come about:

Some two years ago his owner went North in the spring and Towser was as usual left behind. For some reason or other Towser came to the conclusion that if his master and mistress went away without consulting him and left him to loneliness and the servants and perhaps to shorter rations, his obligations as a faithful dog

ceased, and he began to visit around among those he had known as friends of his master and mistress. As he was never obtrusive and always pleasant, with never any suspicion of taking offense, he gradually extended the circle of his acquaintance until it has taken in almost all of the fashionable set. He has the way when meeting any one of his acquaintances of appearing to wish to impress upon them that he is his dearest friend. He seems careful to show that no mere desire for cake impels him not to miss an afternoon tea, as I think he rarely indulges in cake on such occasions. He usually adopts some one household as his regular boarding place for a while, where he can take most of his meals, and varies it with an occasional visit of a day or two to some other especial friend.

During the weeks of early winter, when the winter residents are returning, Towser spends a good part of the day near the post-office greeting his old friends among the arrivals.

Towser, or Rover, as he is sometimes called, is a cross between a collie and a setter. The most marked characteristic of Towser that distinguishes him from the ordinary herd of dogs and links him closer to humanity is the fact of his very numerous friends and acquaintances, both men and women, but of the ordinary dog-like attachment to none.

Like human beings, he has warmer attachments to some than to others. He may think it wise to put absolute trust in none, and his experience when his first family left him may in his doggish mind have taught him to have if possible more than one friend to rely upon.

How he always gets wind of every particular social function I do not know, but he has learned that his presence is always agreeable, and so he very unobtrusively makes himself at home, and if things to him sometimes grow a little dull he seeks some quiet corner and takes a nap, but is fresh and alert as the guests are ready to depart.

It may be that dogs, or at least some dogs, are in the line of the development of the end of the century. W.

Natural History.

Taxidermy and Sculpture.

As yet there are but few people that know that taxidermy and sculpture are arts closely akin. So near are they related that they might be called one, for now to be a taxidermist one must be a sculptor, and the better the sculptor the better the taxidermist. If he is no sculptor he must be nothing more than an old-time "stuffer," whose ambition was to see how much straw or excelsior he could ram into a skin. These old methods are now passing away; an evolution is taking place in the art, and before the general public has had time to realize that any progress was being made, taxidermy has passed from the crude stuffing out a skin to the very highest art in modeling.

It was only a few years ago that some of the most enlightened taxidermists and naturalists began to build a form of excelsior or straw, tightly bound into shape with thread—a manikin, as they called it. Then some one suggested the idea of covering that manikin with a thin coat of papier maché or wet clay to give it smoothness, and later some attempted to model a little, but up to that time the most progressive taxidermist of them all had only been looking at the art from the naturalist's standpoint; not one of them had studied the art of modeling. For this reason the very best of their specimens were void of form save for a few outlines and for their attitudes, which were often correct.

Although these men had pushed the art forward, they were yet far from the point which has now been reached. Their methods then were considered excellent, but time has proved them to be useless from the standpoint of art, for reasons that I will give. Up to five years ago, nothing better was known than to build a form of excelsior and cover it with a coating of wet clay, after which the skin was put over that manikin. Now the skin, being exposed to the air, must necessarily dry before the clay that is under the skin, and therefore any modeling that might have been shown in the clay was spoiled by the tightening and warping of the hardening skin over the soft clay, and where the ambitious taxidermist had left a depression the skin in drying drew out and bridged it over, and where there was a protuberance the tightening skin often flattened it out of shape.

There is another great drawback to the use of wet clay manikins which has come under my observation in the last few years; that is, the bursting of the skin caused by the clay being next to the skin and continually absorbing the animal matter out of the skin. After a while this dries and burns the skin to such an extent that I have seen some specimens that were burst in at least half a hundred different places and with the pieces of skin of what had been a perfect specimen hanging down on all sides. This trouble I remedied by putting a coat of a composition wax over the manikin, the wax being mixed to the consistency of soft butter. This composition, being waterproof, served to prevent the moisture of the skin from penetrating the clay, and vice versa. Besides this, as it was very soft, it served to make the skin stick to the form, and then the skin could easily be slipped into place. These improvements, however, were not enough, for I have found that in drying clay loses about one-twentieth of its volume by shrinkage, and therefore is sure to spoil the modeling to a certain extent, as it never dries evenly. Some parts may have more water than others, and therefore shrink more, so that I have at last decided to discard the old method of mounting altogether.

It was after taking a two years' study of art in Paris that it occurred to me that by making a hard model and doing all the modeling that I wanted in this, and then letting it thoroughly dry before putting the skin on it, I might get the best of tough skins. This has, indeed, brought me far better results than could be attained by the old method.

I have now brought the art of taxidermy to the point

where I have so longed to see it placed—on even terms with sculpture—for I now proceed to model an animal which is to have the natural skin over the model exactly as I would if I intended to produce it in bronze or marble. I first make all my necessary studies, then a small model; then I proceed to make my original model in solid clay or wax, and model it in the same way and with the same care as I would a human figure. With such a model, by using proper care, one can do just what he likes, and if he is any kind of a sculptor he ought to be able to produce a masterpiece of taxidermy. Now, whether I want to produce this model in bronze or taxidermy, it is quite the same thing, save as to the modeling of the hair. I then cast the perfectly modeled form in plaster, then it is a question of whether you want it in bronze or in some composition.

Of course, it is understood that if this model is to have skin put over it, long hair should be omitted on the model, and a little allowance made for the skin—for instance, as in wrinkles, where each wrinkle touches another, the taxidermist must make allowance for the fold of the skin—but otherwise it is exactly the same. One must give every muscle its proper form and relative value to each other muscle; he must make that form take life under his thumb; he must make it breathe. He must get his proper lights and shades, the tones and half tones to each form; must accentuate the form just enough to give it strength, and must let others see what he has seen; in fact, he must do all that a sculptor would do, except to show the texture of the skin and hair.

Often I have wished I had no skin to put on, for one is greatly handicapped by a skin. Take a lion, for instance. No matter how much skill and art you may use in your modeling, if you have not a fine mane on the skin it is no lion at all. I had that experience some time ago in my roaring lion. We cannot make mane grow on a lion's skin, but a short time later I produced one in bronze that was the admiration of those who saw it. Now I was able to do what I wanted, and where the lion's skin had no mane, in the bronze I was able to make it grow to my ideal—a privilege that we have not in taxidermy, where we must take the skins as they are—and so many times I have wished I had no skin to put on the model, but could finish it in sculpture.

I believe that the art of taxidermy is now raised to the highest point that it will ever attain, according to the ability of the sculptor who makes a model that may be cast in plaster and then in a composition that will take the perfect form of your molds, whether it be cast in bronze, zinc or lead, or any metal or composition that may be permanent. To this perfect form the skin must be applied, glued tight, every curve of the hair and every fold of the skin being in its proper place. When this has been done I do not think that more can be asked for, save the live animal itself.

GEORGE H. STORK.

Camp-Fire Flickerings.

"That reminds me."

MERT WILLIAMS was a printer, and he "held cases" on a morning paper. Al Walker was a machinist. The two were neighbors. When work was slack in the shop and Walker was laid off, he would take his hook and line and stroll along the river bank. When Williams put on a "sub," which he did one and two nights a week, he would devote his spare time to practicing shorthand. To-day he is court stenographer at the price of \$3,000 a year, while Walker more than ever strolls along the river bank, for the machine has made sad havoc with the machinist. Williams's mouth would "water" for fish when Walker passed his way with a fine string. Walker suggested to Williams that he try his luck, and to begin on suckers.

"Easiest thing in the world," he said, "to catch suckers." And he explained how it was done.

Williams could never have any luck fishing, but it appeared so easy to catch suckers he thought he would try it. "I'll play a trick on my wife," he said to Walker. "I'll slip quietly out of bed in the morning without disturbing her, and bring back a string for breakfast."

So he harvested a can of angle worms. It was a raw, cold spring morning, with a drizzling rain, and the comfortable bed nearly upset Williams's plans. When he arrived at the meeting place Walker was there with line set. The plan was to fasten a number of small hooks on short strings to the end of the main line, weight the whole thing and drop them into the river, the other end tied to a stick stuck into the earth. The sucker would come nosing along on the river bottom, suck in the bait, and all you had to do was to pull in the fish, for the sucker is a very docile creature. Walker stood with his hands in his pockets, watching the stick. "Easiest thing in the world," he remarked. "Sometimes I catch two or three at once."

Williams had an unpleasant task stringing the worms on the hook. His fingers got cold and numb, and the hooks would tangle up. He would whip his hands around his body, blow on them, press them between his legs, and then renew his task. In tossing the weight into the water one of the hooks caught in his clothes. Walker had already pulled in a nice, fat sucker. "Easiest thing in the world," he remarked again.

If Williams had been an experienced fisherman he would have heaved the weight into the water first and set the stick last. That was a serious error. The sinker, given a strong throw, fell well out into the water; the line came taut, pulling the stick out of the earth, and as it was going into the river Williams made a rush for it, barely missing it, when the soft bank went from under his feet, and he dropped into the water up to his neck. Walker fished him out.

"Easiest thing in the world to catch suckers," he sputtered, as he started on a run for home. E. P. M.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Game Bag and Gun.

Reminiscences of an Old Sportsman.—X.

(Continued from page 104.)

WE were shooting quail in the wilds of North Carolina, and were passing through a pine thicket when we heard a short distance ahead of us a shot, and immediately following the report the air was filled with ki-yings and shrill howlings of a dog that appeared to be getting away from there, as the music was gradually receding. We were soon at the edge of the thicket, where we found a long, gaunt native leaning on his long, gaunt gun, and looking in the direction that the dog had evidently gone. Approaching, I asked him what was up. He turned to us with a countenance that was a study to see, the predominating expression appearing to be a sort of surprised wonder; and as he shifted his rest from one foot to the other he slowly drawled out, "Trouble enough, Mister. Whatever the old woman will do when I get home I don't know; she thinks a heap of that pup."

"What!" I exclaimed in a tone of horror, "you did not shoot the dog!"

Rolling his eyes up at me with a woe-begone expression that would have been worth thousands of dollars to Fritz when he lost Schneider, "Oh, Mister," he whined, "don't talk like that. I feel bad enough now to go and jump in the creek. Whatever she'll do I don't know."

In response to my inquiry as to how it happened, he exclaimed: "Drat the old woman; she's as much to blame as me, for I shouldn't have come if she hadn't made me." Then dropping his voice to its natural tone he continued, "We were out of bacon and meat, and she allowed that I had better go out and get an old b'ar, so I got the gun and took Juke and came over here, as there is right smart of old b'ars here. Pretty soon I seen the purp wagglin' his tail, and I pulled foot for this corner, as they always run here. Well, pretty soon he done jumped one, and as it came out of the brush I whistled, and as soon as he squat I pulled on him, and I'll be everlastingly conswaggled if I didn't shoot the purp. Must have done broke his hindleg, I reckon, as he held it up and yelled like all possessed and started for home just as fast as he could go on three legs."

Then shouldering arms he went and picked up the "old b'ar," adding as he moved away, "Whatever she'll do I don't know, but I reckon I'd better go and have it out."

Several phases of this incident were quite interesting. I was particularly struck with the new word, "conswaggled." This was the first time that I had ever heard it, and my companion was in the same fix, so we argued a while and then tried to guess at its meaning, but had to give it up. Soon after we came across an aged "man and brother" who was plowing in wheat, and we agreed to abide by his decision. Approaching him, I gave him "good-day," and asked him if he would solve for us a linguistic problem. He had stopped his mule, and appeared to be good and ready for social converse, but when the unknown word fell upon his ear there came a dazed look upon his open countenance, in an absent-minded manner he pulled off his hat, and like the lone fisherman "he scratched his ancient poll," then dubiously shaking it, in a regretful tone he said, "No, boss, I dun know whar you'll find 'em, dar ain't none round here, but over under dat bush dar's an ole b'ar, an' he's done bene squattin' dar all day."

Promising to shoot the "ole b'ar" for him if he would answer a simple question, he brightened up and gave a fair promise. "Now," said I, "tell me truly, what does conswaggled mean?" I shall always be pleased to think that I asked him, for I now know what it means as well as any one, and in the interest of science I will record his answer. Rolling up his eyes and looking me straight in the face with a perfectly truthful expression he exclaimed, "Say, boss, I'll done be everlastingly conswaggled if I know."

We were paddling down the Pearl River in Mississippi in search of ducks. My companion was in one end of the boat and I in the other, each with a paddle, which we used alternately at each shot, turning the boat around so as to place the one whose turn it was to shoot in the bow, or as my companion put it, "shooting, turn and turn about." It was my turn at the gun when a mallard jumped a short distance below, and I blazed away, hitting him hard; but he kept on, and we saw him pitch down just beyond the bank at a bend in the river some twenty rods below. When we arrived at the place we drew the boat ashore and worked our way through the tangled brush a short distance, when we came to a small pond-hole, in the middle of which I saw a duck, and taking a hasty aim I let drive and tumbled him over. But after kicking a moment he partly recovered and paddled straight toward us. Coming out of the water and waddling up within 3 ft. he keeled over on his back in front of us. He was my meat.

I wish I could stop here, but this is not all the story. Before the duck was out of the water I saw that he was not the one we had marked down, and I told my companion that I thought this was a tame one; and as we just then caught sight of an aged darky hobbling toward us we knew it for certain. As he came up to us with his face wreathed in smiles, he very pleasantly said, "Well, gemmen, you's done killed de las' one, an' I specs you's 'll be willin' to gib me a quarter for him; dat's what all de gemmens pays me, and dey's done shot more'n sebenteen ob 'em."

Of course I at once forked over the quarter, for which I received at least \$2 worth of thanks, and then the old fellow proceeded to give us at length graphic and circumstantial accounts of the taking off of his flock, and to my horror giving the names of those who had participated in the sport. Some of the persons named were friends of mine, and I want to say to them right here that I have my opinion of any one who would be guilty of shooting the poor old fellow's ducks, but in order that they may have time for repentance I shall not at

present give them away. I was thankful that the old darky did not know us, and I was determined that he should not have our names to add to his list. My companion evidently thought the same, for when the old fellow wanted to know what our names might be he received a very prompt reply that we were the Fugerson brothers from New Orleans, and under threat that if he told on us we would never shoot another of his ducks he solemnly promised never to mention it. Picking up our "boughten" duck, we found the other one after a short search, and were soon in the boat floating calmly down the beautiful river, with never a word to break the peaceful quiet, and save an occasional stealthy glance at that dead duck not a motion to disturb the harmony of the scene or ruffle the surface of the bright water.

SHADOW.

[TO BE CONTINUED.]

That Boy Again.

Editor Forest and Stream:

In my mail box the other day was a letter. The name began about where it ought to on the envelope, but started toward the upper right-hand corner, so the stamp had to be put on skew-yaw to prevent its covering the name. The matter was remedied by running the next address line down to the lower right-hand corner. The city name was squeezed into the wedge-shaped space remaining, and the State's initials were over in the lower left corner out of the way.

It was thrilling handwriting, too, for me. I knew what to expect. Perhaps the mail clerks were thrilled as well. The letter was from the boy at Philadelphia, N. Y., of whose bicycle hunting the FOREST AND STREAM has told. A part of the letter may be worth transcription:

"You know sometimes a fellow feels kind-a funny. He don't want to read; he can't study; he fidgets sitting still, and gets out of breath doing nuthin. That's the way I got to feelin' the other day when it snowed and blowed so. I stood up to sit down ag'in, and monkeyed around home till Cousin Min was most strackted. She begun to fidget, too, and by and by I went hunting. Of course I took the target pistol and sort of moseyed off across the trestle to kind-a quiet myself down. I kept a-goin' and goin' up the railroad track, snow blowing so I couldn't see my feet walk. I piled over a fence and slid down them rocks top the hill by the sawmill still-water, and in them woods where there is an opening I found two rocks side-a-side, and between them was a fine place to sit down; so I sot. There wa'n't no wind there, and I was all het up and didn't git cool a bit. I had a place to lean my back against, and I rested with my eyes most shut. The snow dropped onto my face and felt bully, almost like home. Pretty quick there wasn't anything but snow where I was, all covered up."

"I kind-a went to sleep—wasn't cold, you know, just comfortable. My pistol was in my hand all snowy, my black wool gloves all white; couldn't see my shoes nor nothin'. I had some chocolate creams, and I ate them with snow—better'n ice cream—takin' care not to shake the snow down my neck. It kept gettin' shadowy all the time, flocks of flakes comin' down thick."

"I felt just like—I don't know. You know, I didn't want nothin' at all. Anyhow, it was lovely."

"I couldn't see across the river forty rods, only just shadows like in a balsam swamp. It felt shivery, too—not cold, only nice like. Pretty soon I kinder felt as though something was somewhere. I could sort of feel it, and I shivered. Couldn't see nothin' nor hear it. It seemed like the pistol was a comfort, too. Hadn't wanted it before, but it felt good in my hand. I held it a leetle tighter, not moving any at all. Someway I couldn't move."

"Then all to once a little black nose came from behind the right side rock I was sitting at. And it was long and p'inted, and there was eyes and a head and pricked-up ears. There was a full-grown fox standing there, stopped all to a standstill. Gee! I must have smelled strong that clost."

"Up went his head. I never moved. My eyes was shut all but the blinkers. He looked and looked. The snow whirled over the rocks and hit both sides of him, and he turned first one side, then t'other, smellin' and listenin'. Then away off across the river I heard one of the Cross boys holler "Whooee!" and the fox he heard, too, and turned the back of his head square to me."

"I lifted the pistol careful, careful, as though 'twould melt or bu'st or somethin'. It growed awful shadowy all of a sudden. It was most night, and it come like in a swamp, where it's evergreen and thick. I shivered, too, like as if I was scared, only I wasn't. I lifted the pistol. I could see the brass sinking into the steel, creeping up his forelegs—all I could see—up, up into his shoulder, and there it rested just a little second. Then, spank! went the little .22 short smokeless, the sound hittin' against the snow what was fallin' and huddlin' all up."

"The fox give a jump, and then half a one; down he went; kicked a little. Then he was dead, and me holdin' him up by the heels, letting the red blood drop out his breast. The bullet went in kittercoterin'."

"I took him home, and it was dark before I got there a long time. I didn't walk fast, but slow. It was one of those thinking spells a feller has coming home or something once in a while. I'm going to send it to have it mounted. It is a lovely skin, soft and nice. Poor devil! I felt sorry for him, getting cold in the snow so sudden."

And that's the way he got his first fox.

NEW YORK.

RAYMOND S. SPEARS.

Shooting on the Eastern Shore.

CHINCOTEAGUE, Va., Jan. 31.—Ducks are quite plentiful in Chincoteague Bay at this writing, especially redheads, broadbill and quite some brant. Mr. Joshua Reed, Jr., reports having killed thirty redheads at three shots on Saturday, and is shipping to-day thirty-six pairs, the result of Saturday's work. Brant will be on hand in February and March, on their northern flight, while geese may be expected.

T. G. ELLIOTT.

Interstate Wardens' Convention.

Monday, First Day.

CHICAGO, Ill., Feb. —The so-called Interstate Wardens' Convention, which began at Chicago to-day, is really not merely a convention of wardens, but a gathering of State committees charged with the investigation of protective measures calculated to be mutually beneficial to all the States represented. As stated earlier, the matter was first set on foot by Senator J. Herbert Green, of Milwaukee, Wis., a young and enthusiastic sportsman who has gained the confidence of many men and many interests of his State. Delegations were appointed by Legislatures of other States, so that quite a body of workers appeared to-day. The representation as shown at call for credentials to-day was as follows:

From Wisconsin: Hon. J. Herbert Green, James El-larson, State Game and Fish Warden; Henry Overbeck, Jr., Sturgeon Bay; W. H. Flett, Merrill; J. J. Hogan, La Crosse; H. D. Smith, Appleton; Curr Bell, Bayfield; E. E. Bryant, Madison; Calvart Spencely, Mineral Point; A. E. Birge, Madison.

From Minnesota: Executive Agent S. F. Fullerton, St. Paul; C. S. Benson, St. Cloud, Secretary State Fish and Game Commission; Senator E. G. Potter, Minneapolis; Hon. W. B. Douglas, Moorhead; Hon. T. E. Byrnes, Minneapolis, legal counsel of the State Commission; Hon. A. F. Ferris, Brainerd; Mr. Uri L. Lamphrey, President State Sportsmen's Game and Fish Protective Association, and Mr. G. L. Tucker, secretary of the same body.

From Michigan: Senator Preston, of Lapere; Hon. F. C. Chamberlain, Gogebic; Hon. Horace Davis, President of the State Fish Commission; Mr. C. E. Brewster, deputy warden, Grand Rapids; Col. E. Crofton Fox and Mr. John Waddell, of the Grand Rapids Sportsmen's Association; Mr. A. L. Lakey, President of the National Game, Bird and Fish Protective Association, Grand Rapids.

From Ohio: State Commissioner E. H. Shorb, of Van Wert.

From North Dakota: State Game Warden George E. Bowers, of Fargo.

From Illinois: Dr. S. P. Bartlett, United States Fish Commission; Hon. Nat H. Cohen, President Illinois State Fish Commission; Hons. John A. Barnes and J. B. Lyon, of the State Legislature; Harry W. Loveday, State Game Warden; M. R. Bortree, of the National G., B. and F. P. Association; Col. C. E. Felton (named but not present), of the Illinois State Sportsmen's Association; Messrs. C. D. Gammon and A. A. Exline.

Indiana, Iowa and South Dakota had no representatives present to-day, these States having made no appropriation for the purpose of sending representatives. Other delegates and interested persons are expected in to-morrow from Wisconsin and Michigan.

The convention went into business session at 2 P. M., at the club rooms of the Great Northern Hotel. Senator Green, of Wisconsin, was called to the chair, and Agent Fullerton, of Minnesota, was chosen secretary. The chairman stated the purposes of the meeting in a brief and direct speech which showed a pleasing freedom from high-flown generalities. On motion of Mr. Bortree the call of delegates was had, and a committee was appointed to formulate topics for discussion. Said committee, appointed by the chair, was composed of Messrs. Bortree and Loveday, of Illinois; Douglas, of Minnesota; Brewster, of Michigan; Flett, of Wisconsin, with the president and secretary of the convention. After a five minutes' recess the committee reported a programme beginning with fish protection, the discussion being:

1. Should inshore fishing be allowed on any of our Great Lakes?

Uniform Close Season on the Great Lakes.

This topic, not of such interest to sportsmen, is a vital one to the State wardens and commissions. Its discussion consumed a couple of hours. Dr. Bartlett, of Illinois, said Illinois was not so much concerned with the Great Lakes, but was in line for accord. Mr. Brewster, of Michigan, said inshore fishing should certainly have restrictions. Mr. Ferris, of Minnesota, thought Minnesota was not much concerned in the Great Lakes fisheries. Mr. Overbeck, of Wisconsin, said his State had a great deal of that sort of fishing. Mr. Fullerton, of Minnesota, showed the damage to schooling fish, immature ones, which ran inshore and were taken in inshore nets. Mr. Bartlett said he could promise the hearty co-operation of Illinois and the passage of any law his friends from outside advised. Mr. Brewster explained that, under the present diversity of the laws, they had driven the inshore fishers from Michigan, but they went to Indiana and Wisconsin and thence plied their trade on Michigan's coast. Had all these States a uniform measure, these fishermen could be forced to observe it, as they would have no haven. Mr. Fullerton thought no nets should be allowed nearer than one mile from shore. Very much more discussion of a general nature was had, and the interchange of information and ideas as to the spawning season of different fishes in different parts of the Great Lakes system was interesting and valuable. To bring it all into definite form Senator Potter, of Minnesota, introduced a formal motion, which after two amendments, a motion to reconsider and a thorough canvassing all around, was passed as the sense of the meeting in the following form:

"Resolved, That it is the sense of this meeting that trout and whitefish fishing be prohibited in the Great Lakes during the spawning season, being from Oct. 15 to Dec. 1." This was the joint determination of the convention, after sober and intelligent weighing of all the matter, and it is probably a wise one. The dates do not cover all the spawning of the lower and warmer lakes (Mr. Shorb, of Ohio, wishing the date to begin Sept. 15 for Lake Erie), but they are about as wide as would have chance of passage in all the States interested. Already the idea of broad, compromising, give-and-take, but uniform, laws was seen to be clearly in the mind of the majority of those present.

Uniformity in Market Size of Fish.

Discussion was now turned to the resolution introduced by President Nat H. Cohen, of the Illinois Commission, touching upon the marketable size of fish, as

shown in the new Illinois fish law. The veteran Dr. Bartlett, of Illinois, arose to say that he thought the size-limit law the most practical thing Illinois had yet found, and that he could here see and could instance the value of uniform laws.

"I have seen barrels full of 5in. bass," he said, "and if we try to prosecute, the dealers tell us that they come from Wisconsin or from Michigan. Make the size of sale the same in all these States."

Mr. Douglas, of Minnesota, said he would like to see black bass and trout taken off the selling list. They could not legally be sold in Minnesota. Dr. Bartlett agreed that that was right, but said no such measure could be passed for Illinois. Mr. Douglas, therefore, did not press this point for the general resolution. The best of feeling obviously prevailed, and the desire was manifest to sanction only the broadest measure which seemed feasible for all. A long time was spent in earnest discussion of the Cohen resolution, which was finally passed in the following amended form:

"Resolved, That this convention, and each member thereof, use all honorable means to secure the enforcement, in all States practicable, of laws for the protection of fish as follows:

"To prohibit the capture of any fish with hook and line, or by any device or means, within 400ft. from any dam, during the period from April 1 to July 1, in each year consecutively for five years next following.

"To prohibit sale of fish in markets of the kinds less than the sizes as follows: Black bass, 11in.; white bass, 8in.; rock bass, 6in.; black or river crappie, 8in.; white crappie, 8in.; yellow or ring perch, 7in.; wall-eyed pike (pike-perch), 15in.; pike, pickerel, 18in.; buffalo, 15in.; German carp, 13in.; native carp, 12in.; sunfish, 6in.; red-eyed perch, 6in.; catfish, 13in.; white perch, 10in.; brook trout, California trout, grayling, German trout, 6in.; landlocked salmon, 10in.; whitefish and lake trout, 2lbs. in the round undressed, or 1½lbs. dressed with head on."

This was the second measure, and it is also good. It covers matters already embodied in the laws of Illinois and Minnesota, and which might well be in the laws of all these Northwestern States.

Uniform Measures on Game.

The above closed the action on fish protective matters, it being now seen that the States intend using the size-limit to supplement the close-season idea on fish. The committee on topics now withdrew for further discussion and reported on their return the following topics for consideration, under the head of Protection of Game, with the following men to lead the discussion respectively:

1. Hunters' licenses. Ellarson, of Wisconsin.
2. Sale of game. Bortree, of Illinois.
3. Shipment of game. Fullerton, of Minnesota.
4. National legislation. Douglas, of Minnesota.
5. Cold storage. Loveday, of Illinois.
6. Spring shooting. Lakey, of Michigan.
7. Open and close seasons. Bartlett, of Illinois.

The license question was one of many theories. Mr. Ellarson, of Wisconsin, spoke but briefly. Mr. Bortree, of Illinois, thought non-resident licenses a necessity, else our game was to be wiped out. He would even favor a county license, so that any man going out of his own county would be obliged to pay \$2. Mr. Loveday, of Illinois, said it should not be all asked of the sportsmen. In his work he had found that 80 per cent. of the convictions were against farmers. They were the ones who were shipping the game. Mr. Davis, of Michigan, said it was time shooters of all sorts realized that killing of the State's game was a privilege, and not a right. The latter idea was amplified by Mr. Flett when he said:

"We have tried the hunting license, resident and non-resident, and I think I can say Wisconsin will never go back to the old way again. Once you eradicate the idea from the farmer's mind that the game belongs to the landowner, and not to the State, you will have easy sailing. We found it so in Wisconsin. The farmers came in thousands to pay their licenses to shoot deer. Our license law has worked so well that we may extend it also to feathered game."

Mr. Brewster, of Michigan, said: "The idea is often advanced that a non-resident hunting license is discrimination. It does not appear such to us. The non-resident pays nothing for the support and protection of our game, whereas the resident is taxed for the machinery of the government which he chooses to visit uninvited. His license only equalizes things. We got from our licenses \$7,000 for our State warden work, and as much for the counties. I can say, too, that after trying it with the license we will never go back to the old system again."

At this point Mr. William Werner, of Chicago, arose and created much interest and laughter by a stirring speech which had many hard hits in it. Mr. Werner said that the biggest game hogs on earth were the sportsmen of Chicago; they were the worst law-breakers, and bought most of the illegal game. He said that he was steward in a large restaurant in Chicago, and last summer sold an illegal prairie chicken to a certain sportsman of Chicago. For this he was fined \$13 [laughter]. Mr. Werner now grew warm, and stated some home truths. "I know it very well," said he, "from my own business, that Chicago sells game 365 days in the year—cold-storage game, unfit to eat—but it is sold. Don't blame the farmer, Mr. Loveday. You have plenty of pot-hunters here in Chicago. Our cold-storage houses are full of game to-day. My friend has followed me, and now I am going to follow him!"

Mr. Werner was received with applause, though speaking a bit ahead of the schedule of topics. The meeting adjourned at 6 P. M. to meet the following day at 10 A. M.

Character of the Meeting.

The character of the meeting to-day was a surprise and a delight to those acquainted with the vague verbiages of most alleged or pretended protective meetings. The orator was absent, and the business man, the thinker, the executive man, was present in his stead. The chair was lenient in rulings, and the discussion was not held down hard and fast, but was broad and generous in treatment. The presence of so many men ac-

customed to legislative action and parliamentary practice—lawyers, representatives and men accustomed to legislative committee work—was pleasantly shown by the courtesy and promptness of handling the business, and above all by the grasp and grip on the subject. Nobody wandered away and got lost. The main idea was always plainly before the house. Above all, one carried away the unusual impression that finally here were men the majority of whom were not seeking self-advertising or a "record," who were not trying to fill in the hours of a sportsmen's convention with the customary platitudes, but trying to do something for the practical protection of our fish and game. It was a serious, dignified and highly satisfactory meeting that was held to-day.

Tuesday, Second Day, Feb. 8.

Chairman Green called the convention to order at 10 o'clock in the morning. The order of the day was the consideration of measures protecting game, the question of fish protection having been thoroughly handled on the day before. The committee on order of procedure having made their report, Mr. Douglas, of Minnesota, introduced the following resolution:

Resolved, That it is the sense of this convention that a license tax of \$25 upon non-resident deer hunters, and a tax of \$1 upon resident deer hunters, similar to the laws of Wisconsin and Michigan, should be adopted by all Northwestern States.

Such a measure would at one time have been considered radical in the extreme, but the change of sentiment in the Northwest in this regard was clearly shown by a practically unanimous vote of these men who have given the matter serious thought before coming to this convention. Mr. Bortree, of Chicago; Messrs. Brewster, Lakey, Preston, Fox, of Michigan; Messrs. Whelan and Flett, of Wisconsin; Messrs. Potter, Tucker and others, of Minnesota, participated in the discussion of this interesting measure. The deer-shooting license for resident and non-resident may be considered as part of the policy of these Northwestern States. (It should, of course, be borne in mind that the terms "shooting license" or "gun license" do not mean the same as the "gun tax," which was at one time listed among the chimeras of certain Western protectionists. The gun tax would, no doubt, be an unconstitutional measure, even should it become a law, which would be most unlikely.)

An attempt was made to extend the license idea to cover all varieties of game, but Mr. Lakey's motion to this effect, making the non-resident license \$10, was lost, being tabled. Mr. Bortree declared it extravagant and impossible of success. Messrs. Foote and Preston, of Michigan, also thought that no such sweeping measure could carry. Mr. Ferris, of Minnesota, thought that not even a license for deer shooters would be paid by the residents of Minnesota, and moved to strike out the resident clause. Mr. Brewster opposed changing Mr. Douglas' motion, and so did Mr. Flett, of Wisconsin. The latter said the Wisconsin farmers did not object to paying \$1 for a deer license, and the law was a practical success. Mr. Potter, of Minnesota, differed from Mr. Ferris. He thought Minnesota could pass a \$1 deer license, but not a license covering general game. Mr. Whelan, of Wisconsin, made a strong speech, pointing out that a non-resident license practically implied a resident license also. Mr. Brewster said that he had received legal advice stating that a discriminating license would be declared unconstitutional. Mr. Flett pointed out that this license would be in effect a tax not upon the general public, but upon the men who wanted to go deer shooting. The results of that license fee would be a fund which would be used in the protection of the game. Thus those who danced would be paying the fiddler, and the fiddler would not be assessed upon any one else. It was further pointed out that for practical executive purposes a resident license was a necessity if convictions were to be made under the law. If some, and not all, deer hunters carried licenses in the woods, how could a warden tell whether a hunter who had no license was a resident hunter or a non-resident posing as a resident hunter? Mr. Ferris' amendment was lost, and the Douglas resolution was passed as offered.

The State's Property in Game.

Mr. Whelan, of Wisconsin, introduced the following resolution:

Resolved, That a law be passed by all the Northwestern States declaring all game the property of the States where game is found, before and after its killing, and that no one shall acquire any property rights in game, but it shall always be and remain in the State, subject to such laws as the different States shall pass.

Col. E. Crofton Fox, of Michigan, pointed out that the United States Supreme Court had already passed upon the question of the State's title in its game in the Bannock Indian cases. Mr. Douglas, of Minnesota, stated that statutes covering this point were already upon the books of different Western States and even so far East as Connecticut. These States had stolen the idea from Minnesota, which passed the first act of this nature eight years ago.

Mr. Whelan—"I am aware of these facts and am acquainted with the Bannock Indian case, but my measure goes further. The vital point is not that the State has its property right in the game before the killing, but after the killing. Here is where the enforcement of the law is concerned."

Mr. Exline, of Illinois—"The Illinois law does not go so far as Mr. Whelan wishes."

Mr. Byrnes, of Minnesota—"I can see that Mr. Whelan's measure is advanced ground, and the strongest yet taken. It means that the killer of game never becomes its owner and can never have more than a qualified possession. The effect of this in pursuing game into the hands of dealers in other States can readily be seen. I heartily advocate Mr. Whelan's resolution."

The resolution was carried.

Stop the Sale of Game.

Equally wise, though less positive, action was taken on the question of the sale of game. Mr. Brewster introduced a resolution prohibiting absolutely the sale of any game protected by law. It was the general belief that such a law could not be passed. Mr. Fullerton said that while he personally believed in just that doctrine, he was satisfied that so sweeping a measure could not be passed in Minnesota. "Let us begin with the thin edge of the

wedge," he said. Mr. Bortree was very positive, and came out flat-footed for stopping the sale of game altogether. He said that no one had a right to take State property and convert it to his individual use as a matter of commercial profit. He described strongly the iniquities of South Water street, and said that unless we could stop the sale of game all our laws must partially fail of their purpose. Mr. Loveday is known not to be in sympathy with the idea of stopping the game markets. He said that he believed in allowing a restricted sale at certain seasons. He was satisfied that so sweeping a measure as the one introduced could not be passed in Illinois. Mr. Brewster then, at Mr. Flett's suggestion, modified the wording of his resolution, in accordance with the thin end of the wedge idea, and it was passed in the following form:

Resolved, That it is the sense of this meeting that the several States here represented pass laws looking toward the final prohibition of the sale of all game protected by law.

The doctrine of FOREST AND STREAM grows in favor and in strength every year.

The Labeling of Game.

After adjournment for lunch the convention again went into session at 2 P. M., the first action being upon a resolution introduced by Mr. Whelan, of Wisconsin, as follows:

Resolved, That it is the sense of this convention that the Legislatures of the States here represented be urged to pass laws requiring persons to label packages delivered to common carriers so as to disclose the true contents of the packages, and the name and address of the owner or consignor, providing stringent penalties for falsely labeling such packages.

Resolved further, That Legislatures pass laws providing penalties for any agent, servant or employee of a common carrier who receives a package for shipment which is not labeled so as to disclose that the contents of the packages are game or fish protected by law.

This practical working measure was adopted with no opposition.

The Shipment of Game.

Mr. Brewster, of Michigan, introduced another effective idea in the following form:

Resolved, That the Legislatures of the Northwestern States be urged to enact a statute making it unlawful to ship into any of their respective States any game from any other State which forbids the shipment of game out of such State.

The wisdom of this mutual help among the States was apparent, and the convention indorsed the resolution unanimously.

The Following of Game.

Mr. Fullerton introduced a measure strengthening and extending the scope of Mr. Brewster's resolution. Mr. Douglas supported the resolution, explaining that the intention was that under the law a State could follow its property to any market. This measure, he said, would make back to the market hunter and would rob him of his market. "We are after that man," said Mr. Douglas, "who shoots, sells or ships game illegally." Mr. Whelan, of Wisconsin, suggested certain minor modifications of Mr. Fullerton's resolution, and the latter was passed in the following form:

Resolved, That the Legislatures of the States here represented be urged to enact laws by which the game wardens of each State shall be the agents of every other State to seize contraband game from other States, and that the title to such fish and game be recognized in the State from which the shipment is made, and disposed of according to the provisions of law in that State; the game wardens to transmit to the authorities of the State from which the shipment is made the surplus remaining after the expenses of seizure.

The foregoing little resolution is innocent at first glance, but if it were upon the statute books of all the Western States it would give the law-breakers of South Water street such a shaking up as they have never had. Speed the day when it may become a law. We shall then see emissaries from Mr. Fullerton, Mr. Ellarson and Mr. Osborne here on South Water street, each in search of certain lots of game such as hertofore has come to Chicago mysteriously, but always in abundance. No one can compute how much Chicago, New York and Boston markets have stolen from the property of the States of Minnesota, Wisconsin and Michigan.

How About New York?

Mr. Bortree introduced a resolution, which was passed, memorializing the State Legislature of New York to repeal the obnoxious Sec. 249 of the game laws of New York, which section opens the markets of New York to game throughout the close seasons of many Western States. "So long as this section shall remain upon your statute books," recites this memorial, "it will continue impossible for other States to prevent the unlawful taking and shipping of their game to your State. In expressing this hope we voice the spirit of the great mass of sportsmen of the West."

The Cold Storage of Game.

The important question of cold storage came up for thorough ventilation. State Warden Loveday, of Illinois, was called for upon this topic, and said that he did not believe in cold storage, but that we must accept it in limited and modified form. We must not interfere with the markets too much. What we ought to do was to enforce our shooting laws out in the country. Mr. Bortree's voice was still for war. He cited the Kewanee case, where 27,000 head of game was uncovered (and covered up again!) in a freezer, and gave further figures on this line. Mr. Werner, the steward of a large restaurant here, who created such interest yesterday with his charges against the dealers and others in this city, again excited a stir when he spoke of what he knew to be the case right here in Chicago now, after the close of the selling season. "I can show you a thousand saddles of venison in cold storage here to-day," he said. "I know how this goes, for I have bought game enough in my time. I have had quail offered me at 50 cents a dozen—what they call No. 2 quail. I have had them offered at 65 cents a dozen, and prairie chickens at \$1 a dozen." The market was glutted at times, and the game deteriorated in the course of years. It was not fit to eat after it had been long in storage. If the farmers only knew it, they would be better off if they passed laws stopping the sale of game, for then their chickens and ducks would not be competing with their quail and grouse in the market. Mr. Werner does indeed know

the business of cold storage here, and let us hope that he will carry out his expressed intention of going after the "street." Bill Werner may in his time have sold many a sooner chicken or later quail (perhaps to "sportsmen"), but his heart as a sportsman is in the right place. "Now, even if it should lose me my job," he declared, "I am going after some of these men I know."

The convention adopted no sweeping or high-flown expression of intentions on this head, but went on record plainly in form of a motion offered by Mr. Bortree, which was passed as follows:

Resolved, That this convention is of opinion that the cold storage of wild game is one of the most conclusive methods of assisting in the utter extermination of our game, and should be prohibited in all States by the most stringent laws.

The Spring Shooting of Game.

On the question of spring shooting to-day there is everywhere a consensus of belief among all sportsmen entitled to be called in the line of advanced modern thought on matters of protection. The game is passing away so rapidly that it seems easy to see that it should not be shot during the spring season. The record of this convention of thinkers—the most able, and yet one of the most wise, deliberate and conservative bodies that ever sat in this part of the country for the discussion of game law matters—hardly need be written, for it must be known without saying. The matter was inaugurated by Mr. Uri L. Lamphrey, President of the Minnesota State Sportsmen's Association, who made a stirring, logical and convincing speech. Mr. Lamphrey gave page and line for every position, and showed a thorough familiarity with the breeding habits and the dates of the flight of our migratory fowl. The formal resolution was introduced by Mr. Fullerton, of Minnesota, as follows:

Resolved, That it is the sense of this convention that the shooting of all aquatic fowl, including snipe, should be prohibited from Jan. 1 to Sept. 1 in each year, and that we pledge ourselves to use all honorable means to have laws passed by the different States here represented to so prohibit spring shooting.

It will be observed that this wording specifies snipe, so that there might be avoided the Illinois ambiguity over the question whether or not the snipe may be called a waterfowl.

The Seasons for Killing Game.

The question of establishing uniform open seasons for game over territory so large as that embraced by the different States represented in this convention is, of course, a very difficult one, and was alike the most important and the most trying duty of the convention. The discussion of dates for different sorts of game showed a disposition on the part of all the varying localities to give and take in the matter of close and open seasons, with the joint wish to get at dates which should be as near as possible alike, and which should yet serve the purposes of practical local protection. The first and least difficult phase of this question was that of the season for deer in the different States. After careful weighing of all data, the following resolution of Mr. Foote, of Michigan, was adopted:

Resolved, That it is the sense of this meeting that the open season for deer be from Nov. 1 to Nov. 20, with five days to dispose of the deer on hand.

The question of a uniform date for chicken, quail, grouse, etc., proved to be a mixed and hard one, and bid fair to take up much more time than remained at the disposal of the convention. Here it became obvious that Illinois will without doubt prove the most disturbing factor in any attempt at uniform laws among the Northwestern States. This is true mainly from geographical reasons, the State stretching nearly 300 miles further south than the average boundary lines of the other States concerned. Mr. Loveday thought the chicken date ought to be opened on Sept. 15; Col. Fox, of Michigan, thought that the date on all game birds excepting prairie chickens should be from Oct. 1 to Dec. 1. It seems to be evident also that the prairie chicken is going to be a harder factor to handle than almost any other game bird. Mr. Fullerton, seeing that these questions needed further weighing, moved that the chair appoint a committee to be composed of one delegate from each State, these to meet later with the purpose of determining dates as uniform as possible for the seasons on small game. This motion prevailed, and the chair appointed the following committee: Minnesota, S. F. Fullerton; North Dakota, George E. Bowers; Michigan, A. L. Lakey; Wisconsin, J. H. Green; Ohio, E. H. Shorb; Illinois, C. E. Felton. The report of this committee will be received with interest after it has formulated its plans.

Song and Insectivorous Birds.

Mr. Ruthven Deane, the well-known Chicago ornithologist, took up the question of protection of North American birds, explaining the failures of certain laws in the practical protection of such birds. He mentioned the work of the Audubon societies of different States, and described the necessity for such work. He spoke of the practical extinction of certain of our North American birds, and traversed the popular doctrine that hawks, crows, etc., should be destroyed when seen. Mr. Deane offered as proper text for an interstate law the following bill prepared by the American Ornithologists' Union:

[An Act for the Protection of Birds and their Nests and Eggs.]

Sec. 1. Any person who shall, within the State of —, kill or catch or have in his or her possession, living or dead, any wild bird other than a game bird, or who shall purchase, offer or expose for sale any such wild bird after it has been killed or caught, shall, for each offense, be subject to a fine of \$5 for each bird killed or caught, or had in possession living or dead, or imprisonment for ten days, or both, at the discretion of the court. For the purposes of this act the following only shall be considered game birds: The Anatidae, commonly known as swans, geese, brant, and river and sea ducks; the Rallidae, commonly known as rails, coots, mud hens and gallinules; the Limicolae, commonly known as shore birds, plovers, surf birds, snipe, woodcock, sandpipers, tattlers and curlews; the Gallinae, commonly known as wild turkeys, grouse, prairie chickens, pheasants, partridges and quail.

Sec. 2. Any person who shall, within the State of —, take or needlessly destroy the nest or the eggs of any wild bird, or shall have such nest or eggs in his or her possession, shall be subject for each offense to a fine of \$5, or imprisonment for ten days, or both, at the discretion of the court.

Sec. 3. Sections 1 and 2 of this act shall not apply to any person holding a certificate giving the right to take birds, and their nests and eggs, for scientific purposes, as provided for in Section 4 of this act.

Sec. 4. Certificates may be granted by (here follow the names of the persons, if any, duly authorized by this act to grant such

certificates), or by any incorporated society of natural history in the State, through such persons or officers as said society may designate, to any properly accredited person of the age of fifteen years or upward, permitting the holder thereof to collect birds, their nests or eggs, for strictly scientific purposes only. In order to obtain such certificate, the applicant for the same must present to the person or persons having the power to grant said certificate written testimonials from two well-known scientific men, certifying to the good character and fitness of said applicant to be intrusted with such privilege; must pay to said persons or officers \$1 to defray the necessary expenses attending the granting of such certificates; and must file with said persons or officers a properly executed bond in the sum of \$200, signed by two responsible citizens of the State as sureties. This bond shall be forfeited to the State, and the certificate become void, upon proof that the holder of such a certificate has killed any bird, or taken the nest or eggs of any bird, for other than the purposes named in Sections 3 and 4 of this act, and shall be further subject for each such offense to the penalties provided therefor in Sections 1 and 2 of this act.

Sec. 5. The certificates authorized by this act shall be in force for one year only from the date of their issue, and shall not be transferable.

Sec. 6. The English or European house sparrow (*Passer domesticus*) is not included among the birds protected by this act.

Sec. 7. All acts or parts of acts heretofore passed, inconsistent with or contrary to the provisions of this act, are hereby repealed.

Sec. 8. This act shall take effect upon its passage.

Mr. Watkins, of Michigan, supported Mr. Deane's remarks ably, and the above was passed in form of a resolution.

Other Matters.

Mr. E. H. Shorb, of the Ohio State Commission of Fish and Game, was called upon to tell something of his work as master of the State pheasantry in Ohio. Mr. Shorb said that he had found the cross-bred bird, or ring-necked pheasant, the most valuable, as it did not wander so much as the Mongolian pheasant. He stated that Ohio had been very successful in raising these birds, and he had turned down over 2,000 of them. The birds bred twice a year and were hardy when once the season of infancy was passed.

Col. Fox, of Michigan, introduced the following resolution, which was passed:

Whereas, This convention has been called for the purpose of recommending efficient laws for the protection of game of all kinds; be it

Resolved, That this convention urges Congress to use every honorable means to pass the bill proposed by Hon. Secretary Bliss for the addition of lands known as Jackson's Hole, in Wyoming, to the Yellowstone Park as a part of the same, for the purpose of better protecting the wild animals which abound in that section, thus making a winter range and the grandest game preserve in the world.

Mr. Lakey moved that the States of Indiana, Ohio, Iowa and South Dakota should be invited to join the purposes of the convention, and Senator Potter, of Minnesota, moved that the temporary organization formed for the present week should be made a permanent one. On vote upon the latter motion the organization was made permanent. Mr. Green, of Wisconsin, will continue as president, and Mr. Fullerton, of Minnesota, as secretary for the ensuing year. Annual meetings will be held. The name of the organization will be determined at a future committee meeting, and for the purposes of brevity the title of Interstate Wardens' Association may perhaps be adopted.

In the matter of national legislation, Mr. Fullerton introduced the following, which was carried:

Resolved, That it is the sense of this convention that each delegate present shall use his best effort with his representative in Congress to have him vote for and support the bill now pending in Congress, introduced by Senator Teller, to regulate the shipment of game between the States, and that we, as delegates, heartily concur in this proposed legislation and urge its adoption.

In the matter of shortening the selling season of game, Mr. Strell was of the belief that a selling season should be permitted, but that it should be bounded by subtracting five days from each end of the killing season. This was referred to the committee on open and close seasons.

The Committee on Legislation.

The sense of this convention may be clearly gathered from the foregoing resolutions as printed in full, and it is to be submitted that the conclusions of this convention are wise ones, and not radical from a modern standpoint. At least they represent the belief of the best protectionists of this part of our country. The work up to this point, however, has been but preliminary and advisory. The practical work is still ahead. It is no doubt too much to expect that any measure embodying the above principles will be passed by all of the States represented here in Chicago, nor is it, perhaps, to be supposed that even one State will adopt these suggestions in full. The task of preparing a bill which shall be common for all these States, on the heads above specified, is one involving much legal skill and careful thought. The necessity of a legislative committee was apparent for the purposes of drafting such a bill, and at Mr. Byrnes' motion the personnel of such a committee was decided by the chair as follows: J. H. Green, S. F. Fullerton, A. L. Lakey, George E. Bowers, E. H. Shorb and C. E. Felton.

This committee will have at its right hand such legal talent as that of Hon. T. E. Byrnes, who has had much to do with the excellent Minnesota law, and of Mr. C. E. Whelan, Assistant Attorney-General of Wisconsin, who for such purposes would need no further indorsement than may be shown in the brief record of his work at this convention.

The convention adjourned at a late hour on Tuesday afternoon, subject to call of Chairman Green. After the smoke has blown away from an ordinary sportsmen's convention one usually expects to hear nothing further of the matter, but there is a peculiar and irresistible feeling about this convention, which was not one of sportsmen, that its adjournment was not the end of it. It is the belief of all who attended this convention and noted its sincerity and steadfastness that we shall hear more from these men. Let us hope that it will be a great deal more.

Notes of the Convention.

There were present on Tuesday the following gentlemen from different States, a numerous and able gathering:

Wisconsin.—Senator J. H. Green, J. T. Ellarson, State warden; H. Overbeck, Jr., Representative W. H. Flett, H. D. Smith and J. J. Hogan, Fish Commissioners; C. E. Whelan, Assistant State's Attorney; J. S. Nevins, Superintendent, and E. E. Bryant, President State Fish Commission; C. G. Ball, Commissioner of Fisheries.

Minnesota.—S. F. Fullerton, executive agent State

Game and Fish Commission; Representative W. B. Douglas, chairman House Game and Fish Committee; Senator E. G. Potter, chairman Senate Game and Fish Committee; Hon. T. E. Byrnes, attorney for the State Commission; C. S. Benson, Secretary State Game and Fish Commission; Representative A. F. Ferris, member House Game and Fish Committee; Uri L. Lamphrey, President Minnesota Game and Fish Protective Association; W. G. L. Tucker, Secretary same organization.

Michigan.—Horace Davis, President State Fish Commission; C. E. Brewster, State deputy game and fish warden; Col. E. Crofton Fox, Vice-President State Game Protective Association; J. Waddell, Grand Rapids Fish, Game and Dog Protective Association; A. L. Lakey, President National Game, Bird and Fish Protective Association; Senator J. L. Preston, Mr. Moore, statistical agent Michigan Fish Commission; Representative C. E. Foote, and G. W. Wills, deputy from Bay county.

Illinois.—N. Cohen, President State Fish Commission; S. P. Bartlett, United States Fish Commissioner; Representative J. B. Lyon, H. W. Loveday, State warden; A. A. Exline, attorney for State warden; P. Goetter, A. Lenke, H. Edenborgh and G. R. Rotto, deputy game wardens; A. H. Noel, fish warden, Cherry Valley; C. D. Gammon, M. R. Bortree, S. F. Baird, G. Kleinman, G. Airey, E. M. Gates, William Werner, R. B. Organ, L. M. Hamline, Ruthven Deane.

Ohio.—E. H. Shorb, State Game and Fish Commissioner.

North Dakota.—George E. Bowers, State warden.

State Warden Chase S. Osborne, of Michigan, is on his way to Europe, and could not attend. Mr. Chamberlain, of Ironwood, was also disappointed and obliged to send regrets. State Deputies Brewster, Watkins and Willis ably represented the field forces of that progressive State.

Warden George E. Bowers, of North Dakota, says that the shooting license is well received in his State, and raises considerable money to pay for protective work. He thinks North Dakota will not go back to the old system again.

Mr. C. E. Whelan, of Wisconsin, is the sort of lawyer of whom protection cannot have too many.

Hon. "Tim" Byrnes, of Minnesota, has had great practical experience in drafting and enforcing game laws. Let us hope his hand may be seen in the important bill which shall represent the action of this convention.

A better man could not have been put in the secretary's chair as executive agent. He executes.

Illinois is the shakiest State of them all on cold storage and the sale of game. Illinois will not come into line on spring shooting. If there is any break out of the line of uniformity, it is most apt to come from Illinois. This State has a greater commercial interest in game than any or all of the Western States. Her geographical situation, running almost into the Southern States, makes yet another phase of the problem. These are reasons for the fact that Illinois is far behind all the other States represented here, and is most apt to stay behind in protective work.

But nothing is behind New York, with her destroying markets.

There will be a good sale of FOREST AND STREAM this week among the game dealers.

E. HOUGH.
1206 BOYCE BUILDING, Chicago.

Fox and Grouse.

CLINTON, Me., Jan. 31.—*Editor Forest and Stream:* In your issue of Jan. 1 the communication from Mr. Stephen R. Leonard, entitled "Foxes or Birds?" well illustrates the desire of a certain class of sportsmen to find a scapegoat on which to lay the consequences of their own deeds. He asks if I have viewed the subject from all sides. As I am very fond of grouse shooting as well as fox hunting, I have carefully considered the question from all sides and in all lights. As to having an oversupply of grouse in this neighborhood, I can say that there most certainly is not, but we must look for some other cause than the depredations of the red fox.

I have been in the woods a great deal during the past six years, and during that time I have only once seen where a fox has devoured a grouse, and I had no means of knowing that this bird had not died from a shot wound. I have never seen where a fox has caught a grouse that was under the snow for the night, and I am positive that it is very rarely that they do catch a bird in this way.

The Creator adjusted the workings of nature in far too wise a manner to allow one class of birds or animals to be exterminated by another class. It is only when the creature man devotes his superior powers to their destruction that the different classes of game are in danger of becoming extinct. According to old hunters with whom I have conversed, before the advent of the wing shooter with breech-loading gun and pointer or setter grouse were very plentiful and tame, and foxes were also much more abundant than at the present day. Since the advent of modern firearms, dogs and methods of shooting, the supply of ruffed grouse has steadily diminished.

In the season of 1897 very few, if any, ruffed grouse were raised in the State of Maine, owing to the continued wet weather at the time of hatching and afterward; yet, notwithstanding this, the woods have been full of hunters who have shot every grouse possible. I have made inquiries of a number of shooters, and all of the birds shot have been old ones. It is an undoubted fact that owing to no birds being raised the past season, and also to the slaughter of old birds, the beginning of the year 1898 finds less than one-fourth the usual number of grouse left for breeding purposes in this State. Next fall, when the continued scarcity of grouse becomes apparent, no doubt some sportsmen will ignore the true cause of this scarcity, and again we shall hear the old, familiar cry: "The fox did it."

To do the bird shooters of my section justice, however, they are very fair and do not claim that the fox is to blame for the scarcity of grouse, and all very willingly signed a petition which was presented at the last term of the Legislature, requesting the passage of a law preventing the trapping of foxes.

As to rabbits being in danger of being reduced to an alarming extent by foxes, that is the veriest nonsense. In this town, which is one of the towns in this State in which foxes have never been trapped, the fox is quite plentiful, and every swamp is full of rabbits, owing to their not being hunted to any extent. From these facts any honest, thinking man can deduct his own conclusions.

Viewing the question from a different standpoint, the fox is one of the wisest provisions in the whole economy of Mother Nature, as a means of keeping mice and certain kinds of insects in check. It is a well-known fact that the principal food of the fox is the field mouse, and that where the mouse is plentiful there will the fox be found in good numbers until the mice are caught off, when the fox moves to new pastures. The destruction of the coyote in certain sections of the Northwest has been followed by a plague of jack rabbits, and in Manitoba by a plague of gophers, or ground squirrels, and there is no doubt that the extermination of the fox would be attended by disastrous results, owing to the increase of mice and other pests. The worst natural enemies of the grouse are the great horned owl and the American goshawk, of which latter bird there has been an unusually large flight the past season.

It can be only the most pitiable selfishness which can induce any one to think that because one class of sportsmen are supposedly more numerous than those of another class, the smaller class has no rights which the larger class is bound to respect. I think that all fair-minded sportsmen will agree with me that the fox hunters as a class are as worthy of consideration as any other class.

WILLARD H. SULLIVAN.

Winter Convention, Illinois State Association.

PEORIA, Ill., Feb. 9.—To step from the Interstate Wardens' Convention of yesterday and the day previous to the winter convention of the Illinois State Sportsmen's Association at Peoria to-day was something like stepping from the nineteenth century back into the dark ages.

This is the first time in the history of the Illinois State Association that the convention has come out flat-footed for spring shooting, has fought every movement looking toward stopping spring shooting, and has looked grudgingly on such measures as would tend to limit the bag of game for any one day. Ordinarily we have at least resolved against spring shooting, but this time we didn't even resolve against it.

The State of Illinois, in so far as the State Sportsmen's Association is concerned, is cut into two sections. The upper third is not in favor of spring shooting, and has usually stood for strict game laws. The central and lower parts of the State are strong for spring shooting. Attending a convention at Peoria, in central Illinois, is like going outside of the State, so far as similarity to the views of the upper part of the State is concerned. The representation in the convention to-day was practically one from the central and lower portions of the State; hence the apparently contradictory action of the organization. Yet it should be said that the men from these lower sections are very frank and outspoken in their wishes, leaving nothing in doubt as to their intentions, and of course it should be understood that it is no new condition which has been discovered. There is no more hard feeling among the members from different parts of the State than there has ever been. On the question of spring shooting the Association has simply agreed to disagree. Barring certain wild schemes which the State Legislature will take care of very promptly when it gets around that far, the action of the convention may be said to indicate a certain progress in the ideas of game protection, though certainly not a progress such as that shown by the men who met at the wardens' convention this week in Chicago. There was a little less of the customary sweeping resolutions and a little greater indication of a possible later action upon some of the resolutions adopted. Let us say, then, that the great State of Illinois, with its double climate, its varying conditions, is still in the dark ages of protective work, but not nearly so far back in them as it was some years ago.

Summary of the Sense.

The sense of the meeting was taken by resolutions offered upon all the different questions of a list prepared and sent out among the members of the association, the answers being tabulated and further enforced by the discussion on and vote of the meeting. Thus we may succinctly arrive at the beliefs and preferences of the Illinois State Sportsmen's Association on matters of game protection by reference to the following summary:

1. Dates for the open season: Ducks, geese, snipe and water fowl, Sept. 1 to April 15; grouse and prairie chicken, Sept. 1 to Nov. 1; quail, Oct. 15 to Dec. 15; woodcock, Sept. 1 to Dec. 15; squirrel, Sept. 1 to Dec. 15; deer, wild turkeys and Mongolian pheasants, protected till 1910; doves, Sept. 1 to Dec. 15.
2. Should State game wardens be paid a stated salary? Yes.
3. Would it not be well to have a State fund for the payment of wardens and propagation and preservation of game? Yes.
4. How shall we obtain a fund for the payment of wardens for the protection of game? By a shooting license of \$1 for residents, \$5 for non-residents.
5. Should a limit be placed on the number of birds one person may kill in a day? Thirty-five head of any one kind of game in any one day.
6. Would it not be wise to pass a law prohibiting entirely the sale of game, excepting during the period between the fifth day after the opening of the open season and the fifth day before the closing of the open season? Yes.
7. Would it be wise to pass a law prohibiting entirely the cold storage of game? Yes, prohibiting cold storage for commercial purposes in any storehouse of temperature less than 32 degrees.
8. Would not the prohibiting of the cold storage of game and the sale of any game, from any State, at any period other than the time mentioned in Question 7, make it unprofitable for dealers and market hunters alike

to handle game, and thus take away the incentive to violate the game laws? Yes.

9. Would it not be wise to divide the State into eight game districts, with a paid district game warden in each, to look after the enforcement of the laws in his district? Advise one State warden with a deputy for each county.

10. Could you suggest any improvement in the present fish laws? No hook and line fishing within 400ft. of any dam from April 1 to July 1.

11. Should there be an open season on doves? If so, what dates? Yes, Sept. 1 to Dec. 15.

The Proceedings.

The meeting was called to order at the parlors of the Fey Hotel at 11 A. M., Vice-President Abner Price, of Chicago, in the chair, President Fahnestock, of Peoria, being absent in California; Secretary G. F. Simmons was at the desk. An address of welcome was delivered by Mayor Warner, of Peoria. On call of delegates the following clubs responded, with the following representation:

Peoria Gun Club—G. H. Portman, Robert D. Clarke, J. M. Brown, George F. Webber, William Ohl, Frank K. Whiting, Dan Raum, Robert Scholes.

Duck Island Hunting and Fishing Club—D. W. Voorhees, Peoria; Will Bush, Peoria; W. H. Shaw, Canton; Abner Price.

Henry Gun Club—J. S. Brassfield.

Aledo Gun Club—J. F. Henderson.

Canton Gun Club—A. J. McQuaid, W. H. Shaw.

Undercliffe and Lake Senachwine County—J. G. Reuter.

Pekin Gun Club—J. N. James.

Wyoming Gun Club—J. M. Thomas, Jr.

Chicago Fly-Casting Club—George W. Strell.

Crystal Lake Club, of Henderson County—E. H. Carpenter, of Burlington, Ia.

College City Hunting and Fishing Club—J. H. Pettibone, Burlington, Ia., and Carl Leopold, Burlington, Ia.

Lone Tree Fishing Club—J. H. Pettibone, Burlington, Ia.

Rice Lake Hunting Club—J. C. Thompson, Jr.

Carthage Lake Gun Club, of Henderson County—F. J. Schlager and J. C. Lathan, of Burlington, Ia.; S. P. Bartlett, United States Fish Commissioner, Quincy; McLean County Gun Club, Henry Ringhouse, Bloomington; L. W. Hurff, Elmwood, Ill.; W. H. Clinch, Elmwood; John Kelly, Peoria; Joseph Fargo, Benson; C. J. Sammis, Peoria; Charles Bartson, Peoria; W. E. Giles, Peoria; A. E. Giles, Peoria; W. C. Bush, Peoria; M. D. Hurley, Peoria; E. H. Bradley, M. D., Peoria; J. W. Henry, Galesburg; E. B. Davis, Galesburg; R. B. Organ, Chicago; H. W. Loveday, chief game warden, Chicago; Nath. H. Cohen, Fish Commissioner, Quincy; Dr. W. V. Gutterg, Middleton; A. L. Deaton, Middleton.

On motion all present were admitted to the discussions on matters before the convention.

A committee of two—Messrs. Robert Clark, of Peoria, and J. M. Thomas, of Wyoming—was set to work at tabulating the hundreds of answers to the printed lists of questions. The secretary read a letter of regrets from President Fahnestock. The latter inclosed a letter from Col. C. E. Felton, of Chicago, expressing at great length his own personal views upon game legislation. Col. Felton appears not to have been happy when he wrote the letter, for among other things he expressed extreme dissatisfaction with the sportsmen's papers, remarking in part: "When sportsmen try to injure legitimately the mercantile class they but furnish food with which to kill all really friendly legislation for the protection of game. Much better (were it possible or proper) to muzzle the sportsmen's press (so called, but not truthfully, as our papers are now but advertising mediums) and prohibit their advertising guns, ammunition, tournaments, etc., creating a desire to shoot birds. It is the greed for the almighty dollar on their part, which, more than a like number of market men, fosters the illegal killing of game. Preaching and practice with these journals are not in harmony."

Mr. Clark, of Peoria, asked: "Who is Mr. Felton?" Mr. Hough, of the FOREST AND STREAM, moved to table the letter of Col. Felton, Mr. Strell, of the American Field, seconding. Motion lost, Mr. Shaw, of Canton, substituting a vote of thanks, though the press couldn't see anything to be thankful over. Col. Felton didn't ought to do this, for the sporting papers have always treated him very nicely, as they do everybody else. If they should cease doing so, and start out after him some bright morning with a conjoint sharp stick, he would accumulate Weltschmerz faster than he hath dreamed. As I have stated earlier, the real trouble with Col. Felton is that he can't shoot well enough to kill himself a mess of birds, so he wants to be allowed to buy them; otherwise he is a nice man.

Uniform Opening Date.

When the committee on replies announced its willingness to report, it became evident that it would be difficult to classify the replies exactly. Thus on the question on the legal season for wildfowl twelve asked for Sept. 1 to April 15; twenty for Sept. 15 to April 1; twelve Sept. 15 to May 1; five Oct. 1 to April 1; four Sept. 1 to Jan. 1; six Sept. 1 to April 1; one Sept. 1 to Dec. 1; two Jan. 1 to March 15. One member of the Association sent in a reply stating that he did not want any game law at all! Several members of clubs living near the borders of other States where there was no spring shooting wanted the season to end Feb. 1. The closing part of the law was the important part in the minds of the Southern members, and as to the opening date they were not so insistent. On motion of Mr. W. H. Shaw, of Canton, the closing date was made April 15. A very excellent course was taken upon the action of Mr. Strell's motion to open the fall season on all feathered game at Sept. 1, so that no gun should go afield before that date for any reason or excuse. This was carried. The wisdom of such a date is apparent, as it means protection to July wood ducks and August grouse, which are so often killed under the cover of earlier open dates on other game, such as woodcock, etc. The closing date on quail, woodcock and squirrels was set for Dec. 15; on prairie chickens, Nov. 1.

Some time was spent over the discussion of a deer

law, Mr. Leonard, of Burlington, thinking that deer might again live with us in lower Illinois, at least if they had protection. The closed term indorsed, till 1910, is proper, but not vital. The question of rabbits proved far more important, and the farmer boy, the gun and the flock of quail on the snow came up for careful consideration. It was agreed that a rabbit law would raise a howl from all over the State, and therefore it was decided to leave the rabbit where he is now, an outlaw against whom every man's hand may be raised on sight.

It was wise to specify snipe instead of leaving alive the ambiguity of the present Illinois law, and it was wise to recommend uniformity of dates on snipe and ducks, so that the alleged snipe hunter may not shoot ducks, and vice versa. Mr. James, of Pekin, wanted snipe shooting to run into the spring as far as May 15, but his motion was lost.

The Mongolian Pheasant.

Dr. E. H. Bradley, of Peoria, brought up the question of propagation of the Mongolian pheasant, stating that such a bird would add much to our sporting resources. Mr. Carpenter thought results with this bird had been disappointing. Of many birds put down he had heard very little, and he thought they did not do well. Mr. Leopold begged leave to differ, as he had seen several of these birds, some as much as twenty miles from the place where they were put down, in Hancock and Henderson counties. He thought them well worth trying. Others spoke of the success with these birds in other States. On motion of Mr. Strell they were added for the close term till 1910. Let us hope that no future Governor will veto this measure.

New Ideas.

The new idea of salaried wardens, paid from a State fund, seemed to prevail in the convention, though it was agreed that any game law establishing a salary and not providing for the salary would be killed in the Legislature. On the question of raising such a fund the idea of the gun license was a natural sequence. It was voted that an annual shooting license of \$1 should be charged upon all residents wishing to shoot in Illinois, this not to be a gun tax, but a gun license, payable only by those who cared to shoot.

The Ring of Real Sportsmanship.

The ring of real sportsmanship was evident in the speech of Mr. Robert Scholes, who asked time for remarks on the question of putting a limit on the daily bag. Mr. Scholes said that twenty-five birds were enough for any man who is out for sport, and he took it that all members of the Association claimed to be sportsmen. The market hunter might want more birds than that, but he concluded that the day was past when market hunting could be tolerated by sportsmen. None of us were market hunters, he said. He moved a limit by law of twenty-five head of game to any one gun for one day.

Mr. Clark, of Peoria, was frankly and naively opposed to this. He thought fifty birds was nearer right. Suppose you have been out four or five days, and you get a good chance at last, he said; would it not be hard to quit with twenty-five birds when they were coming in good?

Mr. Shaw, of Canton, opposed the idea of so small a limit. He said, with frankness equal to Mr. Clark's: "I am one of those game hogs."

Mr. Hurff came out openly and said he did not believe in any limit at all on the bag. Mr. Leopold said he favored some sort of a limit. Mr. Clark moved to amend Mr. Scholes' motion by setting the limit at fifty head. Amendment lost, and Mr. Scholes' motion was carried. This action was done by a majority, but it left a very sore minority. Mr. Clark said that he believed such a measure would split the forces of the Association at the Legislature, as he could not indorse such a limit, and he knew a great many others would not. Mr. Leopold moved to reconsider. Motion reconsidered. Mr. Shaw then moved that the limit of bag should be "thirty-five head of any one kind of game on any one day." Thus, he explained, one might kill thirty-five ducks, thirty-five snipe, thirty-five chickens, etc., the same day. The Shaw motion carried and was made the sense of the convention.

The Marketing of Game.

Mr. Clark, of Peoria, voiced the opinion of the majority in his motion to admit a selling season for game, but limiting it by subtracting five days from each end of the shooting season. Mr. Strell supported this with others. He later introduced a resolution memorializing the Legislature to abolish cold storage of game. Mr. Shaw moved to table this, as it would affect the holding of sportsmen's game in ice houses. It was pointed out that the ice house and the commercial cold-storage house were not identical. Motion to table lost. The resolution was shaped to specify commercial cold storage. If the Legislature knows its duty it will now abolish the warehousing of game, which has hitherto been known to be a troublesome factor.

Districts.

On the question of districting the State Mr. Scholes said we must have funds before we could pay district wardens. He spoke of the light regard held for the law, citing the case of Sheriff Johnson, of that very city of Peoria, who had broken the chicken law last summer. To break a game law was as shameful as to break the law against burglary. Mr. Scholes made a strong speech in favor of good laws and good observance of them. Mr. Clark explained that Sheriff Johnson had thought Aug. 15 was the date. Mr. Scholes said it was no matter what he thought, he could easily have learned, as he had the statutes. Warden Poole stated that Sheriff Johnson had asked him what would be done if he went out shooting before the law was out. Warden Poole said he himself would do nothing, nor had he done anything, but he noticed that some other deputy had!

The question of districting the State was closed by the motion of Mr. Shaw, who favored a State warden and a deputy for each county.

Fish Laws.

S. P. Bartlett, of the United States Fish Commission,

was called upon to state what he needed in the way of a better fish law in Illinois. He replied that he was doing pretty well as it was, and did not grow enthusiastic over the idea of aid. He said that the State Commission had gotten its present law inch by inch, through a term of years, not by asking any sweeping measures, and that the law was kept on the statute books by means of a broad way of enforcing it. An attempt to enforce it to the letter might cause its repeal. He said he had worked fifteen years for the interests of the angler, and at last found he was wrong, and had come to consider the importance of the interests of commercial fisheries. He spoke for the carp and other coarse fish, saying that under no natural condition were the game fishes found to exist in a relation of more than 15 per cent. to the coarse fishes. To increase the latter increased the former. Dr. Bartlett approved of the new fish law with its size-limit on fish. He also favored the pet idea of President Nat H. Cohen, that no fishing should be allowed within 400ft. of any dam from April 1 to July 1. He spoke of great destruction of spawn-laden bass he had seen caused by hook and line in the spring. He had seen one rod kill 150 bass in one day, and had known a lot of boys to take 1,400 black bass on hook and line. We needed a close season, covering the spawning season, but this was hard to establish for so long a State as Illinois. Dr. Bartlett did not believe in paying wardens by a "blood money" system of fines. He admitted, on Mr. Kelly's question, that the Commission allowed net fishing under the ice, against the law, but said it was only for coarse fish, and was done under the supervision of a State deputy, whose pay came from the fishermen. He gave further instance of the odd Western view of the law and its enforcement by admitting that the Commission tolerated $1\frac{3}{4}$ in. mesh nets, against the law, but said that if they lived up to the law the market fishermen would be injured. He believed that the best way was to have an understanding with the market fishers. The latter had about 1,000 men in their association, and that this association would vote for a law imposing a license of \$100 for each firm, this fund to go for the use of protection. During his speech Dr. Bartlett was plied with questions, and this but served to show his thorough familiarity with his work. In the matters of knowledge of fish, of fish conditions, of getting legislation, the amateur sportsmen of the Association are babes and sucklings compared to this veteran, and I imagine he felt glad when he discovered no disposition for extensive tinkering with the law.

President Cohen, of the State Fish Commission, was also called upon, and spoke of the question of spring fishing at dams, which he hoped to see stopped. Not all the destruction was caused by nets.

Mr. Thompson said that at Spring Lake he had seen 5,000 lbs. of fish taken at one haul of a seine, and nearly all were game fish, none of which, big or little, were returned to the water.

Mr. Cohen was cheerful and well posted. He spoke of the great numbers of young fish which could be taken from the overflow waters, where they were cut off after the spawning season. "There are millions of these game fish, if we could save them," he said. Mr. Organ asked: "Why don't you save these game fish, and not the carp? I think that your 13 in. carp is entirely too long."

"Shall we, then, move all the market fishers off the Illinois River?" said Mr. Cohen.

"Yes," said Mr. Organ, "or give them bass instead of carp."

Mr. Cohen said that if the Commission had money enough it would put eight different crews to work during the two fall months which were the right time for saving these young fish in the overflow. Mr. Cohen then put his motion prohibiting dam fishing in the spring, which was carried as above stated.

Legislative Committee Work.

Mr. Shaw moved the chair appoint a committee on legislative action for the purposes of drafting and presenting a bill. Mr. Hough asked consent to offer under that head the following motion:

"That the chair appoint a committee of three, chosen from divergent parts of the State, for the purposes of drafting a constitutional and legally approved bill in accordance with the sense of the Illinois State Sportsmen's Association, and with discretionary powers to further the interests of such bill as shown in this meeting. These three members to choose one representative to address the Interstate Wardens' Committee, and to ask conference with that committee on matters of proposed game laws for the Northwestern States.

"It is made an advisory part of this motion that the chairman of said Wardens' Committee is Senator J. Herbert Green, Milwaukee, Wis.; other members, Mr. S. F. Fullerton, executive agent, St. Paul, Minn.; Mr. A. L. Lakey, Kalamazoo, Mich.; Mr. E. H. Short, Van Wert, O.; Mr. C. E. Felton, Chicago, Ill.; Mr. George E. Bowers, State warden, Fargo, N. D."

Mr. Shaw said he had no objection to the above motion as a substitute, provided that the committee held to the wishes of the present convention as expressed in their resolutions. He would oppose anything tending to prohibit spring shooting. The motion was carried, but still being suspicious of anything coming from the upper part of the State, Mr. Clark, of Peoria, introduced a resolution of instruction to the committee on legislation, by which said committee was advised to oppose any measure looking toward the prohibiting of spring shooting. Of course this was passed. It should now be clear to the framers of the Interstate wardens' bill, as well as to the general public, that the Illinois State Sportsmen's Association is plainly on record in favor of spring shooting, and will do all possible to withdraw this State from the league of united and wise action in regard to one important question. Should all the other Northwestern States stop spring shooting—as they all are sure to do before very long—and should Illinois stay out, still shooting in the spring, and still operating her cold-storage houses, we shall see the old instance of one State doing more harm than six others can do good, for the loophole will be bigger than the law. Have the gentlemen of lower Illinois ever stopped to consider this? Have they ever stopped to consider what would be the effect on the duck supply, provided that not a bird in the Northwest could be sent to market in the

spring? These gentlemen say that they get no shooting except in the spring. Are they sure that a general stopping of shooting would not bring them back the days of fall shooting, far more enjoyable than those of spring? Upon still another question it might be well for our Southern members to take thought. They seem to believe that the men of upper Illinois are not sincere, but selfish as themselves. They think that the Chicago shooters "skip over the line into Wisconsin and Indiana" in the spring. In this I think they are much mistaken. Some do so, but many of our best sportsmen do not. They are in favor of laws prohibiting spring shooting not only in Illinois, but also in Wisconsin and Indiana. They will join the sportsmen of lower Illinois in laying their guns in the spring, and thus prove that their position has not been one of selfishness, but of sportsmanship.

Non-Resident Licenses.

State Warden Loveday was called on. He said he believed in a good, stiff non-resident license, with a smaller one for residents. He thought outside shooters would not object. He himself would not object to such a license. Mr. Leopold, of Burlington, Ia., took up the question of non-residents who owned property in Illinois. Dr. Bartlett said he would like to see a good, fat tax on a good many non-residents. Mr. Shaw made a motion "That all non-resident shooters pay a license of \$5, excepting members of chartered gun clubs, who shall pay the same tax as a resident shooter." On motion of Mr. Scholes, Sec. 4 of the list of resolutions was changed to read in accordance with this motion.

Funds.

Mr. Leopold asked what should be done about funds for the committee work. Mr. Strell offered a motion which was finally carried in this form: "That the chair shall appoint a finance committee of five, with full power to act, same to solicit an individual donation of \$1 from each club member, the fund so raised to be used to further the objects of this meeting."

Mr. Organ said that there were 25,000 sportsmen in Illinois, and if each would give \$1 we could carry any bill we wanted to in the Legislature. (Laughter.) "I have been there, and I know what it means to fight for a game law. We have the hardest fight ahead of us we ever had. As to spring shooting, when a man runs for the Legislature in this part of the State he is first sounded on spring shooting. If he is opposed to it, he don't get elected."

Mr. Strell moved the appointment of a standing committee of promotion and publicity to send out circulars setting forth game protective ideas. His paper would disinterestedly print 25,000 circulars.

Votes of thanks were passed in the usual way, and the meeting adjourned on call of the chair. The chair will within five days announce the appointments for the several committees above specified. Any vacancy on a committee will be filled by vote of remaining members. It is likely that the committee on legislation will have for two members Mr. Shaw, of Canton, and Mr. F. S. Baird, of Chicago, the member for lower Illinois being not yet determined.

Feb. 12.—Chairman Abner Price announces the following as his appointees on the committees established by action of the Illinois State Sportsmen's Convention at Peoria:

On Legislation—Chairman, W. H. Shaw, of Canton; F. S. Baird, of Chicago; Daniel Raum, of Peoria.

On Finance—R. B. Organ, chairman, Chicago; E. Hough, C. S. Wilcox, Chicago; Chauncey M. Powers, Decatur; G. N. Portman, Peoria.

Publicity and Promotion—George W. Strell, chairman, Chicago; J. M. James, Pekin; Thomas Marshall, Keithsburg; J. H. Barber, Pittsfield; James Norris, Anna.

E. HOUGH.
1206 BOYCE BUILDING, Chicago, Ill.

Iowa Items.

NEVADA, Ia.—In our little city this winter there were displayed in the show windows of McCutchin's book store and Briggs' drug store the heads of two great bull elk. During the latter part of last October there appeared in these columns the notice of four of our best citizens leaving for Montana on a big game hunt. The heads were trophies of the hunt. The party consisted of Hon. J. F. Reed, Dr. C. E. Hoag, John M. Wells and Dr. F. S. Smith. The game secured was as follows: John M. Wells, two bull elk, two deer; Dr. C. E. Hoag, three deer, one goat; Dr. F. S. Smith, one bull elk; Hon. J. F. Reed, one bull elk, one bear, one goat—a total of four elk, five deer, one bear and two goats. The members of the party appointed Hon. J. F. Reed as scribe to write up the story of their hunt in detail. Mr. Reed promised some time ago to send in his manuscript to FOREST AND STREAM. If this should catch his eye (he is at present somewhere down East), I hope he will send on his "copy" soon, as there are many of his friends who would like very much to read the history of this successful hunt.

The measurements of the two heads which were on exhibition in this city were as follows:

Wells' elk antlers, from burr to tip of left antler, measured 45 in.; diameter just above burr, $10\frac{1}{2}$ in.; diameter above bez time, 8 in.; spread from tip to tip, 33 in. These horns, while not of great length or spread, were very heavy in the beam.

Smith's elk antlers, from burr to tip of left antler, 47 in.; diameter above burr, $10\frac{1}{4}$ in.; above bez time, $6\frac{3}{4}$ in.; spread from tip to tip, 39 in.

Is it not about time S. H. Greene, of Portland, Ore., was writing up his experiences of the past season with rod and gun? JOHN C. BRIGGS.

The Right to Bear Arms.

ST. LOUIS, Mo., Feb. 11.—Editor *Forest and Stream*: Your Man in the Clock Tower preaches evil doctrine, to Young America. He interprets the word "militia" in the Second Amendment to the Constitution as though it were synonymous with "national guard." There was no national guard when that amendment passed. The word "militia" meant then, and means now, the entire body of able-bodied citizens of the age of eighteen and

under forty-five (with certain exemptions, not restrictions), whether organized for military purposes or unorganized. Every such citizen of the United States has an inalienable right to carry openly any weapon suitable for military purposes. He may not carry dirks, slungshots or other weapons intended only for private vengeance. The several States control all military bodies other than troops of the United States, and can deny the privilege of drilling and parade to any armed bodies of men; but they cannot prevent the individual citizen from carrying military weapons at his pleasure.

"The right to bear arms is a natural right, not created or granted by the Constitution. The Second Amendment means no more than that it shall not be denied or infringed by Congress or the other departments of the National Government. * * * A law which should prohibit the wearing of military weapons openly upon the person would be unconstitutional."—Black, American Constitutional Law, 1895, pp. 403-404; supported by citations of rulings.

I know nothing about the disposition of the Man in the Clock Tower; but I do know that any attempt to deprive a Missourian of his arms while he was peaceably engaged in minding his own business would result in a first-class funeral. The Man says: "Once start the matter of restriction going in a legislative way, and no one could forecast where would be the end."

The end would be civil war. HORACE KEPHART.

Notes from New Brunswick.

To a man up a tree on a nice, clear winter's day the indications at present are that this Province will make a creditable display of its game resources at the Sportsmen's Exposition in Boston next month. Hon. Albert T. Dunn, Surveyor General, and Mr. L. B. Knight, Chief Game Commissioner, are giving their best attention to the subject, a liberal Provincial grant has been secured, and no effort will be spared to make the undertaking a success. Moreover, likewise, Dr. Heber Bishop, friend of the human race, has been down here on one of his swooping flights and stirred up the animals, to wit, a happy family of moose, two bears and a "lucifer," all of which have been headed for the Boston show. These are no post-mortem effigies or nightmares of the taxidermists, but real live specimens fresh from the menagerie of nature. Moreover, also, one Henry Braithwaite is at this moment delivering certain lectures to an audience of caribou on his farm at the Crooked Dead-water, and trying to persuade them to send a delegation to the exhibition. The big moose which Henry, with the assistance of Billy Chestnut, captured so cleverly in December last, was brought out in excellent shape and is now being embalmed by Mr. Carhall, of St. John, to form a part of the display. This moose stands nearly 7 ft. high at the shoulder and has an antler spread of 51 in., with twenty-four long points. It is to be hoped that the directors of the show will impress upon elderly gentlemen wearing long whiskers the necessity of keeping a respectable distance from the caribou at meal times. Propinquity is a prolific source of mastication so far as the caribou is concerned. FRANK H. RISTEEN.

FREDERICTON, Feb. 9, 1898.

Carolina Ducks.

Editor *Forest and Stream*:

January duck shooting was not so good as usual at Currituck, owing, we think, to the very mild weather. We noticed large flocks of redheads heading north yesterday, and we think they were saying good-by to us for this season. We saw this week a perfect redhead in color, but a perfect canvasback in shape. I suppose it was a cross between the two species, but never saw anything like it before.

Quail are still abundant in eastern North Carolina. While rabbit hunting on the farm of the Hon. Pierce Hampton last week, with foxhounds, in addition to 21 rabbits and 2 opossums we bagged 16 quail. A rabbit hunt with Bob Flora's hounds is fun indeed; He lives at Shawboro, N. C., on the Norfolk Southern R. R. This is also a good quail country. CURRITUCK.

THE MAN IN THE CLOCK TOWER.

Do you, wise reader, ever look down on people? Not in the sense figurative, which has its source in a fatter pocketbook, or a better suit of clothes, or riding in a cab instead of a street car, or any one of a million other things, but literally, as one whose line of sight is always along perpendiculars. The whole aspect of things changes. There is a general flattening of all objects on the earth's surface. Men walking directly underneath seem to be composed largely of a black disk which is carried about by a pair of intensely foreshortened legs which are supported by robust feet. Horses have much the appearance of Persian jugs lying on the ground side-

wise, and all vehicles for purposes of transportation appear to run very close to the ground on small wheels. Along Broadway, as far as the eye can see, there is a steady current of hats bobbing and squirming along, and quite as steady a counter-current bobs resolutely in the opposite direction. At the intersection of every cross street where the currents of hats cross each other, as also do the street cars, drays and other vehicles which fill the streets from morning till night in numbers which almost overflow the street limits, the solemn march of

the hats is disturbed. There are swirls and eddies and rapids of hats, all of which indicate that the wearers are dodging or hurrying to escape the juggernaut of commerce. It would seem to be a logical proposition that if one watched the hats long enough they would all pass by, either because the hat market of the world would be exhausted or because all the men in the world would pass by; but one can sit in the tower and watch the stream of hats come and go from the moment that the workaday world begins till it ends. Even from the tower the people on the earth's surface seem so small as to be almost insignificant, and it would seem to be no great feat to throw a brick at any hat within range, for all hats look much alike to a man in a tower. And yet to all men who are on the surface all men in a tower look much alike, too. But there is this difference, however—the man in the tower can see over a far greater field than the man on the ground, and of those things in it he writes for the man on the ground to consider, criticise, accept or reject, accordingly as he may find them sound or unsound, material or immaterial.

Let us Pause.

Let us pause and think of the safety of the elk in this wintry time, the safety which comes from the tender watchfulness of those who love the elk and minister to their wants. How the poor elk must have suffered in ages past for want of a loving and bountiful hand to feed them free hay! Up in the far north, where the caribou range in countless herds, they survive the inclemencies of the arctic winter, notwithstanding that they have no philanthropists to feed them hay first and sell them in the markets of the world afterward, and all in the name of humanity, but all in the fact of commerce. The dynamiter who saves the fish, the netter who saves the quail, the snarer who saves the partridges, the ranche which saves the elk, all commercial and alike in spirit, are such as should win the unceasing consideration of the people.

The Right to Bear Arms.

The Country Doctor, in his argument in favor of the right of the people "to have and to carry arms"—as he somewhat inaccurately expresses it—bases his arguments almost entirely on a matter of sentiment. The common possession and freedom in respect to the ownership and use of firearms in this country results from the necessities of the first settlers in defending themselves from hostile whites and Indians and savage beasts, in the first place, and from the traditions associated with the struggles of a few settlements in the beginning, up through the different gradations resulting in the American nation of to-day. It is a kind of inherited privilege, but it has no legal standing.

The Country Doctor seems to overlook the fact that, if the constitutional right to carry arms was vested in the people at large "to allow the people at all times to be prepared to resist encroachments upon their liberties from within more than from without," the same freedom which gave them a means of resistance would give the within enemy the same free means of attack.

That the founders of the Constitution had no thought of trouble so serious as to warrant a constitutional clause empowering every citizen to resist any law or force which he was pleased to interpret as an encroachment is amply proven by the fact that they based it all on principles for a republic. But whatever the form of government, there is always danger from foreign enemies.

Therefore Article II.—"A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed." This right is qualified expressly by a military necessity. Also, "bear arms" is a military term, differing entirely from the common colloquial term, "carry arms." If the Constitution intended that the people should have the right to carry a gun and tote a pistol or a razor for pleasure or for hunting purposes, it undoubtedly would have said so; but as it is one of the first principles in these matters that what is not given is withheld, each individual is necessarily restricted in his freedom concerning the tacking on of such personal legal idiosyncrasies as he might hastily or maturely consider beneficial to himself or to the Constitution.

In fact, the personal and special interpretation of the Constitution as exercised by individuals and classes has not been without a reference to arms. The moonshiner points grimly to the declaration "that all men are created free and equal," and that he has a perfect right to utilize his own products as best suits his own will and interests. It is impossible to convince him that he is free and equal under restrictions which prevent him doing as he pleases with his own property, as did his forefathers who fought and bled for freedom. He fails to note that the real freedom is that only of the citizen, a member of the body politic, and not the unrestrained freedom of the individual. It is the national freedom which all can enjoy alike without harm to the others, the freedom which insures the greatest good to the greatest number.

Some time in the near future I will touch upon the restrictive legislation which has already been recognized as a necessity in some different States concerning the carrying of arms, and I am quite sure that they will surmount even to a greater degree The Country Doctor, both by their scope and severity of penalty for violations.

THE MAN IN THE CLOCK TOWER.

THE following story is told of two Presbyterian ministers, one of whom, a Lowlander, was spending his midsummer holidays at the manse of his brother cleric, in a picturesque spot in the West Highlands. Both were enthusiastic anglers, and on the day following the visitor's arrival—Sunday—the pair enjoyed a delightful afternoon stroll after service. It was a glorious summer day; the scenery was most beautiful, the numerous streams lively with trout, and the woods full of songsters. "Man alive!" exclaimed the visitor enthusiastically, as he turned to his friend, "d'ye no' often feel tempted to tak' an' steal aff for a while's fishin' on sic a bonny Sunday as this?" "Na, na," was the other's reply, "I never feel tempted, I just gang."—*Fishing Gazette (England).*

Sea and River Fishing.

District of Columbia Association.

WASHINGTON, Feb. 10.—*Editor Forest and Stream:* The Game and Fish Protective Association of the District of Columbia held its annual meeting at the W. L. I. Armory, with a large attendance and the manifestation of much interest. Vice-President James L. Hood presided. Secretary-Treasurer Dr. W. P. Young presented his reports on the proceedings and administration of the finances for the last year. We quote as showing the activity of the Association:

On Feb. 8 a committee was appointed to prepare a bill for presentation to the Congress then in session. At the meeting on Feb. 15 Dr. Massamore, of the Maryland Society, represented that the bill before the West Virginia Legislature would be killed unless pressed. He was induced to give personal attention to this matter, and on March 26 made a formal report of his work with the Legislature of West Virginia. Armed with letters to the Governor of that State from Senators Gorman, Elkins and Faulkner, he met a cordial reception and promises of support. He found the bill slumbering; he had it brought up; read twice; properly engrossed; passed by both Houses and signed by the Governor. But for his timely appearance and earnest efforts the matter would have gone over to the next biennial session. The thanks of the committee were tendered the Doctor by Vice-President Hood in appropriate terms.

At the meeting March 31 Mr. Richard Sylvester was made warden of the Association.

On April 20 the secretary received from Mr. Geo. L. Nicholson, General Manager of the C. & O. Canal, and a member of our executive committee, a list of the names of sixty-nine of his employees between this city and Cumberland whom he commended as deputy wardens. This list was sent to Dr. Massamore, at whose request they were commissioned.

On May 19 Senator McMillan sent to the district commissioner for copies of the bills that we wished passed.

On Oct. 29 the committee was advised that Mr. Jos. H. Hunter had turned over to the treasurer the sum of \$91 received from the Evening Star for the purpose of seining the canal. The secretary-treasurer was instructed to ask the Fish Commissioner if it was his purpose to assist in seining the canal again during the ensuing season.

At the meeting Nov. 9 a letter was read from Dr. Massamore in answer to an inquiry concerning outlines, the purport of which was that "there is no law against them, except that it is unlawful to catch bass, pickerel, etc., except with rod and line." Capt. Brice, the Fish Commissioner, replying to the inquiry as to seining the canal, said that he considered the work of the greatest importance, and that if the Association would do what it can he would complete the work thoroughly.

On Jan. 11 a committee of seven—Messrs. John H. Gear, R. J. Bright, W. G. Sterett, John P. Miller, DeWitt Arnold, Chas. H. Laird and Richard Sylvester, the last named as chairman—was appointed to secure Congressional action on pending bills.

On Jan. 26 Mr. Rudolph Kaufmann and another member secured the unanimous and cordial approval of the district commissioners for an application to Congress for \$1,000, to be expended under the direction of the Commissioners of the District of Columbia in the enforcement of the game and fish laws, Gov. G. W. Atkinson, of West Virginia, who was in this city a few weeks ago, expressed earnest interest in the matter of water pollution, and promised active aid in securing the legislation necessary to effect the absolute purity that must be secured.

The work already accomplished by this Association has aroused interest in the adjoining States, and awakened the zeal of sportsmen in distant places. The annual fee is small, and as more work is to be done every member should feel the obligation of securing at least one additional member and of working with such earnestness for its success during the ensuing year that at its close this Association may be without peer among the game and fish societies throughout this country.

W. P. Young, Sec'y ex-officio of Ex. Com.

The warden, Mr. Richard Sylvester, read a detailed report on the effective efforts made to secure new legislation and enforce the old. Henry Talbott made a report from the committee on river pollution, as follows:

MR. TALBOTT, COMMITTEE ON RIVER POLLUTION, REPORTS.

Mr. Chairman and Gentlemen of the Association: At the close of the last meeting a few weeks ago, I was detailed as chairman of a committee on river pollution, with authority to fill a committee of five.

The appointment was something informal, but I accepted with alacrity, because next to feeding our bass this subject I believe to be the most serious with which we have to contend.

I did not appoint a committee because the subject was one on which there seemed little available information, at least I had little, and it seemed too a matter of some doubt as to what was required, whether a committee to besiege Congress, or the Legislatures of Virginia, West Virginia and Maryland, or simply a committee of investigation.

There has not been a day passed since this honor was tendered that I have not given the subject some thought and some effort, and it appears to me that for the present a "smelling committee" can be of most service.

The Congressional field is already occupied with a more imposing demonstration than we are prepared to make. Its line of attack is much stronger than ours could be, based on the more effective arguments of sanitation and the threatened health of our Solons and the city. This of course deserves our immediate and hearty encouragement. If they succeed our work in this direction is done. If they fail, we can hardly hope unaided to accomplish much.

Manufactures and their vested rights are so old, and fish protection is so comparatively new, as with us, for example, that it will be no easy matter to secure any restrictive legislation that interferes with the bread and butter of the citizens of the States named, simply to enhance the sport of gentlemen of leisure here; for that is the light in which the arguments against us will be presented, and these citizens will decline to be "butchered to make a Roman holiday."

I do not mean to despair of our being able to accomplish much good, but only that for the sake of our fish we will not at once be able to secure legislation with urgency clauses to wipe out the pulp mills and tanneries and coal mines.

Even the United Kingdom with her centralized system, her great body of hereditary sportsmen, her long efforts at protection, has been unable to perform the impossible, and her angling literature and health reports show pollution in plenty of her waters, and the same is true on the continent.

Andrew Lang calls names and consigns to eternal perdition the authors of our troubles like this:

De'il tak' the idle trading loon,
Wad gar the water ca' his wheel,
And sends his dyes and poisons down,
By fair Tweed side at Ashiesteel.

And Coleridge's familiar lines will recur to you:

The River Rhine, as is well known,
Doth wash your city of Cologne,
But tell me, nymphs, what power divine
Shall henceforth wash the River Rhine?

A book might be easily compiled from angling and fisheries volumes alone, of allusions to this subject, and this brings me to my conception of the field of this committee.

First.—A preparation of the history of the havoc wrought and fisheries destroyed here and abroad by the discharge of deleterious substances into the waters.

Second.—A scientific research into the effects upon the food fish and fish food by the various refuse of mines and mills and tanneries, and how far they may contaminate the waters, with especial reference to the Potomac.

Third.—A sketch of such legislation as may have been attempted or realized in the direction of restriction abroad or in the States, with suggestions of what in reason we may be justified in attempting to secure.

This is not so formidable an undertaking as it sounds, and would not prove so onerous in the assembling, nor so burdensome to you in the reporting as you may fear. I have already applied to every fish commission in the country for what their legislatures may have done in this direction, and have received kind responses and documents from many. There has as yet been no time to digest these; they are still coming, and besides I had too much consideration for you to impose on you a burden for which you

have provided an executive committee. But with the information we can in this and other ways secure we may be armed to make effective warfare if it is considered possible or desirable. Without it we will be firing blank cartridges or fishing without bait.

Such a course too seemed due to the dignity of this organization, which I have a sincere hope to see lead the world in its field. Located at the National Capital, with the queen of bass streams at its doors, in easy touch with the world's literature, and its sporting fraternity, and the men as well from the whole country who represent its sentiment and shape its policy, we have advantages which no other of its kind can boast of, and it will be our own reproach if we ignore or neglect them.

I am sorry if I have been tedious, but it seemed only duty to you as well as justice to myself that there should be an understanding as to what you desired. With your approval I will be glad to do what I can in the direction suggested.

Goethe said long ago: "Give me a positive man, away with the man who has doubts, I have doubts enough of my own." If you feel that mine is too pessimistic a view or involves too much delay, I will be glad to help some one else carry out your wishes. All of which is respectfully submitted.

The following officers were elected for the ensuing year: President, Capt. Robley D. Evans, U. S. N.; Vice-President, James F. Hood; Secretary-Treasurer, Dr. William P. Young; Warden, Richard Sylvester; Executive Committee, Dr. Walter S. Harban, Rudolph Kaufmann, George L. Nicholson, Harrison Dingman, Charles H. Laird, F. B. Curtis, Gabriel Edmonston, F. B. Maguire, James M. Green, Cluskey Cromwell, J. De Witt Arnold, Henry Talbott, Isaac W. Sharpe, Joseph H. Hunter, Jesse Middleton.

Dr. George W. Massamore, Secretary of the Maryland Game and Fish Protective Association, also a member of this one, made an address on the work of the sister organization in the field and legislation.

Dr. T. S. Palmer, Ornithologist of the Agricultural Department, addressed the meeting on the subject of protection of game birds from an ornithologist's standpoint.

Henry Talbott read a paper entitled "How the Potomac was Stocked with Bass." It will be printed in the next issue of FOREST AND STREAM as a chapter in the very entertaining series of Potomac angling chapters Mr. Talbott is contributing to this journal. COLUMBIA.

Green Turtle on the Florida Coast.

BY R. M. MUNROE.

[Read before the American Fisheries Congress at Tampa, Fla.]

EARLY travelers on the tropical coasts of America made much mention of the abundance of turtles to be seen in the waters at all times, and on the beaches in the spring season, engaged in laying their eggs. Just how many of these belong to the species *Chelonia virides* is mere conjecture, for aside from the tables of the rich and the cabins of the mariner, to the latter of which it often came as a godsend in times of hunger and scurvy, it was comparatively unknown; and as other species were edible and somewhat similar in appearance, the old chroniclers put them all under the one head of turtle. As a matter of fact, the loggerhead (*Thalassochelys caretta*), common now on our coast, when not oversized, and properly dressed and cooked, is not to be despised by a man even not hungry, and so also is the hawksbill, from which comes the tortoise shell of commerce.

With the advent of steam vessels, penetrating as they do the labyrinths of the West Indian Islands and adjacent coasts, enabling the perishable tropical products to be transported in safety, the green turtle has become a more common food and less of a luxury in our seaboard cities; and as most people take kindly to it, the demand has increased with the usual result in connection with natural products—a growing scarcity and higher prices.

Being, as it is, a nutritious delicacy, it is quite time that its habits, reproduction and methods of capture should be looked into before its enforced classification with the extinct reptiles; even if this should prove to be an event far distant, it might well be worth our time and attention to cheapen, by cultivation and protection, the present rather prohibitive price of a valuable food.

As is the case with very much of marine life, the green turtle is but little known as to its habits. At most, we can principally state that its food is a marine grass growing on the bottoms of lagoons and bays more or less shallow; that it mates on this coast in the month of May or thereabouts, the females with eggs, except in rare cases, at once disappearing from these waters and going no one knows where, until recently; but it is now reasonable to assert that their hatching grounds are in the beaches of various isolated islands off the Spanish Main and on the Bahama banks. How this migration is accomplished across the Gulf Stream current for hundreds of miles is past comprehension. As high as four batches of eggs, containing from 130 to 180 each, are believed to be laid by an individual during the months of June, July and August, and not repeated until an interval of one or two years has elapsed.

Incubation takes from ten to twelve weeks. After hatching, the young that escape the gulls and other birds on the beach, the fish and sharks, on entering the water again like their elders leave us with much thought as to where they pass the time until we occasionally see them in what is called the chicken stage of growth, so called from their resemblance to the flesh of the feathered barnyard favorite.

The foregoing few items are about all that is known as to habits, but sufficient seems to be established to form a reasonable hypothesis that much might be done toward protecting the young, and possibly caring for them until of marketable size.

At present the probabilities are that but an exceedingly small number survive the first week of existence, as low, maybe, as 2 to 3 per cent. To prevent this loss may or may not be an extremely simple problem, depending on whether turtles will mate and deposit eggs in suitably inclosed feeding grounds, or if the female alone in a condition to lay (these average about 23 per cent. of the catch in May and June on one reef at present) will carry out her maternal functions in captivity. If these two points are negative, then is it feasible to import eggs from the foreign depositories, considering the expense and possible complications as to ownership? And lastly, whether our supposed food areas would prove sufficient and suitable. The latter point, I think, can be favorably answered, as our lagoons have long been known as feeding places for the smaller sizes of turtles, and it is fair to suppose that the younger ones could find, in the same location, a diet congenial to them; therefore, if no serious obstacles were found in their production, the subsequent existence up to the age of

taking care of themselves seems assured, and at a trifling cost after once hatched.

The statistics in regard to this branch of our fisheries are meager and of little value. The few at hand seem to show that the average catch of mature turtles along the reef by nets in the past twenty years appears to be but slightly diminished. When the fleet is augmented by boats and men, the catch per boat decreases, and vice versa; but it is very evident, from personal observation covering the same period, that our feeding grounds or inshore resorts for the smaller and more valuable sizes have become almost depleted, a result occasioned, apparently, not by excessive fishing, but more likely by the gradual capture of the females on the outer grounds, who occasionally depart from the instinct of going to foreign parts for incubation, and lay their eggs on home shores, as it is hardly possible that the young from the distant hatcheries across the Gulf Stream should find their way back until fully matured and able to cope with their natural enemies in transit. For verification of some mooted questions, and additional information on others, I am indebted to Mr. B. Vincent Archer, a life-long fisher and close observer of the green turtle in these waters.

The Diamond-Back Terrapin.

THE naturalists usually call our friend offering text for this paper *Emys malacolemnys palustris*, meaning that he is a soft-shelled terrapin which affects living in marshes. The gourmet has translated the other name for him, *Emys concentrica*, into that toothsome phrase diamond-back terrapin, suggested by the markings on the upper shell.

How to cook him in the best way—best Maryland way, or in that other notable way, Philadelphia way—I shall later divulge. Just now I will point out three American species of the *Emys malacolemnys*, or soft-shell terrapin; then show how to catch him; and then how to cook him. Anybody can then eat a dainty dish who will.

Firstly, then, the three species of *Emys malacolemnys* inhabiting the United States and South America, and perhaps Italy, where Lucien Bonaparte, Prince of Canino, may have succeeded in propagating them some thirty years ago, are the *Malacolemnys palustris*, the *Malacolemnys geographica*, and the *Malacolemnys lesueri*. Of these the second and third are of slight edible value and are little used. But the first kind, the diamond-back, he is good to eat.

His alveolar surface is broad and nearly flat, slightly concave, occupies most of the length of the upper jaw, wherein it differs from the jaws of the other American terrapin, and so largely explains the superiority of its flesh; which is to say it can and does live upon superior food. Our friend likes nice fresh fish, and crabs, and celery, and such like dainties as he can find by quick swimming or walking round about his dearly loved salt marshes. The others are not very particular, and even our friend's first cousins, the *Emys malacolemnys geographica* and the *Emys malacolemnys lesueri*, are rather too careless and reptilian in their banqueting to commend their choice or to acquire a high gamy flavor.

Something of the clean salt of the salt water our friend loves, and of those salt marshes whence he seldom travels far, and in whose shallow, slightly water-covered mud he always hibernates a few inches from the surface, from middle autumn till middle spring, enter into him.

Round about such localities from Nantucket and New Bedford, Mass., to far away Texas is he found by terrapin hunters, but chiefly and in greater perfection in the beautiful Chesapeake Bay and in the Carolina sounds.

Diamond-back terrapins were once very numerous, but alas! pot-hunters have slain their thousands and tens of thousands. Unless the law shall soon enter and save the places that knew them shall soon know them no more. Bare will be the bars and flats or old logs on which in great numbers on bright days they used to sun themselves, and empty of them will be the waters whose surface their heads closely dotted, while they breathed quietly, easily afloat, for our terrapin's specific gravity is almost precisely that of water, and one more complaint will be added to the grievances of many "old boys" who have been known to sit sunning themselves in club windows, the while remarking, "That monstrous little rain water Madeira remains."

Now the diamond-back varies much in external appearance. The females are largest, much more delicate in flavor, and their eggs are—shall we say—delicious. Such a terrapin is naturally much the costliest. A terrapin 6 in. long on the under shell is called a "count," a female less than 5 in. long similarly measured is a "heifer," and such another male is a little "bull." Sometimes terrapins grow to be 10 in. long. Ordinarily they weigh about ¾ lbs. to the inch length. It seems to be conceded that the terrapin first lays eggs when about six years old. Seeking in spring a sunny sandy spot, preferably very near the water, and scratching a shallow hole with her hindlegs, she deposits five to seven eggs, which she carefully covers over, patting the sand smooth and firm above them. The warm sun must do the rest. And before the heat of summer is over the little terrapin about an inch in length has been evolved, the round, yellowish white egg elongating with his length. With his horny snout he breaks loose the egg skin within which for, say, eight weeks he has found his food. He and his little "bull" brothers and "heifer" sisters now generally wait beneath their sheltering sand covering, which has grown more convex and loose with their waxing size, until a wave shall come and uncover them, when, like Jason's men, full armed, they spring to sight and toward the water—and the gourmet's plate. But with no haste do they fall into either. Sometimes it is several days before these youngsters swim into the water, and as their normal growth is an inch each year it should be four full years at least before any of them die for another's good. However, there are stories of very much quicker forced growth. One experimenter specifically informed me that taking a terrapin just hatched in early spring he placed it in a salt-water pen just outside his kitchen window, whence scraps of fish, crabs, or any meat or vegetables the cook discarded were flung to it. Within a year the terrapin had grown to a greater length than 7 in. This is coming it strong,

yet I state but the facts as told me. But I must be permitted to state my great regret that a letter seeking written confirmation of this sea tale has failed of answer from my informant, Captain Lewis, of Lewisetta, Va.

To catch the terrapin there are many ways and very many men, women and boys. For instance, there is the hunter and his dog. They patrol the marsh beach at low tide during the laying season and trail the terrapin to her nest. Then during the winter time sharp eyes discern beneath the shallow water the little mound above the hibernating animal, and lo! another benumbed terrapin, caught by oyster tongs or what you will, shall come to town. During the summer days the dip net may catch the terrapin, inquisitive, though timid, who, hearing knocking on a boat above him, rises to "inquire," while the same game is played on him by torchlight by night, and he is crowded in to join the procession toward an early grave. But all these methods are child's play compared with those fateful ones of dredging, or of netting in one of its two great methods. To save for the last the worst, consider now the two chief ways of netting. Driving down a stake, to which one end of a long net is tied, the other end of the net weighted on its lower side is drawn circularly and in narrowing circles by a boat through the water above a favorite terrapin liar, whose denizens have been called by knocking "to look out for themselves." They do. The net draws regularly inward to a finish, and the terrapin are gathered to the fathers "at the club."

The remaining fateful form of net is known as the "trap." It is about 4 ft. long and has four or five hoops, some 3 ft. in diameter and rather close together. Of course the hoops support a net having funnel-like nets leading into it at both ends. Bait is hung in the center. Once entered, the terrapin remains, often in company with fifteen or twenty others, to see how somebody likes him. If this trap has not been so hung upon a pole as to keep its top above water the terrapin will drown, for he must often poke his nostrils into the air for breath. A slit in the trap side is our terrapin's exit toward clubland. Now all this last is summer work.

The drag, the fateful drag, does awful execution in winter. Invented in 1845 by Mr. William Midgett, of Roanoke Island, to supply his personal use, it has become the chief supplier of the market. This fell instrument closely resembles the ordinary oyster dredge. The upper bar is of wood, and the lower bar, of iron, has teeth which are 3 in. long and 2 in. apart. The bars themselves, which are held parallel, are 3 or 4 ft. long, and at the ends are separated by two loops about 14 in. in diameter. The bag is 4 ft. long. A sailboat will in winter pull one of these drags on either of its sides and back of it over the hibernating grounds of the terrapin. The gathered mud runs through the meshes of the bag. The terrapins remain just as safe from the catcher's standpoint as the written word. Of course the pitch of the drag is regulated by the position of the lines fastened to the two rings, and equally of course the drags can only be used in cold weather when the terrapin are chilled, under penalty otherwise of having these smart swimmers escape.

Beneath such manifold pursuit, urged on by payment of eight, ninety, nay, even a hundred dollars per dozen for "counts," as contrasted with one-third those sums even so recently as fifteen years ago, is it any wonder that the diamond-back terrapin is fast disappearing? Various methods for saving him from extinction and for ourselves have been tried. A notable one is the terrapin farm. This is nothing less than a terrapin-tight inclosure, allowing the salt water ingress to such marshland and sandbar as best represents his feeding and nesting grounds. But terrapins will not thrive under such conditions; so say private experimenters, and so the United States Fish Commissioners inform me. A proper supply of food may be lacking, despite what nature and an artificial ration of crushed crab and fish there present, or it may be that such a large proportion of the young terrapins have their heads or legs bitten off by the old ones—and such is beyond doubt the fate of many—that the experiment fails. Another certain cause of loss, say to the extent of 50 per cent., is death by gangrene, coming from bruises, incurred by many of the old terrapins bought for stock purposes from seiners or tongs who have kept them carelessly on the hard ground beneath some box or in a pen till their crawling about has bruised their feet. A terrapin once thus bruised dies inevitably from gangrene.

Protection by form of law is the other great effort to protect terrapin. As chairman of the special committee on terrapin of the Maryland Game and Fish Protective Association, I have been obliged to look into the efficiency of the Maryland State laws on this subject. In the main they are good, but they are irregular and they are not enforced.

Using them as a type they should provide:

1. A fine of \$10, half to the informer, for every terrapin found in possession from April 1 to Nov. 1.
2. Ten dollars fine for offering to sell at any time terrapins less than 5 in. long on the under shell.
3. None but residents of a specific county should be allowed to catch terrapins in its waters under penalty of violating the law of trespass and of paying any fine incident to breaking sections 1 and 2 above.

The enforcement of these simple laws would break up "pounding" (i. e., massing terrapins in a salt-water corral), which keeps the large terrapins from laying, prevents the growth of little bulls or of little heifers and their breeding by marketing them before maturity, prevents the growth of many little terrapins by exposing them to the murderous bites of the larger ones, and finally offers a reward for catching terrapins in illegal periods. As to this last, consider that if there be no receivers there will be much smaller incentive to poach upon the public.

Despite the enacted Maryland fines against having terrapins in possession, say, during the summer months, the pounding system exists in this State, and to such an extent that such an authority as the Standard Dictionary says "they (terrapins) are mostly caught in the summer and pent up in yards or corrals to be reserved for the winter months."

Terrapins bought from these pounds are always thin and so less toothsome; they have partially starved and so have suffered.

Now to redeem my promise as to style of terrapin cooking:

The approved Maryland style of cooking is as follows: Throw the live terrapin into tepid water, when the skin can be rubbed off with the finger remove the claw nails, and then briefly re-immersion in the same water until the shell cracks, finally remove them from the water, cut away the under shell and remove the gall bladder and the head, pull the terrapin to pieces with a fork, put in the eggs, and it is ready for cooking in a chafing dish. Upon the meat in the chafing dish in operation put a quantity of the best butter, and optionally a little milk or cream if it is desired to moderate the richness, add a proper quantity of black pepper and salt, allow to stew, stirring as necessary, and there you are!

Wine is better from a wine glass than from a dish, and flour helps make better paste than stew.

The Philadelphia style is as above, with the addition of eggs, cream, flour, spices and wine. From all which may Epicurus deliver us. This I say boldly, though aware that Baltimore, the boasted terrapin town, uses only one-half so many terrapins as despised Philadelphia. But right is not, nor ever was, nor ever will be surely a matter of numbers.

Before concluding I may be permitted to say a word as to the substitute for the diamond-back. On the Pacific coast and now here, imported thence, and from the midcontinent rivers and ponds to some extent, a fresh-water tortoise called *Chelaps marmoratus* is used, but it is a comparative failure, as lacking the right terrapin's gamy salt flavor. All conditions favor the introduction of our diamond-back along our middle Pacific coast, especially along the marshes about San Francisco. Why is it not accomplished?

But the greatest, and an awful substitute for the diamond-back is the slippery slider or *Pseudemys rugosa*. He is red-bellied and wrinkled, as his name implies, and may we soon see the last of him, but we won't. It seems to me cooking this slider with saffron would vastly improve him. Certainly horse flesh so cooked becomes much less greasy tasting. At any rate you cannot spoil slider by any process of cooking.

The terrapin, the oyster, and our fishes and birds are quickly being exterminated. To increase the supply of them, that the pleasures of seeing, pursuing, tasting and eating them may be more generously accomplished, is the object I seek to help by this paper on one branch of the subject.

As for my single self, who can find sufficient gustatory pleasure and strength in viands simple, as bread and milk, and to whom the rich gravy of "terrapin stew" is somewhat displeasing, I must acknowledge that with me, according inferior rating to this superlatively vaunted plate, the gourmets do not all agree, though their dishes do.

DE COURCY W. THOM.

BALTIMORE, Md.

The Massachusetts Association.

BOSTON, Feb. 9.—*Editor Forest and Stream:* The event of the year, the annual banquet of the Massachusetts Fish and Game Protective Association, came off at the Copley Square Hotel on Tuesday evening, and like its predecessors it was a most enjoyable affair. From a variety of causes there was an absence of some familiar faces. Col. Rockwell, the president, was unavoidably absent on account of the death of a relative; Dr. Heber Bishop is in the Maine woods seeking live game for the Sportsmen's Exposition to be held here next month, and Gov. Wolcott, who expected to be present, was obliged to send his regrets. This was a disappointment to all present, as the genial Governor takes a great interest in all matters for which the Association stands. At 6:30 the company, to the number of 130, proceeded to the tables, the guests being Col. H. A. Thomas, Rev. E. A. Horton, H. A. Stevenson, of Pittsfield, a member of the Legislature; Hon. L. T. Carleton, of Maine; Rev. J. C. Jaynes, of Newton, and Antonio Apache. There were also present William Almy, T. G. Brewer, Loring Crocker, Luther Little, William R. Sears, Stanley Smith, George O. Sears, H. W. Abbott, P. W. Scudder, W. H. Allen, Dr. G. G. Sears, Dr. Robert M. Read, Judge J. S. G. Cobb, of Providence; John A. Morse, of Co-tint; Fred H. Talcott, Dr. H. W. Blair, Henry F. Colburn, William K. Churchill, Lewis C. Marshall, Hon. Robert S. Gray, J. A. Victorson, Nelson L. Martin, Dr. A. R. Brown, Dr. J. N. Ball, George H. Moore, Warren Hapgood, B. N. Howe, Joshua S. Duncklee, A. S. Adams, Sumner A. Gould, Edward E. Small, H. F. Morse, Dr. E. W. Branigan, Dr. William D. Ferguson, George H. Bartlett, Charles H. Cole, George M. Parker, James L. Wesson, C. W. West, Charles Butcher, Horace Litchfield, Hon. George W. Wiggin, William H. Sweatt, Hon. John G. Ray, S. W. Rich, William B. Bacon, John N. Roberts, Judge S. A. Bolster, A. D. Thayer, Myron W. Whitney, Arthur W. Robinson, president Megantic Club; Dr. John T. Stetson, Frank C. Brownell, W. L. Mercer, William J. Newman, Benjamin F. Stevens, J. W. Wildman, H. S. Garfield, J. Franklin Wight, A. C. Risteen, Thomas Dickson, Charles W. Spear, C. J. Woodbury, Walter M. Brackett, E. A. Samuels, Joseph W. Smith, Henry Allen, Henry N. Sawyer, William F. Smart, Henry Briest, John E. Hull, I. W. Adams, William C. Prescott, Charles Stewart, Thomas H. Hall.

Ex-President B. C. Clark, in the absence of Col. Rockwell, occupied the chair, and in his usual hearty, breezy manner kept things going at a lively rate. In opening the speechmaking he called attention to the recent report of the State Fish Commission, especially in the falling off in the lobster fishery. This was a most important matter, and one demanding the utmost vigilance on the part of the Association. Reference was next made to the wanton destruction of plumage birds for millinery purposes. He quoted from a recent magazine article of Miss Hooper that sentiment was one of the grandest things in the world, and said that in no place was sentiment such a force as in such a body as this, one of whose chief aims was in preserving the bounty of nature. This was a worthy object and one that demanded and should receive our best thought and attention. Before proceeding to introduce the regular speakers Mr. Clark read a few letters, one from ex-President Cleveland regretting his inability to accept the committee's invitation to be present and expressing his commendation of the objects of the Association; another from Rev. W. H. H. Murray, whose hearty words plainly showed that he has not forgotten

the pleasures and good fellowship of the woods and streams. The Rev. J. C. Jaynes, of Newton, was next introduced, and the company soon found that here was a member of the cloth who knew the forests and the lakes, and how to get into close touch with his fellow-sportsmen; for wit and story and sentiment and sound practical sense it was a speech to be remembered, and when he said that from his own experience he had found that when a clergyman went into the woods he should take a layman along with him to do the talking (on particular and special occasions), not one of his hearers failed to catch his meaning. Representative Stevenson, of Pittsfield, a member of the committee on fish and game, responded for the State. He believed the members of the Legislature were more in accord with the objects of the Association than was generally supposed. To be sure, there had been difficulty in procuring proper legislation for the better protection of fish and game, but it was due in a considerable measure to the wide divergence of views of the sportsmen themselves. Col. Thomas, postmaster, and Rev. E. A. Horton, always welcome guests, made happy speeches, and Hon. L. T. Carleton, chairman of the Maine Commission, made a strong and earnest appeal on behalf of fish and game protection. He said that despite the fact that 10,000 deer, 250 caribou, 250 moose, 150 bears and 150 tons of trout and landlocked salmon were taken in Maine last year there will be a greater abundance this year than ever, with the possible exception of moose. He said they were greatly hampered by the illegal shipment of fish and game to the Boston markets, and that it would greatly add to the game and fish preserves of Maine if it could be made illegal for citizens of Massachusetts to sell or expose for sale fish and game shipped from Maine. J. Russell Reed, Esq., counsel for the Association, enforced the position taken by Mr. Carleton, and said further that Massachusetts by putting a premium on the importation of game illegally shipped from other States ranked as the lowest of any State in the standard of game laws. Antonio Apache, a full-blooded Indian, educated at Harvard, briefly responded to a call. The chinks of the evening were filled in with songs by Myron W. Whitney, music by Daggett's orchestra, and more songs by a quartet led by W. C. Prescott. The whole affair was voted one of the most enjoyable ever held by the Association.

WILLIAM B. SMART.

Lake Erie Fish Protection.

ON the 15th of this month there will be an important conference of the Governor, the fish and game committees of the House and the Senate and the State Fish and Game Commission, to discuss the best measures for the protection of the great fishing industry of Lake Erie and its waters. Several Toledo citizens have been invited to be present at this conference, and the Commercial is again requested to give its opinion as to what had best be done. Gov. Bushnell has expressed a commendable determination to do what he can for this great interest, and he has given proof that he grasps the importance of the interests involved. After fourteen years of close and thoroughly practical observation of the workings of all the laws that have been tried for the protection of the fishing industries of Lake Erie, we may have somewhat profited from the knowledge obtained.

We have already said that the best thing to do was to protect the waters of Lake Erie wholly against nets for the next five years. This the people have the right to do, and this the courts will sustain them in doing, and this is the thing that can the most easily be done and the thing from which the net fishermen would the most greatly profit in the long run. Afford such protection, and from all the waters of the upper northern lakes, where net fishing is permitted, the swarms of fish would come to the protected waters of Ohio, so that in less time than three years, we believe, the fish would be more abundant here than they ever were before, for it is a well-established fact that the fish desert the waters where the nets are numerous for the others free from these murderous devices.

But if the Legislature cannot be convinced that this is the proper thing to do, then the next best policy is to place the waters of the State under the control of the Game and Fish Commission, with the power to make such regulations for their protection as are needed. Ohio has now the best game and fish commission it ever had. This body has shown an active and an intelligent interest in the protection of game and fish. In Lake Erie its powers have been so limited that it could do almost nothing, and here protection was the most needed. The present State fish and game warden has shown himself to be an able and an energetic official. Every fish that swims in the waters of Ohio belongs to the people of the State. That principle has been thoroughly established by the decisions of all the courts, the Supreme Court of the United States included. The Legislature, as the agent of the people, has the right to do with the waters of the State whatever may seem best for the interests of the people. It should establish that the Commission was to permit no nets where the passage of the fish to their spawning grounds would be obstructed; the chief object for some years being the propagation of fish rather than the creation of a revenue for the State. No net should be permitted to be placed in the water until a license of at least \$50 was paid to the Commission. In this way all the expenses of the Commission could be paid from the first, and in time a splendid revenue would be raised for the people. No net should be set until a place was designated for it by the agents of the Commission. A salary should be paid to the Commission, for much of its time would necessarily be devoted to this work. No additional burden would be placed upon the people, for the receipts of the Commission would supply all needed funds. If this plan is not satisfactory, the Commercial will suggest some other things that must be done, if this interest is saved for the people.—*Toledo Commercial*.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Salmon in the Hudson.

Editor Forest and Stream:

I have read with much interest Mr. A. N. Cheney's valuable paper on the Hudson River salmon plant, which was read at Tampa, Fla., and appeared the same week in your columns. But there is an omission which, I submit, ought to be supplied as showing some credit due to the FOREST AND STREAM and its former editor for putting the initial stocking movement on foot. If you will refer to your files of 1873 you will find the letter of Prof. Baird which is embodied in the excerpt from the Brooklyn Union, which I herewith inclose for publication, if it pleases you to give it space.

CHARLES HALLOCK.

Salmon in the Hudson.—Through the efforts of Mr. Charles Hallock, the editor of the FOREST AND STREAM, the Hudson River is soon to be stocked with salmon. The series of articles published by Mr. Hallock having called the attention of the United States Fishery Commission to the subject, that gentleman has received the following letter, to the effect, that his request will be attended to:

"United States Commission Fish and Fisheries, Washington, Nov. 11, 1873.—Charles Hallock, Esq.—Dear Sir: I am perfectly willing to place a good lot of Sacramento salmon in the Hudson River. Seth Green has 250,000, and I will request him to dispose of a portion for that purpose subject to your direction. Very truly yours,

"SPENCER F. BAIRD, Commissioner."

This will be gratifying news to our New York sportsmen of the angle, and they owe Mr. Hallock thanks for his efforts to restore the game fish to the waters of the Hudson, where they once abounded.—*Brooklyn Union*.

Wheeling.

The Wheel and the Rod.

MORRISTOWN, N. J.—Having read of fishing trips on a bicycle, I am prompted to tell of my experience for the past two years on the silent steed, with rod, reel and landing net firmly fastened in under the seat. When the night before a fishing day comes I begin to prepare for the to-morrow, get out my bike, clean and oil, strap on my fishing tackle, get things handy in the kitchen, so as to be able to prepare a breakfast without arousing the neighborhood, set the alarm clock at 3:30 and then turn in.

Tip—bang! goes the alarm, and by 4 o'clock I am on my way. I have fine macadam roads for the first three miles, and then a hill of a mile, very steep in some parts. I wore out two pairs of shoe soles trying to keep the wheel under control on this part of the journey last summer.

But what sport awaits you when the lake is reached! I cannot describe the feeling as you joint your rod and attach the reel, fix up line and leader, and fish around in the bait box for the largest shiner, or one that just suits your fancy, you wondering all the time what large bass is waiting to pounce upon it. You get started, and with 30 or 40 ft. of line trailing behind the boat, troll slowly up the lake. All at once down goes one of the corks, and the line begins to move off sideways; up comes the cork, jumping and bobbing around. Surely the bass is having a good time with that bait. Down he goes again, and the old reel begins to make music. Let him go a little further, then we gave him the hook. Now the fun has begun. Now we reel him in slowly, and have him within a few feet of the boat, when away he goes again with a rush. But finally we have him alongside the boat, and scoop the net in under, and he is flopping on the bottom—as fine a bass as any one cares to be seen with. And so it goes until we have seven or eight beauties.

Looking down toward the landing, I see old man K—just getting ready to start up the lake. He is a regular visitor to the lake, and always complaining and finding fault with the man that has the bait. You give him all the big shiners or sort out all the red fins for him. He very seldom catches any bass, but can catch any number of small pickerel. I seldom catch any pickerel, but almost always catch a nice lot of bass. He cannot see how it is. If he would stop to think he would see very soon how it is that he catches pickerel while I catch bass. The bottom and sides of the lake are covered with a growth of weeds. I do not know what kind they are, but in some times of the year they are within 3 ft. of the surface of the water. He never uses a cork, and his bait goes scratching along, and when he reels in you cannot see his bait for the weeds that are fastened on the hook. For catching pickerel your bait should be down in the weeds, but for bass you want the bait up near the surface; at least I find it so in this lake. I use a cork attached about 4 ft. from the bait, and have a very small sinker about 1 ft. from the hook. I only missed three trips last summer that I did not catch a mess of bass, and went almost every week. Very often I would have enough for two or three of my friends' wants.

It is surprising what an amount of luggage one can carry on a bicycle. I have had strapped on my wheel two fishing rods, a box with two reels, lines and a lot of artificial bait, nine bass that weighed 16½ lbs., a light overcoat, landing net and a big bunch of water lilies. Talk about your floral parades—they were not in it with that wheel. It could be tracked from the lake right to our back gate—a regular trail of lilies.

A FISHER WITH A CORK.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

A Raccoon Hunt in Maryland.

Editor Forest and Stream:

Along in the middle of November, when the leaves have all fallen from the trees, and the landscape is all bedecked by a feathery bed of the same, the bare trees making the forest look bare and desolate, the sport of raccoon hunting is in its height in Maryland.

The sport of coon hunting, as it is commonly known in Maryland, dates back to colonial times, and the custom, or the art (for certainly it has been brought to an art by those who indulge in it), has been handed down from generation to generation with a persistency that, if it were not for the fact that many parts of the State offer such good refuge to the animal, it would long ago have become exterminated.

The raccoon hunt is nearly always carried on with a campaign of frolic and hard cider, and here, as in politics, all men meet on common ground.

In the first place, it is necessary to have dogs which are trained in this particular line. Without them the attempt to discover a raccoon would turn out to be a fruitless piece of business.

The night is the time in which this sport is carried on, and many a mile is tramped over, through timber, brush, evergreen, and across creeks and rivers, in following the lead of the dogs, until the raccoon is finally treed.

A few years ago John Dickson, Fred Rainer, William Cross and myself, with two colored men by the names of John Jackson and Scott Johnson, indulged in one of those delightful frolics in the southeastern part of Howard county, along the Patuxent River. On a cloudless Saturday evening, having laid aside our cares and labor for the week, and the weather being superb and bracing, we arranged all the preliminaries, and when the shadow of night commenced to appear on the eastern horizon we, with four good trained dogs and a goodly supply of refreshments, which included a jug of cider, started for the forest near the cornfields along the river hills.

Of course we had prepared for a delightful time, and possibly for some raccoon. The colored men each carried an axe, the main instrument and weapon in a successful campaign against the raccoon.

We tramped several miles along the hills, crossing several small patches of cornfields, when at once we heard the familiar yep, yep, yep, and we knew that the dogs had struck a trail.

Now the real fun in a hunt of this kind actually commences. All discipline is lost or laid aside. Away we went, in a full trot, every man for himself the best he could, and in such a manner as is only known to raccoon hunters, John Jackson leading, Scott Johnson next, and then the rest of us bringing up the rear.

Whatever may be said regarding darkies' inactivity and sluggishness in the performance of labor, this reproach all very suddenly is forceless when that "yep" of the raccoon ferrier is heard by them, and they scent the flavor of fresh raccoon broth. It may be said with absolute truth that there is only one thing in the whole wide world which can awaken a darky's latent physical energy and ambition quicker than the possibility of getting a fresh raccoon stew, and that is a good, big, fat opossum; and no theme or subject is gone over by them at their rallies and gatherings with the same zest and spirit as the relating of the stories of the coon hunts.

Well, the dogs were getting hot on the trail of the raccoon; this we could tell by their yelps, and the two darkies were not far behind in the race, and every little while could be heard these ejaculations: "They am gwine to tree him, sho'!" And sure enough they did.

This was some three and a half miles from where we first started, and in a dense oak forest the raccoon had found a hollow oak, and when the dogs were pressing him he took refuge in this hollow tree.

Soon the yells of the two darkies informed us that they were there and had commenced operations to bring down the tree. That is what the two axes were for, and without them this raccoon would have been perfectly safe. When we arrived at the tree Jackson and Johnson had about half of it cut, and we relieved them while they took a pull at the jug.

I corralled the dogs and took them to a safe distance from the tree, while the darkies continued the labor of chopping it down. When it finally fell I turned the dogs loose, and of course, as is always the case if the raccoon is not mortally wounded by the falling of the tree, he comes out and tries to escape. This time he came out and undertook to get away, but one of the dogs nabbed him, and soon the other dogs were there to assist; and then the tussle began. In such cases a shotgun is of no value, for just as likely as not one of the dogs might be hit instead of the raccoon. Rainer, however, had had experience in the business, and he watched the fight until an opportune time presented itself, and with a club dealt the animal a blow on the head which laid it out. The finishing work was then accomplished with a hunting knife. After all these exciting scenes the ubiquitous jug was passed around, as each told his story how the fight appeared to him; how Spike grabbed him by the neck; how Count got him in the flank, and how Major threw him, and so on. The dogs were also petted for their brave work.

After partaking of more refreshments we again started the dogs off. Jackson took possession of the game, and we trudged along about three-fourths of a mile on the edge of a cornfield, when the dogs were again successful in striking a trail, and away they went, darkies and dogs, helter skelter, through woods, across plowed land, over rocks and boulders, in hot pursuit of the game. Jackson was encumbered somewhat with the game he

was packing along, but this did not seem to prevent him from keeping pretty near the dogs.

The dogs followed this trail for about a half an hour, and then lost it; they were not successful in recovering it again. The midnight hour was by this time approaching, but a real raccoon hunter never goes home "until daylight does appear;" and so, after another successful nip at the jug all around, we started the dogs out for the third time. Here Johnson took the burden of lugging the game, and we traveled along slowly for at least two hours, making a sort of circuitous route so as not to get too far from our starting point. Finally the dogs again found a trail, and for the third time they and the darkies scampered off together after a raccoon.

My companions and myself were not quite so sprightly and gay as we were when the dogs got on the trail of the first raccoon, but notwithstanding we managed to get up a respectable gait. On, on we went, and it seemed as though that raccoon might give the dogs a chase until morning, when it would be time for us to retire to our beds for a little sleep before old Phœbus would cast his searching eyes over the horizon. Now through a briar patch and then through a cornfield, and finally into the timber. Again we could tell that the dogs were closing in on the raccoon and that he would soon have to find a tree or else the dogs would get him. On they went for ten or fifteen minutes more, and then we could tell that the raccoon was treed.

A little later on we heard Johnson's voice calling to us: "Cum on, cum on! he's up a tree, sho!" Then came the same process that we went through before. The tree had to be felled, and then chance given to the dogs to get the animal after the tree is down; in this, however, the dogs hardly ever fail. After the tree had been cut down the raccoon did not appear, as is generally the case, but stayed in the hollow of the tree. He was soon compelled to give up his fort, though, on account of a stick Johnson had run up in the hollow of the tree, and with which he was dexterously battering him. When he did appear on the scene one of the dogs caught him by the shank and Jackson had the honor of killing him, which gave him the advantage over his partner in the point of telling the story in some of their future gatherings.

By this time our refreshments were beginning to give out, as well as ourselves physically, and we concluded that two raccoons in one night was not so bad after all. But not knowing what might happen, we kept the dogs out while we made our way toward home.

It was now 4 A. M., and we all agreed on our homeward march that our hunt was a complete success. Jackson had one of the raccoons and Johnson the other, and I the empty jug. When within a mile or so from home the dogs took after something and soon treed it. The two negroes took out after the dogs, shouting: "Possum! possum! sho' as use alive!" The small tree the supposed opossum had gone into was soon reached by the two darkies, and they undertook to shake it down, but it would not shake; so Johnson climbed up and caught the animal, and any one can imagine the disgust of the two darkies on being sold with a big, frisky old tomcat.

Well, we rolled on, and a happier and more cheerful lot of fellows than we never were found anywhere. The two darkies sang: "Dar is a coon ober dar, dar is a coon ober dar, and we jes' slip ober and git dat coon ober dar." In this song we all joined, and when home was reached we at once retired; and when old Phœbus cast his casual glances around the next morning he failed to discover us, for we were still enjoying ourselves in slumber—sweet sleep!

Now a word in regard to our game:

The raccoon belongs to the family *Procyonidae* and genus *Procyon*. The animal is so called from its habit of dipping its food in the water as if washing it before it eats. It is 2 ft. long, with a stout body, short limbs, pointed ears, broad face, sharp snout, a bushy, ringed tail, of a general grayish coloration, and feeds on fruits and vegetables as well as animal substances. Its flesh is eatable, and is greatly relished by the colored population of the South. The hide is used for fur caps and fur overcoats.

It was near the noon hour when we awoke from our slumbers and dreams of raccoon. We then proceeded to divide the spoils of the night's sport, Jackson and Johnson each getting a half a coon and the balance being divided among us four, and then each man departed for his own habitation; but before parting all agreed that we would try it again soon, as these raccoon hunts seem to be quite the proper thing. M. W. STROUSE.

American Spaniel Club.

At a meeting of the executive committee of the American Spaniel Club held on Feb. 5, 1898, Messrs. E. H. Oldham, R. P. Keasbey, S. J. Bradbury, H. K. Bloodgood and Marcel A. Viti being present, it was decided to hold the annual meeting on Feb. 22, 1898, at 4 P. M., at Madison Square Garden.

The club's annual dinner will be held upon the same date, at 8 P. M., at Zangheri's, No. 17 East Twenty-second street, New York. Tickets for the same may be procured from members of the committee.

The third annual sweepstakes will be judged at the New York show. In addition to the cash added to each stake by the club, the president offers silver medals to the winners.

During the fiscal year last past the leading bench shows conformed to the club's requirements by adopting one of its classifications and requesting a club judge to officiate: New York, Chicago, St. Louis, Baltimore and Toronto, 1897, adopted Classification No. 1 and adopted additional classes; Boston, 1898, adopted Classification No. 1, and Pittsburg and Brooklyn, 1897, adopted Classification No. 2.

Fifty-eight special prizes were offered by the club for spaniels. This number includes the following cash specials: New York, \$20; Chicago, \$20; St. Louis, \$20; Pittsburg, \$15; Baltimore, \$20; Toronto, \$20; Brooklyn, \$15; Boston, \$20.

During the year the total entries of spaniels at the shows amounted to over 800.

Pacific Coast Field Trials.

THE fifteenth annual meeting of the Pacific Coast Field Trials Club was held at Bakersfield. The trials began on Jan. 24 and ended on Jan. 27. Mr. Arthur Merriman, of Memphis, and Judge C. N. Post, of Sacramento, Cal., assumed the judicial duties. There were eight entries in the Derby. Judging from the report in Field Sports, the competition was feeble and low in grade. The winners were, first, J. E. Lucas's pointer dog Alex C. (Glenbeigh—Saddlebags); second, W. S. Tevis' pointer dog Cuba of Kenwood (Glenbeigh, Jr.—Stella); third, Frank Maskey's English setter bitch Lady Rod's Chaff (Rod's Chaff—Cresida). In this stake were four setters, one of which was Irish, and four pointers. Of the winner, the report says of his first work in the heat with Teal:

"Alex ran into a bevy and flushed it, the birds going into good cover. Working the brace on to the scattered birds, many flushes were made which seemed inexcusable, but scent might have been bad, as a north wind of some force was blowing. Alex made two points from which birds were raised, and five where no bird could be found. Alex showed considerable speed and at times fair range, making some good casts, but comes in to his handler too much, and has a very bad habit of stopping to point where there is no bird."

Lady Rod's Chaff's work was such as would have put her out of any stake in which there was competition worthy the name. In her first heat "Lady Rod's Chaff ran into a bevy down wind, which flushed and settled in sage on a slight raise. The dogs were sent after them, where Lady made two points, nicely backed by Verona, but in both cases, before her handler reached her, Lady broke in, flushed in and chased. This was all the work done in the heat. Both bitches were fast and wide rangers, very stylish in their manner of hunting and pretty movers. Both made some nice and intelligent casts, and should make very classy workers when properly broken. It was claimed that Verona was sick, which was probably so, for she showed no evidence of nose whatever."

In the second round in the heat between Lady Rod's Chaff and Alex C. "Lady was the first to find, but pursued the same tactics of the day before and flushed the bevy. A minute later she pointed an outlying single which had not gone with the bevy, and when it flushed she started to chase. Alex, working up on the bunch, made a number of points from which no bird could be raised, and four to which he was steady, to shot and wing. Both dogs backed well. Lady made altogether one bevy and three single points. Lady works with nice, high head, has good speed, covers her ground to good advantage, made no points from which birds were not raised, and has very good style both in motion and on point. Only her flushing and chasing, which followed every point, lost her race."

In the final heat between Alex C. and Cuba of Kenwood, "some good and a good deal of bad work was done. Each got one good point and both back nicely, but Alex with his characteristic caution made three false points. In range they are about equal, but Alex is a trifle fast and puts more spirit into his work, shows better style."

There were fifteen starters in the all-age stake. Dash Antonio and Valiente bolted the competition and out of the race.

The winners were, first, E. V. Sullivan's setter bitch Peach Mark (Mercury—Betsy Mark); second, W. S. Tevis' pointer dog Cuba of Kenwood (Glenbeigh, Jr.—Stella); third, Mrs. Caesar Young's setter dog Luke (Toledo Blade—Cambriana).

The Eastern importations were not largely in the winners' places, which is as one should have anticipated, considering the radical difference in the habits of Eastern and California birds, the difference in methods respectively, the differences of climate, etc.

At the club meeting held on Jan. 25 the election of officers took place as follows: President, H. W. Keller; Vice-President, J. E. de Ruyter; Second Vice-President, W. S. Tevis; Secretary-Treasurer, J. M. Kilgariff; Executive Committee, J. E. Terry, C. N. Post, J. H. Schumacher, Andrew Jackson and William Schrieber. The third Monday in January, 1899, was fixed for the date of the next trials.

Was it Rabies?

Editor Forest and Stream:

I had an English setter of good breeding, and as a hunting dog he would be hard to improve upon. He could locate a bird further than any dog I ever saw. On Dec. 30 we were crossing a field, when suddenly he turned to the left and made straight for an old overgrown ditch, by actual measurement 360 paces away, and there came to a point on some quail among the grapevines; and he would have held that point for any reasonable length of time. He was a fine retriever, and was just about what Col. Hough, of Chicago, would call a "meat dog." He was a very mild-mannered old fellow, and was never known to get into a fight. About the only thing that would wake him up was to see me getting ready to go shooting, and even then he would not get excited, as some dogs do.

Last Sunday my little girl and myself were snowballing each other, when, much to our surprise, Tom came bounding up to us and grabbed me by the arm, his teeth just touching my skin. We wondered at it, and went at the snowballing again, when he jumped right on Margaret and pulled her down in the snow, but let go the moment I said "charge!" I then sent him to the barn. Next morning he failed to show up for his breakfast, but they thought he had gone downtown with me to the office, and of course I supposed he was at home as usual, till a farmer came in and said my dog had appeared at his place, fully ten miles away, very tired and covered with blood; that he had brought him to town in his sleigh, but that he had jumped out of the cutter on the outskirts of the town and pitched into a dog. I at once went on a hunt for him and found him in the act of tearing a dog to pieces; but he came up as usual, wagging his tail, when he was called. We secured him, chained him up and nursed him all week, but on Thursday he was evidently in a great deal of pain and howled all night, although we did everything possible for him. On Friday he had a very severe at-

tack of diarrhoea, and on Saturday morning he died. I would say that on Thursday night when he appeared to be suffering so much he tore everything to pieces within reach. He had a canker in the ear, and I thought it was cured last fall, but when the cold weather came it reappeared. I have examined the ear, but do not find very much inflammation existed, and I can hardly think that the canker was the cause of the trouble.

I find that after he left the house on Monday he made a most furious attack on a shepherd bitch, almost killing her, which he undoubtedly would have done had not the owner appeared with a stick and driven him off. Then he chased a hound into a shed and tried to get at him, but could not, as the hound had taken refuge under some machinery, and my dog could not reach him. He then left and trotted quietly along the road till Mr. Fowler found him and brought him back to town, where he caught a mongrel cur and almost killed it before the owner chased him away with a club. Then he got hold of another cur, the one he was mauling when I found him, and killed it outright.

It will be a long time before I get another dog as good as old Tomboy, and my sympathy is with any one who loses such a good and faithful animal.

J. W. COWAN.

Diseased Dogs and Dog Show Rules.

NEW YORK, Feb. 7.—To intending exhibitors at the coming bench show to be given by the Westminster Kennel Club in Madison Square Garden, opening Feb. 21, I desire to say that almost every year a few dogs are presented for admission whose conditions are such as to make them objectionable on the bench, being perhaps afflicted with contagious diseases or with some form of skin disease, though not necessarily of a contagious character, still rendering them undesirable as exhibits, and which it is my unpleasant duty as veterinarian to exclude. I would suggest that the following rule be carefully read, viz., Rule 9, clause 3, American Kennel Club Rules Governing Dog Shows:

"A dog suffering from any hereditary, contagious or objectionable disease shall be disqualified and forfeit the prize which may be awarded it, and shall be at once removed from the building. A regularly appointed veterinary surgeon shall alone decide as to the condition of the dog, and his decision must be given in writing."

This rule will be most rigidly enforced.

H. CLAY GLOVER.

Veterinarian to the Westminster Kennel Club.

Gordon Setter Club of America.

THE annual meeting of the Gordon Setter Club of America will be held at Madison Square Garden on Tuesday evening, Feb. 22 (second night of the Dog Show), at 7:30 o'clock, for the election of officers and the transaction of such other business as may then come up. Members are requested to send in their annual dues (\$5) and the names of those to be proposed for membership to the secretary.

L. A. VAN ZANDT, Sec'y-Treas.,

No. 938 Prospect avenue, New York.

Alabama Field Trials Club Trials.

THESE highly successful trials were run at Madison, Ala., beginning Feb. 7. Winners of the Derby were: R. H. Lowe's Mack L., first; T. M. Spencer's Tony Dick, second; C. E. Meglemry's Rex of Birmingham, third.

All-Age Stake.—H. H. Mayberry's Alabama Girl, first; Rex of Birmingham, second; Tony Dick, third.

Puppy Stake.—Dan R., first.

Champion Stake.—Ashford & Odom's Von Gull, first.

A detailed report will be given in our next issue.

POINTS AND FLUSHES.

The premium list of the Northwestern Kennel Club can be obtained of the secretary, C. E. N. Howard, 48 East Fourth street, St. Paul, Minn. Mr. R. W. Mathews, a member of the bench show committee, writes us as follows: "We will pay out in cash prizes about \$2,000, including specials. The hall will bench 800 dogs. It is well lighted and ventilated on all sides. It is on a central corner, the best location in the city."

The Sun publishes an item in a recent issue as follows: "Los Angeles, Feb. 7.—The Coursing Club has debarred Dr. Van Hummell, of Indianapolis, from further participation in its matches. He is charged with having run in a 'ringer' on the club and beat the pool box. A week ago last Sunday Dr. R. S. Withers, a veterinary surgeon, entered a dog called San Pedro, and he was beaten. Yesterday San Pedro won everything in sight. Dr. Van Hummell, it is claimed, backed San Pedro heavily. The club has discovered that San Pedro is the imported Chit Chat, owned by Dr. Van Hummell."

Mr. C. E. Buckle, of the Charlottesville Field Trial Kennels, writes us as follows: "I found it almost impossible to find a location in Mississippi with enough birds to train on this spring, without going far South, and knowing there were lots in this State (North Carolina) last fall, I decided to come back. This is probably an unprecedented move on the part of a trainer, and it seems almost foolish to leave that pretty-looking Southern country, but as you know, we can do nothing without birds." Mr. Buckle is now located at Linwood, N. C.

Many tons of the Johnson biscuits have been shipped to the Klondike. They were only recently put on the market, but they sell like hot cakes. Those who have used them claim that they are good alike for dog and man, and excellent for either.

The field trial winner Count Gloster died on Jan. 29. He contracted distemper at West Point, Miss., and was for that reason unfitted for competition in the Continental Trials at New Albany, and for that reason was not run, as was mentioned in these columns at the time. He had been sold to the Verona Kennels at a long

price, and was to be delivered after the field trials were over.

Mr. C. E. Davis, No. 2 Market street, Boston, requests us to publish the following: "Champion Duke of Kent II. has strayed or been stolen from the Glen Rock Kennels, Ballard Vale, Mass. If any of the many readers of FOREST AND STREAM who know Duke will let us know if they learn of his whereabouts, we will be very thankful."

Mr. George H. Thompson, secretary, writes us under date of Feb. 10 that the annual meeting of the Irish Setter Club of America will be held at the Madison Square Garden, Feb. 22, at 8 P. M., during the W. K. C. show.

The Breeder and Sportsman of February, in its coursing notes, has this to say: "Coursing at Sacramento suffered a hard blow last Sunday. A kick against the decision of the judge resulted in something like a riot. The crowd attempted to pull the judge from his horse. The result was a sale of the fences, etc., and there will be a cessation of coursing in the capital city for several months." It would seem that sport on the coast is taken very seriously in the coursing world.

The show of the French Bulldog Club, held in the Waldorf-Astoria, New York, on Feb. 12, has been declared a gratifying success, so much so that the club will possibly make it an annual fixture. As a proposition entirely apart from this matter, the holding of two or more shows by different clubs in the same city is sure to bring trouble to the A. K. C. sooner or later. If it is permitted to one and refused to another, it then affords grounds for a charge of favoritism; if two or three or more clubs are given the same franchise, there is then Donnybrook possibilities.

Mr. George W. Clayton, superintendent of the Northwestern Kennel Club's show to be held at St. Paul, Minn., March 8 to 11, writes us as follows: "Through an error of the printer, the date of birth was left out of our entry blanks. There will be a winners' class for prizes." Those who make entries should therefore note that in filling out the blanks it is necessary to specify the date of birth of the dogs entered. Entries close March 1.

Mr. Howard Vernon's pointer dog Glenbeigh was poisoned at Bakerfield in the week during which the Pacific Coast trials were run. A chemist who analyzed the contents of the dog's stomach reported that he had found several pieces of meat containing arsenic. The conjecture is that he found and ate some poisoned meat which was intended for coyotes, but there is also an opinion that it was given intentionally.

Mr. A. E. Ashbrook, secretary of the Kansas City Kennel Club, writes us that: "The judges for our show, March 15-18, are Miss Anna Whitney, Lancaster, Mass.; James Mortimer, New York; P. T. Madison, Indianapolis; John Davidson, Monroe, Mich., and J. A. Graham, St. Louis. Our prize list will be out next Wednesday."

The entries to the W. K. C. show number 1,700 so far as heard from. A few more of the late stragglers may swell the total slightly. This is a record breaker. The entries are as follows: English bloodhounds, 20; mastiffs, 27; rough-coated St. Bernards, 103; smooth-coated St. Bernards, 30; Great Danes, 90; Newfoundland dogs, 7; Russian wolfhounds, 35; deerhounds, 5; greyhounds, 39; foxhounds, 10; pointers, 100; English setters, 68; Irish setters, 39; Gordon setters, 31; Irish water spaniels, 4; field spaniels, 31; cocker spaniels, 97; collies, 77; old English sheep dogs, 4; poodles, 60; Dalmatians, 5; bulldogs, 102; French bulldogs, 20; bull terriers, 120; Airedale terriers, 8; Boston terriers, 105; Basset hounds, 6; dachshunde, 37; beagles, 62; fox terriers, smooth, 94; fox terriers, wire, 69; Irish terriers, 53; Scottish terriers, 12; black and tan terriers, 18; Welsh terriers, 1; Skye terriers, 4; Dandie Dinmont terriers, 1; white English terriers, 3; whippets, 4; Shipperkes, 4; Pomeranians, 2; Yorkshire terriers, 14; toy terriers other than Yorkshire, 7; pugs, 16; toy spaniels, 43; Italian greyhounds, 2; miscellaneous, recognized breeds unclassified, 11.

Mr. William Gould Brokaw desires that there shall be no restrictions as to age of pointers that compete for the Brokaw challenge cups; also that the cups must be won three times instead of twice before becoming the absolute property of the winner. All dogs entered for competition must be benched consecutively according to their numbers in the catalogue. This will be rigidly enforced. Mr. Henry Jarrett offers a silver cup for the best field or Clumber spaniel stud dog shown with two of his get.

Readers are invited to send us the names of friends who might be interested in a current copy of the FOREST AND STREAM. We shall be glad to forward a specimen number to any person whose address may be furnished us for that purpose.

Yachting.

THE members of the Montreal Stock Exchange have shown a most commendable spirit in arranging to build a 20-footer for the defense of the Seawanhaka international cup next summer. The venture of the Royal St. Lawrence Y. C. in challenging for the cup in 1896 has become a national affair, the win of that year and the successful defense last year being achievements of which every Canadian may feel proud. It is but fair that the club, which solely by its own exertions has done so much for the national honor, should now receive assistance from without in its second defense of the cup.

SINCE the death of Mr. Ogden Goelet it has been an interesting question among yachtsmen whether the great annual trophies established by him would be perpetuated in his name by his heirs. Such, it now appears, will not be done, and the "Goelet cups" will disappear from yachting. At the same time their place will at once be taken by new cups of the same value, \$1,000 for schooners and \$500 for cutters, established by Mr. John Jacob Astor. At the annual meeting of the club two offers of such cups were made, the prior one being accepted.

So far as mere money goes, there is no lack of good prizes in yachting; men can always be found who will contribute liberally in this way, and the clubs, as in the case of the Larchmont Y. C. and its annual schooner cup, are always ready to offer prizes. The real need in yachting is not gold, but plain, common sand, the quality which impels a man to harden his heart and heave on his halyards when he knows that it is not "his day," for the sake of his club and to give his opponents a race. Without this, all the gold in the Klondike cannot help yacht racing.

The fate of the last Goelet cup is still undecided. As will be remembered, it was not awarded because it cannot be given in the rules for a sail-over, and no schooner in the New York Y. C. fleet would sail the course against Colonia and risk a defeat. It is said that the cup will be given by Mrs. Goelet as a perpetual challenge cup.

A Fin-Keel 25-footer.

THE recent attempt of the American Y. C. to establish a 25ft. l.w.l. one-design class brought out in the competition a variety of designs, one of which, the choice of the special committee, has already been illustrated in the FOREST AND STREAM. Another fin-keel design was submitted by Mr. George Hill, of the Atlantic Y. C., designer and owner of the keel sloop Akista, which design is here illustrated. The following summary of the principal points accompanied the plans and specifications:

Type.—I have presented a moderate fin-keel because it gives:

(a) Very large accommodations for moderate displacement.

(b) Very great strength of form (as here designed).

(c) Least possible resistance and so greatest possible speed for given waterline length and displacement.

(d) It is the most seaworthy yacht of which I have knowledge when properly designed.

(e) The balanced rudder gives great control, quickness in maneuvering, and still permits the yacht to sail for an hour at a time without change of helm.

(f) The short bowsprit enables one to get the anchor without marring the hull; it also brings the center of effort, center of lateral resistance, and center of waterline all in the same vertical. The main boom is easily reached from deck.

(g) With mast in water, the yacht floats so high as to keep water out of the cabin. She therefore cannot retain such an inclined position, and cannot sink.

Form.—The principles demonstrated as required for fast sailing are all met:

(a) The form remains the same under all angles of heel.

(b) The entrance and run are long, easy and symmetrical, and carried out far enough to prevent excessive wave-making.

(c) The form is not extreme.

(d) The midship section is one peculiarly adapted to a fin-keel, is very stable, and with a good freeboard makes a very dry yacht.

Construction.—The entire frame is fastened to an extremely rigid fin, bolted and strapped, that with the steel ribs the yacht cannot work or be injured except by being practically destroyed. The yellow pine skin makes a more durable and smoother job than a softer wood; more expensive to build, but less expensive to keep up. All rigging is specially designed for strength, lightness and ease of handling. All halyards lead aft to the cockpit.

Accommodation.—The main cabin sleeps two on transoms, two on berths. The decks are wide enough to use, and to carry the yawl free from all danger of being carried away. The cockpit is arranged to make the decks available, which is only possible in yachts of this type. The main cabin has 6ft. head room between transoms and over full length of floor.

The galley is large, with plenty of storage space. The ice box will hold 150lbs. of ice. There is a great deal of locker room in the main cabin, giving separate spaces for rubbers, oil skins, ropes, sails, etc. Water flows to faucets by gravity. The tanks help to make the hull non-sinkable.

The wide deck is of special advantage in racing.

The fittings are specially complete, including everything requisite for cruising or racing, except crockery, stores and bedding. See the specification. The displacement contemplates the carrying of stove, etc., and this makes it unnecessary and undesirable to strip the yacht to race.

The dimensions and details are as follows:

Length, over all.....	36ft.
Length, l.w.l.	24ft.
Depth, hull below l.w.l.....	2ft. 6in.
Least freeboard	2ft. 8in.
Head room, main cabin.....	6ft.
Head room over berths, main cabin.,	4ft.
Displacement	11,500lbs.
Weight, hull	4,000lbs.
Weight, spars, sails and fittings....	1,000lbs.
Weight, stores	1,000lbs.
Weight, keel.....	5,500lbs.
Area of lateral plane, hull.....	37.4sq.ft.
Area of lateral plane, rudder.....	6.0sq.ft.
Area of lateral plane, fin.....	35.0sq.ft.
	78.4sq.ft.
Sails, mainsail	640sq.ft.
Sails, jib	160sq.ft.
Sails, spinaker	350sq.ft.

The plans were accompanied by very complete speci-

fications, and a tender to build a fleet of ten to twelve yachts, each completely rigged and fitted with anchor, cable, davits and dinghy, for \$1,250 each. The construction is a novelty in that the main keel, or at least its middle portion, is cast as a broad flange on the upper edge of the fin, being 10ft. long, 2ft. wide and 3/4in. thick. The remainder of the keel forward and aft is composed of two oak pieces each 4 by 8in., bolted to the fin casting. The stem is of oak, sided 3in., and the transom of 1 1/4in. mahogany. The garboards are of 1 1/2in. yellow pine, 8in. wide, and the rest of the planking of the same material, 1in. thick and not more than 8in. nor less than 3in. wide. The frames are in part of steel angles, 1 1/2x1 1/2x3-16in., eleven on each side; the rest being of bent oak, sided 1 1/2in., moulded 2in., the spacing throughout being 12in. The chainplate frames are sided 4in. Strong oak floor timbers are used, carried up to the cabin floor. The sheerstrake, planksheer and partner planks are of oak. The deck beams are of bent oak, partner beams sided 4in., moulded 2in.; other beams 1 1/2x1 1/2in., with beam at fore end of house sided 2 1/2in. The clamp, of yellow pine, is 1 1/4in.x6in.

The cabin trunk is of bent oak, with after bulkhead and cockpit staving of matched cypress. The companion and fore hatch are of mahogany and the interior trim of cypress. The plumbing includes yacht w. c., two tanks of 20 gallons capacity each, and bilge pump.

The special features of the design were very fully discussed by Mr. Hill in a letter published in the FOREST AND STREAM of Nov. 6, 1897.

The North American Y. R. U.

ON Saturday last Mr. Emilius Jarvis arrived in New York from Southampton on the steamer St. Louis, of the American Line, being thus one of the witnesses of the exciting rescue of the passengers and crew of the steamer Veendam, sunk at sea by collision with some unknown obstruction. Mr. Jarvis sailed from New York early in November, immediately after the organization of the North American Yacht Racing Union, with which he is identified as a member of the council, Mr. J. M. Macdonough, another member, accompanying him. Both went abroad on private business, but the opportunity thus offered was utilized by the Y. R. U. to make overtures toward future harmonious relations and united action in yachting legislation with the British Y. R. A. The two delegates were instructed to present to the Y. R. A. the plans and objects of the American organization, and to suggest the desire of that association for a common rule of measurement on both sides of the Atlantic, should any rule be found which would be acceptable to both parties.

Very brief reports of the movements of the delegates and the nature of their reception have been received here, and Mr. Jarvis' return (Mr. Macdonough being still abroad) was awaited with much interest. At his suggestion by letter, a meeting of the council was called for Saturday evening, the St. Louis being due early in the morning. Being naturally in a hurry to reach his home in Toronto, Mr. Jarvis had planned to take a train early in the evening, after devoting a couple of hours to the meeting. Owing to the dense fog the St. Louis did not reach her dock until afternoon, but Mr. Jarvis was at the Imperial by 7:30, when the first of the members arrived. It was considerably later before the meeting convened, there being present Messrs. F. Bowne Jones, N. D. Lawton, A. D. F. Bancroft and A. J. Prime. Mr. W. P. Stephens, of the Seawanhaka C. Y. C. special committee on measurement, was present by invitation.

Mr. Jarvis had not prepared a written report, but he told a very interesting story of his trip, reading several letters and exhibiting a number of sketches of midship sections of successful yachts of the past two seasons. In the first place he and his associate were provided with letters to Mr. Dixon Kemp, Secretary of the British Y. R. A., which letters were forwarded to Mr. Kemp on arrival in London. Mr. Kemp was seriously ill at the time, and the letters were not acknowledged, and as it appears, were not laid before the Y. R. A., though an invitation to attend a meeting of the Association was received from the Hon. Treasurer, Mr. Lake. As Mr. Macdonough was called to the continent, Mr. Jarvis alone appeared before the meeting, which, owing to the absence of the letters of introduction, was ignorant of the details of his mission. He was treated very courteously, and asked to address the meeting, but after a few questions as to whether the New York Y. C. and the Eastern Y. C. were connected with the new association nothing more was said, and the meeting was over.

Later on, however, Mr. Jarvis, in the course of social meetings with members of the council of the Y. R. A., came to realize that the object of his visit was misunderstood, and thus had failed to awaken any interest and response on the part of the Association. Mr. C. Newton Robinson interested himself in the matter, and arranged for a special general meeting of the Y. R. A. to meet Mr. Jarvis; but after chasing the latter to Scotland and back to Birmingham the invitation was received too late for him to attend the meeting. It was proposed to call another meeting after Mr. Jarvis' private business brought him again to London, but instead of this at his suggestion several social meetings of members of the council were held. In the course of these the history of the new American organization, its numerical strength and nationally representative character, were laid before the British yachtsmen, as well as its general wishes as to a new measurement rule. The response was most gratifying, there being a general recognition of the desirability of united action, and a desire to further it.

As to the details of measurement, the opinion was unanimous that the present Y. R. A. rule, after two seasons of trial under the actual test of building and racing, was producing the type of yacht which it was expected to encourage. Both the members of the council and the designers were unanimous on this point. The suggestion was made that the American Association should adopt the Y. R. A. rule or one similar to it as an experiment, with the probability that after one or two seasons of trial the two nations might be able to unite in harmonizing any differences then existing in the rules.

The council gave Mr. Jarvis letters to the designers, with special requests that they would furnish him with all information as to their new yachts, and sketches showing the types. In the course of the winter Mr. Jarvis has met Messrs. Watson, Fife, Soper, Payne, Hope

and Nicholson, discussing the action of the present Y. R. A. rule with all of them. He also visited Mr. R. E. Froude at the experimental station at Haslar. He has seen nearly all the newer yachts on the Clyde and Solent, with the innumerable old ones. He was most enthusiastic over the 52ft. L.R. Penitent, designed by Arthur E. Payne in 1896, a very successful racer, and yet with admirable accommodations for a boat of 47ft. l.w.l. He exhibited a number of midship sections of successful boats, from Bona down to 18-footers, by the designers above mentioned, all showing rather full sections, and with moderate draft, except in the case of a few small racers. After a very pleasant evening the party escorted Mr. Jarvis to the midnight train for Toronto. As soon as his business permits he will prepare a written report to the council, which will be published. From his verbal report it would appear that his mission had been quite as successful as was possible under the circumstances, and that it opens a promising prospect for international friendship and harmony in yachting.

DESIGN FOR 25FT. L.W.L. KNOCKABOUT, BY GEORGE HILL, ESQ., 1897.

Through the Sound in an Oyster Sloop.

(Concluded from page 135).

WE passed well to the north of Bartlett's Reef Light Vessel at 6 bells. Although we knew the water to be very shoal on the reef, in places, yet we took our chances of striking bottom, but got through all right.

While we were off Niantic Bay, the wind hauled still further to the north and came down on us in shrieks. The only attention we paid to it was to start sheet a trifle and head truer to our course. We thanked our stars, though, that it was not west or southwest instead of off the land. As it was, we received a dusting that drenched us to the skin.

We were half way across the entrance to Niantic Bay, when we heard the rumble of heavy ordnance. A few seconds later, and four downy puffs, drifting against the azure heavens a mile away, showed where the shells had burst. The Connecticut National Guard was in camp at Niantic, and the soldiers were drilling with the mortars. Again and again fluffy puffs of smoke from bursting shells drifted away in the distance, and the heavy rumble of the mortars sounded like an advancing thunderstorm. We watched the firing for some time. I wondered how the boys of Company D, Second Regiment, of which I was once a member, were enjoying themselves.

It was 5 o'clock when we passed to the north of the black buoy which marks Hatchett's Reef. The wind was still blowing very hard, and we were certainly meeting more sea than we had seen that day. The cause of this was a heavy swell which rolled out of the southwest against the wind. It showed that the wind had been blowing heavily in the Sound from southwest all day. Possibly it had been kicked up by the thunder squall we noticed that morning which passed out to sea off Montauk Point.

Off the mouth of the Connecticut the water was alive with immense schools of menhaden. Half a dozen menhaden steamers were making great hauls of fish. We passed close to a vessel which lay alongside a large seine, and every time she dipped her scoop-net into the seine it would come out loaded to the brim with squirming fish. As they were dumped into the vessel's hold they glittered in the rays of the sun like a shower of gems.

We were in the midst of an extra large school of the fish, when a sea serpent poked its slimy head above the waves. As it made toward Susie with wide-open jaws its forked tongue shot in and out its mouth in a frightful manner. We, however, were cool and not afraid in the least, for the serpent measured only 18 or 20 in. He was a common, everyday little water snake, and he must have felt very frightened and lonesome away off there, for he was fully two miles from land.

"If it wasn't for the delay I'd pick the little devil up," said Sam, who has always manifested an affection for the snake family that I can't understand.

Cornfield Point bore over a mile northwest when the sun sank in a blaze of glory. The wind died completely with the sun, and we were left rolling on the short, nasty swell. The roar of the surf on Guard House Point was the loudest we had heard, barring Napeague Beach. Gradually the soft afterglow in the western heavens darkened into night. The stars stole forth one by one, and the lighthouses began to twinkle. As Stanley set the port and starboard lights a breeze, faint at first, but gradually increasing in strength, came out of the north. Then Susie commenced to plow on her way again. "It's one of those night winds," said Sam, quietly. "And it'll probably hold steady until we reach New Haven."

Although Susie went swinging over the dark surges at a good clip, yet it seemed we would never put Cornfield Point Light Vessel over the stern. We could easily tell by the lights ashore that we were passing the land rapidly, but the twinkling eyes of the light vessel hung tenaciously on our sight, over the port quarter. It was a great relief to us when the white, flashing orb on Faulkner's Island could be seen lifting and dipping on the dusky sea-line far down in the west.

After a hot cup of tea and a hastily snatched supper of pilot biscuit, cold beans and canned apricots, I slipped an old overcoat over my sweater and took a seat just forward of the mast, in the bows of the sloop. I was determined to keep a vigilant watch ahead. Bub and Stanley turned in. Sam held the tiller. Have you, gentle reader, ever reclined in the bows of a small boat when the breeze was strong and the darkness of night about you? The incidents of that night's vigil formed a memory-picture which the combined skill of the world's greatest artists could not reproduce on canvas. Neither could the pen of any writer, however eloquent he might be, describe that picture as it was; therefore, with my poor pen, I can give but a rough idea at the best. The steady breeze inclined Susie's deck at an angle that just pressed her lee rail to the dark water's edge. The green rays of the starboard light mingled a faint emerald tint with the delicate red bars that fell on the deck from the port light, forward of the mast. So soft was this intermingling of colors that it threw a strange, mellow radiance about the foot of the swelling jib, halyards, chain cables and windlass, causing them to appear phantom-like and unreal. The dusky surges, advancing in monotonous regularity out of the darkness, seemed like shadowy, restless beings of the solemn sea. The steady s-wash, s-wash under Susie's inclining bows mingled a mysterious chant with the vesper-like hum of the night wind whispering through the rigging. As our little craft swept rhythmically onward, the parted seas gleamed ghostly on either side of the cutwater for a moment, then vanished in the darkness. Lights twinkled along the dark shore-line, and I saw a small lighted balloon ascend skyward from some shore resort. Then the northern lights sent nervous, transparent feelers to the very zenith of the spangled heavens, and the stars shone ghostly through the pale streamers of light. Suddenly, from far down in the southwest, a narrow, phosphorescent ribbon of light shot from the surface of the water and penetrated the uttermost limits of the heavens. It danced crazily up and down, up and down, then shot this way, then that. "What in heaven's name can that be?" I murmured, rubbing my sleepy eyes with my knuckles. "It's the searchlight of one of the large Sound steamers," said a voice so low as to seem but an answering echo to my murmur. I had been away from the water so long that this was the first time I had ever seen one in operation.

It was 11 o'clock before Faulkner's Island Light was abeam. The wind, which had held so steady, now died to a mere whisper, and Susie made but little progress. Searchlight rays crossed and recrossed the heavens, and searched the waters far and near, as the fleet of Sound steamers approached. They passed us about 7 bells, and the flash and glitter of their hundreds of different colored lights formed a sight of dazzling brilliancy.

"There's a big fire somewhere ashore, astern." It was Sam's voice, and he had spoken for the second time since I took my station forward.

"Where is the fire? I don't see anything but the moon rising."

"Well, I'll be hanged if I didn't think it was a fire."

"Who says fire?" asked Stanley, poking his head out of the companionway. "You'd better go below and turn in. You've been at the tiller steady for more than ten hours."

Sam kicked at first, but when Stanley and I insisted that he turn in for awhile he finally yielded. He had a very hard cold, and was very hoarse. I'm sure he felt miserable. Stanley wanted me to turn in, but with the exception of feeling so sleepy I could hardly keep my eyes open I felt pretty good, so decided to stay on watch until we should make New Haven.

The wind held light for over an hour, then it came good and strong out of the north again. A silvery crescent hung suspended in the dark heavens, and looked more like a photograph of the original than like the moon itself. Excepting where its wake faintly silvered the dark waves, it apparently cast no light at all. So deep was the dark appearance of the firmament that the stars, too, seemed brilliant gems hung in a sable dome.

It seemed we never would make Southwest Ledge Light; yet at times I would start up and strain my eyes in the direction of the breakwater, for we would seem on the point of running on top of it. Then I would find that drowsiness had caused the illusion, and that I had nearly fallen asleep on watch. Finally, however, the light appeared to grow and grow in size and to lift higher and higher. Then, when it appeared we were rushing with breathless speed into the maw of a huge, dim monster that looked down upon us with a single, glaring eye of white, Susie rushed by the end of the breakwater and stood off on the port tack into the harbor.

How I managed to keep awake until we came to anchor off the end of Long Wharf I do not know. I have a dim recollection of seeing Sam on deck, and of hearing the rattle of chain cable and halyard blocks. Then some one said: "There's the morning star, over Fort Hale, and it's just 3 o'clock." The next thing I knew I awoke and found the sun flooding the cabin down the companionway. It was 9 o'clock, and I was already dressed, for I had turned in "all standing."

As our outing was near an end Bub decided to leave us; so about noon I rowed him, and his belongings over to the wharf. We watched him trudging up the long wharf with a valise half as large as himself until he disappeared from view.

About 1 P. M. we got our anchor and started down the harbor. The wind was south and very light, but the tide favored us to the mouth of the harbor; then, of course, we had to sail against it.

The afternoon was bright and balmy, and the green shore-line, covered with summer cottages, never looked more beautiful. The bosom of the Sound shimmered under the mellow rays of sunlight. While there was not weight enough in the wind to send us along at any speed, yet it blew just strong enough to make it a delight to loaf about the deck. It was 5 bells before we passed Southwest Ledge, and 7 bells by the time we reached Charles Island. We had nearly overhauled a large three-masted schooner that was having a dubious time of it poking against the tide in the light air. When we left our anchorage she was fully two miles ahead of us. Half a mile to windward a large sloop yacht appeared to be having much more wind than the schooner or Susie. She heeled more and more, and we congratulated ourselves on the prospect of getting a good breeze. Presently her crew was compelled to shorten sail, and she had hardly taken in her topsail and jib-topsail when the schooner got it.

"We'll have a dusty time of it, inside half an hour," said Sam. "Just see the old three-master now! She's sailing light, and I'll bet her topsails 'll come down before long." He spoke truly, for before the wind reached us the schooner rolled down at such an angle that her crew commenced to shorten sail. She was a quarter of a mile to windward of us when we got the wind.

We hadn't made 100 yds. after the wind struck before we realized that it was a sure enough case of shorten sail. Hard, fierce and puffy came the wind out of the southwest. At first it flattened the sea; then steep, chunky, leaden waves arose, and the wind caught briny spray-patches from their crests and hurled them with stinging force into our faces. With trip-hammer force Susie pounded incessantly into the advancing hillocks and smashed their crests into yeasty foam. Slowly but surely she ate her way to windward of the three-master, and as we hung to the starboard tack for more than six miles we found, when we went about, that we had beaten the schooner more than two miles. We had also hauled up on the sloop yacht so fast that she was no more than a quarter of a mile ahead of us. She was a much larger craft than Susie.

After swinging on to port tack we found it even wetter than on starboard. By hard pinching we just managed to head our course. As wind, sea and tide were against us, we were glad to don old coats; and even they didn't save us from a drenching.

The Middle Ground Light lined over Susie's port quarter at 6:30. By this time the wind had hauled a trifle to the south, and we were enabled to lift a little sheet. "Look!" said Sam, suddenly. "See the man-o-war! Over under the Long Island shore, there!" We looked to where he pointed, and saw a large, handsome, square-rigged steam vessel well down to the south of us. She was swarming through the water at great speed.

"That's no man-o-war," said Stanley. "I've seen her before. She's Slater's yacht, of Norwich. I tell you, she's a 'beaut,' too!" She certainly did make a beautiful

appearance as she swept grandly on her way. All hands agreed that she would make a fine auxiliary cruiser in time of war.

Penfield Reef Light bore east of north at 7 bells. Susie was "horsing" along at a good eight-knot clip. The sun had set bright enough, but without warmth; and there was a hard look about him which plainly indicated wind. The western sky was entirely devoid of those sunset colors so pleasing to the eye. The wind held hard and strong and was almost south. The sea still rolled up in leaden lumps. Of course, the farther west we ran, the narrower grew the Sound; therefore the waves did not increase in size.

Night settled down as dark as a pocket. We could see the stars, it is true, and the gleams from the light-houses were plainly visible. They had a look about them, however, as they would had we seen them through a veil. The atmosphere seemed thick and heavy, and dusky blobs, with ill-defined edges, floating here and there in the dark heavens, showed that the sky was not entirely cloudless. A look into the water over the stern revealed a trail of phosphorescent sparks, dancing and tumbling erratically away into the darkness. Green and red, eye-like points peering out of the darkness here and there showed the course of numerous vessels, and the Sound steamer fleet made its presence known by sending ghostly searchlight rays across the ebony waves.

"If this wind holds an hour and a half longer, we'll be anchored in Indian Harbor, and the trip 'll be ended." Sam's words sent a pang of regret to my heart. The full significance of what they meant struck with double force at that particular time, for then we were reveling in freedom. The full realization that this freedom would end with the dropping of the anchor, and that confinement and toil would begin, came like a sudden blow. Already I could hear the clank and pound of hammers, the whir, rush and grind of machinery; the squeaks and shrieks of slipping belts rang in my ears, and it almost seemed I could scent heated oil and steam pipes. I failed to realize at the time that such conditions are what cause outings to be appreciated to their full value, and that to thoroughly enjoy freedom one must experience confinement.

Stamford Light glowed like a living coal over our starboard quarter at 9:30. The wind still blew strong and steady, and a dash of rain came out of a black cloud that hovered overhead. Soon Greenwich Point was abeam, and as we were more than two miles off shore, more sheet was lifted and Susie fairly tore on her way through the inky seas. When we came up with the point a sharp lookout was kept for the light that burns on the gas buoy to the east of Little Captain's Island. We failed to find it, however, but passed into the harbor without incident. Soon the glowing lights of Com. Benedict's palace opened to view, and it was just 10:30 P. M. when Susie swept by the western end of Tweed's Island. Ten minutes later her anchor was down, her sails snugly stowed, and the gallant little vessel that had carried us safely through a trip not entirely devoid of danger slept peacefully on the quiet waters of Indian Harbor.

WILLIAM H. AVIS.

Cabin Fittings in Small Cruisers.

THE subjects brought forward in the following letter have frequently been discussed in the FOREST AND STREAM; the stove question in particular, as concerns small yachts, single-handers, canoes and camping, was covered very thoroughly about a dozen years since. The information then given by different yachtsmen, canoeists and campers is of course out of date by this time in the matter of patented oil and vapor stoves; as very great improvements have been made, especially in the invention of the "blue flame" kerosene stove, which has replaced the old wick stoves. In our issue of April 10, 1897, in answer to an inquiry, a correspondent recommended a new stove, the "oil gas," burning kerosene, and mentioned a promise of a still better one during the then coming summer.

We will be very glad to receive any information on either subject, cabin arrangement and fitting up, furnishing and stoves for small yachts. The majority of cruising yachtsmen are directly and personally interested in both, and a discussion cannot fail to benefit them. Where space is as limited as in a 21 or 25-footer, its best possible utilization is a serious problem.

ERIE, Pa., Feb. 3.—*Editor Forest and Stream:* We have had a great many articles descriptive of the 21ft., 25ft. and knockabout classes lately, but the subject of arrangement of space in cabin, convenient and indispensable articles for outfit, and especially the type of stove best suited for them, has received little notice. This is a subject of great interest to many of your readers who own or are building in those classes, and I am certain that an article throwing some light on it would find many appreciative readers.

The kind of stove to use is a "burning" question to those of us who intend cruising in such craft, and one that I have not seen discussed in any book or periodical devoted to yachting.

F. W. GRANT.

Government Tests of Timber.

It is surprising that in these days, when the strength of all structural material is carefully determined, we should possess such imperfect knowledge of the strength of the various woods which are used in construction and manufacture. There is lacking to-day a thoroughly reliable table of the strength of woods. We say this with the full knowledge that all the text books and engineers' and mechanics' pocket books give such tables; but unfortunately the data upon which they are founded is not of that comprehensive or scientific kind which alone can give such tables their proper value. Most of the investigations of the strength of timber already made have been carried out by individuals who had neither the time nor the means to do the work as thoroughly as it should be done. The first investigation of the subject on an adequate scale is now being carried out by Dr. B. E. Fernow, of the Forestry Division of the Department of Agriculture. To examine and test a sufficient number of specimens of any given species is a costly undertaking; but the Department has shown good judgment in preferring to expend its appropri-

tions in doing thorough work on a limited number of species rather in doing more or less superficial work upon a larger variety.

During the past year, owing to the failure of the Government to provide funds for carrying out this work, Dr. Fernow rented a testing machine with which to carry on his investigations. In the course of his work he made the important discovery that a constant mathematical relation exists between the compressive and the tensile tests of any species of timber, and that henceforth it will be sufficient to make a laboratory compressive test, the tensile strength being calculable from the data so obtained. Dr. Fernow gives the credit for this important discovery to Mr. S. F. Neely, one of his assistants. It is needless to say that the cost of completing the investigation of American woods will be greatly reduced, and it is to be hoped that Congress, encouraged by this fact, will grant the appropriations asked for the coming year's work.—*Scientific American*.

Dr. Fernow will be remembered by canoeists as one of the old Mohicans, when the club was in its glory; an old-time canoe cruiser. This important work could not be in better hands, as Dr. Fernow is an expert in forestry.

New York Y. C.

The annual meeting of the New York Y. C. was held on Feb. 10, with Com. Morgan in the chair. The following officers were elected: Com., J. Pierpont Morgan; Vice-Com., Lewis Cass Ledyard; Rear-Com., August Belmont; Secy., J. V. S. Oddie; Treas., F. W. J. Hurst; Meas., John Hyslop; Fleet Surgeon, Morris J. Asch, M.D.; Regatta Committee: S. Nicholson Kane, Chester Griswood and Irving Grinnell. Committee on Admissions: Edward M. Brown, C. Oliver Iselin, Lewis Cass Ledyard, W. Butler Duncan, Jr., and James A. Wright. House Committee: Tarrant Putnam, C. L. F. Robinson and Frank M. Cronise. Library Committee: Fordham Morris, Arthur H. Clark and Theodore C. Zerega. Committee on Club Stations: William H. Thomas, H. Benedict, F. Augustus Schermerhorn, L. Vaughan Clark, Tarrant Putnam, Frederick F. Sands, Harrison B. More, John F. Duncan, Amzi L. Barber and Edward K. Ladew.

The following new members were elected: W. R. Patten, Isaac Stern, Albert S. Bigelow, Butler Ames, Samuel F. Houston, M. F. Plant, Alfred H. Benschaw, Joseph K. Campbell, U. S. N.; Ammen Farenholdt, U. S. N.; Charles M. Schott, Jr.; Clarence M. Busch, G. W. Denfeld, U. S. N.; Robert E. 10d, Francis Wyckoff Belknap, John L. Thompson, F. Hamilton Burch, David Wilcox, Abram Baudouine, John A. Richmond, John B. Rhodes, Edward Prime and Walter S. Hoyt.

The following memorial was read and it was voted two engrossed copies be made, one to be presented to Mrs. Goelet and one to be hung in the club house:

Ogden Goelet died on board the Mayflower off Cowes, England, on Aug. 27, 1897.

Ogden Goelet joined the New York Y. C. in 1880, and was always conspicuous for his keen sympathy with the traditions of the club as well as the active interest that he displayed in all that concerned the highest development of yachting.

For sixteen consecutive years, commencing in 1882, Ogden Goelet has presented to the club a cup for schooners and a cup for sloops, to be sailed over an ocean course off Newport, R. I., open to vessels comprising the squadron of the N. Y. Y. C., on its annual cruise.

The races for these cups were of national interest, and their possession was eagerly sought in many of the most stirring contests that are recorded in yachting annals.

Mr. Goelet's engaging personal qualities and his enthusiasm for yachting made him one of the most popular and valued members of the club, and this tribute to his memory is an expression of the high regard and sincere esteem in which he was held by his fellow members of the N. Y. Y. C.

S. NICHOLSON KANE,
LLOYD PHOENIX,
GEORGE L. RIVES.

It is known that the annual gift of the Goelet cups will not be continued by Mr. Goelet's family, though the schooner cup given by him last year and not awarded owing to the lack of competition, will probably be presented to the club as a challenge cup. The following letters offering new cups were read and the offer of Mr. Astor was accepted:

J. V. S. Oddie, Secretary New York Y. C.:

Dear Sir—I am told that unless Ogden Goelet left provision in his will for continuing the Goelet cups for the Newport races they may be discontinued.

This would be a great pity, and very likely he has provided for them.

If he has not, however, I should be glad to continue them, giving the same kind of prizes, to be called the Astor cups, and sailed for at same time and place.

Please let me know what you think of this, and refer it to the committee having charge of the matter.

I shall be glad to continue the cups during my life, and to make provision for the races in my will. Yours very truly,

J. J. ASTOR.

J. V. S. Oddie, Esq., Secretary New York Y. C.:

Dear Sir—In the event of the non-continuance by a member of the family of the Goelet cups I desire to offer to the New York Y. C. two cups of the same value as those heretofore presented by the late Capt. Goelet. * * *

Should any foreign yachts be in these waters during the time of the event I reserve the right to invite the same to compete. The commodore and the regatta committee shall have the same privilege. Otherwise the racing rules and time allowance of the club to govern.

W. GOULD BROKAW.

The date of June 16 was selected for the annual regatta. The club now numbers 1,273 members, and 364 yachts are enrolled in its fleet.

YACHTING NEWS NOTES.

One of the small schooners designed by Messrs. Smith and Barbey is for Alfred N. Chandler, of the Corinthian Y. C. of Philadelphia. She will be built by A. C. Brown & Son, at Tottenville, Staten Island, her dimensions being: 43ft. l.w.l., 18ft. beam, and 4ft. 9in. draft.

The proposed cruise of the steam yacht Nourmahal to the Mediterranean is abandoned, and on Feb. 13 she sailed from New York for Honduras.

The annual meeting of the New Rochelle Y. C. was held on Feb. 7 at the Hotel Manhattan, New York, the following officers being elected: Com., Henry Doscher, cutter Banshee; Vice-Com., Joseph Fallert, sloop Wanita; Rear-Com., E. T. Birdsall, cutter Kelpie; Secy., O. W. Meyrowitz; Treas., A. W. Cross; Meas., F. R. Farrington; Trustees, three years: Wilson Godfrey, Eugene Lambden and Harry J. Meyers; two years: H. H. Todd and George W. Fuller; one year: R. M. Hyde, Jr. Law Committee: C. E. Kene and J. F. Lambden. Regatta Committee: P. A. Meyrowitz, J. C. Lippencott, L. Talbot, J. W. Rough and A. P. Weston. The annual regatta will be sailed on Saturday, July 2.

On Feb. 7 the Staten Island Y. C. held its annual meeting at the club house, Stapleton, the following officers being elected: Com., Charles F. Hicks; Vice-Com., E. F. Wiegand; Secy., Edward S. Seguire; Treas., E. W. Simonson; Meas., Adolph Rannick; Trustees: C. L. Boswick and Charles Winsch. E. W. Simonson, who has served as treasurer for eight years, received a handsomely engraved solid silver loving cup on behalf of his fellow members.

Rifle Range and Gallery.

Nitro Powder in Rifles.

NEW HAVEN, Conn.—*Editor Forest and Stream*: We think you will find our little circular in regard to reloading smokeless powder rifle cartridges interesting, and trust that you may deem it worthy of publication. As you will note, this information is based upon reports of the United States Ordnance, and can be relied upon:

"We are constantly in receipt of letters of inquiry regarding

the reloading of smokeless powder rifle ammunition, and we therefore make the following general statement:

"It has been the common experience of persons using reloaded smokeless powder cartridges to have a large number of shells so reloaded rupture in the gun. Extensive experiments carried on by the Winchester Repeating Arms Co. and by the Ordnance Department of the United States Army with shells, guns and smokeless powders of nearly every known manufacture have alike failed to find a remedy for this difficulty. Experiment shows that after the first firing with smokeless powder the metal of the shell undergoes a slow, but decided, change, the exact nature of which the best experts have as yet failed to determine. No immediate deterioration attends the shooting of smokeless powder, for by reloading and shooting immediately the shells may be shot many times with no sign of rupture. If, however, the fired shells are allowed to stand for two or three days, no matter whether they are cleaned or uncleaned, wet or dry, loaded or unloaded, the result is always the same, namely, the metal becomes brittle, and rupture of the shells at the next discharge is probable. Various proportions and kinds of material used in the manufacture of the brass have been tried. The brass has been subjected to physical tests to determine its tensile and crushing strength; chemists have examined shells before and after firing to determine the exact corrosive effect of the gases of combustion; the products of combustion of various powders have been carefully analyzed; experiments have been made to ascertain if galvanic action is responsible for the brittleness; but all to no avail. Experiments show that this brittleness is characteristic of all smokeless powders, and is in no way due to the material used in the shells, process of manufacture or kind of gun used. No manufacturers of rifle ammunition are to-day able to successfully and satisfactorily produce a smokeless powder shell suitable for reloading, and for this reason the Winchester Repeating Arms Co. cautions its patrons against the reloading of smokeless powder rifle ammunition, and wishes to do its utmost to discourage this practice.

"In confirmation of the above statements, we quote from Lieut.-Col. J. P. Farley, commander of the Frankford Arsenal, in his report to the Chief of Ordnance, U. S. A., under date of June 19, 1896 (Report of the Chief of Ordnance, 1896, p. 85), in which he says: * * * 'That the newly discovered defect of brittleness in fired .30cal. cases is confined to no special metals or modes of manufacture, but is liable to develop in any case that has been fired and allowed thereafter a period of rest.'

"Under date of Sept. 21, 1896, Lieut. L. M. Fuller, of the Ordnance Department, U. S. A., reports to the commander of the Frankford Arsenal (Report of the Chief of Ordnance, 1896, p. 85): 'From the very extensive experiments made at this arsenal it is evident that no cases manufactured up to the present date are fit for reloading as ball cartridges. It is even a question as to whether it is advisable to reload as blanks the fired cases manufactured up to the present date, for while several thousand have been so reloaded as blanks, it must be expected by the department that from 3 to 5 per cent. of these will split in the body of the case.'

"Again, Lieut.-Col. J. P. Farley, commander of the Frankford Arsenal, in his report of Sept. 24, 1896, to the Chief of Ordnance, U. S. A. (Report of the Chief of Ordnance, 1896, p. 85), says: 'The employment of our product up to date for reloading as ball cartridges is shown by the within report to be out of the question. Therefore it is that I respectfully recommend that no cartridge cases manufactured up to the present date be used for reloading as ball cartridges, and that only the best selected be employed for blank cartridges.'

"The construction of all Winchester guns is such that a ruptured shell can in no way injure either the shooter or the gun.

"WINCHESTER REPEATING ARMS CO.,
"New Haven, Conn., U. S. A."

Zettler Rifle Club.

NEW YORK, Feb. 14.—The shooting programme of the annual gallery prize shoot under the auspices of the Zettler Rifle Club, 219 Bowery, New York, beginning Feb. 20 and ending on Feb. 22, provides two events, both open to all comers. The first will be on the 25-ring target. Any .22 short cartridge allowed. Tickets of three shots, thirty-five cents. Tickets unlimited, but only one prize obtainable by one shooter. There are eighteen prizes, ranging from \$25 to \$2. A premium of \$3 will be given for the five best tickets: \$2 for the three best. The second event is the bull's-eye target. Three shots, 50 cents, on 4in. bull's-eye. Entries unlimited, but only one prize by one shooter. Best single shot to count by measurement. There are twelve prizes, ranging from \$15 to \$1. For the most points, \$3; second most points, \$2. The committee are Reinhold Busse, chairman; H. Holges, L. P. Hansen, C. Zettler, Jr., W. A. Hicks, Gus Nowak, secretary; B. Zettler, shooting master.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Feb. 15-19.—Hot Springs, Ark.—Second annual midwinter tournament. First four days, targets; last day, live birds. \$1,100 added money. Programmes ready Jan. 15. Send your address for one to Jno. J. Sumpter, Jr., Box 111, Hot Springs, Ark.

Feb. 17.—Lyndhurst, N. J.—Open sweepstake at live birds on the grounds of the Lyndhurst Shooting Association; 25 birds, \$10 entrance, birds extra. Take Erie to Rutherford, or the D., L. & W. to Lyndhurst. T. W. Morley, Secy.

Feb. 18-20.—Davenport, Ia.—Merchandise tournament of the West End Gun Club. L. Haneman, Secy.

Feb. 20-22.—Tucson, Ariz.—Fifth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Blue Rock Gun Club, of Tucson.

Feb. 22.—Atchison, Kan.—Tournament of the Atchison Gun Club. Live birds and targets.

Feb. 22.—Buffalo, N. Y.—Invitation target shoot of the Bison Gun Club.

Feb. 22.—Sistersville, W. Va.—Tournament of the Sistersville Rod and Gun Club.

Feb. 22.—Pawling, N. Y.—Tournament of the Pawling Gun Club.

Feb. 22.—New Haven, Conn.—Tournament of the New Haven Gun Club; targets. W. H. Hazel, Secy.

Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club at North Pond Shooting Park; targets. V. D. Kenerson, Secy.

Feb. 22.—Bound Brook, N. J.—Opening shoot of the Bound Brook Gun Club. Live birds.

Feb. 22-23.—Lexington, Ky.—Tournament of the Lexington Gun Club; targets, crows and pigeons. V. K. Dodge, Secy.

Feb. 22-23.—Buffalo, N. Y.—Second annual midwinter tournament at Audubon Park, under the management of E. W. Garbe. Targets. \$50 added.

Feb. 22-23.—Henry, Ill.—Tournament of the Henry Live Bird Club at the Big Four Driving Park. Targets and live birds.

March 8-10.—St. Thomas, Ont.—Tournament of the St. Thomas Gun Club. Targets and live birds. Added money, and an international live-bird trophy. Under the management of Jack Parker.

March 15-18.—Utica, N. Y.—Tournament of the Oneida County Sportsmen's Association. Live birds and targets. Open to all. Henry L. Gates, Pres.

March 22-23.—Stanhope, Ia.—Central Iowa shooting tournament, for amateurs only. Gold medal representing Iowa championship. Manufacturers' agents allowed to shoot for price of targets and birds.

March 22-24.—Elkwood Park, Long Branch, N. J.—Interstate Association's sixth annual Grand American Handicap. 25 birds, \$25, birds extra; \$1,500 guaranteed to the three high guns; \$600, \$500 and \$400; all surplus added.

March 28-30.—Galena, Kans.—Interstate shoot. Two days targets; one day live birds; \$50 a day added. W. W. McIlhany, Secy.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Secy.

April 5-8.—Baltimore, Md.—Annual spring tournament of the Baltimore Shooting Association. Geo. L. Harrison, Secy-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Secy.

April 7-9.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting park, under the management of J. A. Corry.

April 13-15.—Atchison, Kan.—Manufacturers' fourth annual tournament. Added money later. Jack Parker, Manager; Lou Erhardt, Secy.

April 19-22.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets: \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, manager. Address all communications to J. L. Head, Peru, Ind.

May 17-20.——.—Tournament of the New Jersey State Sportsmen's Association. T. H. Keller, Secy.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Secy.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Secy.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Secy.

June 8-9.—Findlay, O.—Annual tournament of the Magatrap Gun Club. O. B. Marvin, Secy.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Secy, Sistersville, W. Va.

June 14-15.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League of Indiana, on the grounds of the Limited Gun Club.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Bluerocks thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the 500 Gun Club. Three sets of traps. W. F. Duncan, Treas.

July 19-21.—Palmyra, Mo.—Eighth annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Secy.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail in all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

There was quite an excitement down at Rockaway Park, L. I., last week. The Cuckoos, as the members of the Rockaway Point Rod and Gun Club are called, were, of course, right in it. Two detectives and a coroner suddenly appeared at the Cuckoos' club house, carefully surrounding it and shutting off all means of egress, thus capturing all the club members, most successfully. The "prisoners" were informed that they must consider themselves under arrest until the mystery of the human foot, reported to have been seen on the club house ash-heap, had been cleared away. The foot was supposed to be a valuable clew to the identity of the man whose trunk and portion of one leg had been found recently floating in the East River. Luckily for the captive Cuckoos, the mystery was soon cleared up; the human foot turned out to be an old bear's paw, an ancient heirloom of the Cuckoos that had long outlived any usefulness or any significance that its presence at Rockaway Park might have had. Joe Bourke, the future citizen of the Klondike region, who was one of the captured ones, quickly regained his cheerfulness, and informed the coroner that, though every good and loyal Cuckoo was rated A1 at pulling anybody's leg, as a rule they covered their tracks most craftily, while the victims themselves, for their own peace of mind, were very seldom heard from.

On the evening of Jan. 28 the Guelph Trap and Game Club, of Guelph, Can., held their annual meeting for general business and election of officers for the ensuing year. There was a fair attendance of members. The treasurer's report showed the club to be in a flourishing condition financially. It was arranged that on Good Friday the Hon. President and President should choose sides and shoot a pigeon match, losers to pay for the suppers. The following is a list of officers chosen: Hon. President, His Honor Judge Chadwick; President, H. H. Cull, Sr.; Vice-Presidents, C. Quinn, R. S. Cull; Treasurer, L. Singular; Secretary, G. Porteous; Executive Committee: C. Quinn, W. G. Mitchell, J. Thatcher; Auditors: Geo. Richardson, A. G. Cull, Captain, A. G. Cull.

The Chicago Inter-Ocean has this to say of the great forthcoming event in the trap world: "Local trap-shooters are taking a great deal of interest in the Grand American Handicap, which will be decided at Elkwood, N. J., March 22 to 25. It is expected that upward of 200 entries will be made from the different parts of the country. The winner of the first prize will receive a purse of \$1,200 and the championship trophy. This is the largest amount of money ever offered for an affair of this kind. The team which will leave from Chicago about March 19 will be known as the Western team, and will comprise shooters from points in Illinois outside of the city, and from Wisconsin, Iowa, Indiana, Michigan, Minnesota, Nebraska and Utah. If the Western team makes a good showing in the tourney, an effort will be made to have the big handicap shoot held in this city next year."

Paul Litzke writes us that: "On Jan. 31, at Joplin, Mo., W. G. Sergeant and W. W. McIlhany shot a match for the medal representing the championship of southeastern Kansas and southwestern Missouri. The conditions were 50 targets, unknown angles. This resulted in a win for Sergeant by 46 to 42. McIlhany challenged him again, and this match was shot on Feb. 7. On this occasion McIlhany won, the score being 44 to 41. Sergeant was not satisfied with this, and in turn challenged McIlhany, and further requested that the match take place at once, as he intended to start for Hot Springs soon. McIlhany immediately shot him another race, winning by a somewhat improved score, 46 to Sergeant's 43."

Mr. John L. Lequin, Secretary-Treasurer of the Interstate Association, under date of Feb. 11 writes us as follows: "Mr. Edward Banks advises me that he has resigned his position as trap editor of the FOREST AND STREAM to take the secretaryship of the American E. C. & Schultze Powder Co., Limited, and he asks that he be released from membership of the handicapping committee for the Grand American Handicap of 1898. This Association has accepted his resignation, under the circumstances, and we hasten to advise you so, that you may make it public through your paper."

The amateur championship commences on Tuesday, Feb. 22, and will last two days. As already announced, the conditions are 100 birds per man, \$100 entrance. The event this year will be brought off on the grounds of the Carteret Club, at Garden City, L. I. It is hardly necessary to add that George S. McAlpin is the favorite; but such was the case last year, yet he suffered a comparatively easy defeat at the hands of R. A. Welch, of Philadelphia, who won with a score of 92, a great total under the conditions.

On Feb. 11 the Hazelwood Gun Club, of Pittsburg, held a meeting and elected officers as follows: President, John N. Crossland; First Vice-President, John G. Messner; Second Vice-President, T. C. Munson; Secretary-Treasurer, John McNeil; Captain and Manager, J. N. Crossland; Shooting Committee, J. G. Wyman, J. O'H. Denny, T. C. Munson, J. G. Messner and John McNeil. The club expects to have its new ground in order for the monthly shoot, Feb. 17.

Rolla Heikes and Charley Budd settle their little trouble about the Stove-Lid and its ownership next Tuesday, Feb. 22. The scene of the struggle will be the same as in the Grimm-Heikes match on Jan. 1 of the present year, viz., Dayton, O., the home of the bald eagle of the Ohio Valley. Quite a lot of the boys who have been attending the Hot Springs shoot will stop off at Dayton on their way home and witness the discussion.

This is the week of the Hot Springs shoot, and from present indications it looks as though there was going to be a good attendance at the Arkansas health resort.

O. R. Dickey, of Boston, Mass., says that he is getting in shape for the Grand American Handicap, and is going to do his best to duplicate his victory of 1896. He needs a mate to the c he won that year, as it looks kind of lonesome.

At Lebanon, N. J., on March 3, Louis Hildebrandt will give a live-bird shoot, birds 15 cents apiece, open sweeps, \$5 entrance.

In the Far West.

In the far West, on ground where once the buffalo and antelope ranged, the sportsmen of to-day set out target traps. At E

It seems that Mr. George Work, of New York city, well known among the club shooters of that metropolis, is sojourning at Phoenix, Ariz. He is matched to shoot a pigeon race, 100 birds, \$250, with Joe Holmes, of Phoenix, and at last accounts the local men did not think the visitor sure of winning.

Club Election

1206 BOYCE BUILDING, Chicago, Ill.

No one barred, no handicap; open to the world; commencing at 9:30 A. M. Lunch served on the grounds. There will be three moneys in events of 15 entries or under and four moneys in events of over 15 entries.

During the past week quite a few birds have been trapped in practice events.

The warm and moist atmosphere has been the means of taking away the greater part of the snow, and leaves the grounds in better condition to shoot over, though somewhat wet.

During the early part of last year the Garfield Gun Club, of Chicago, issued a challenge to shoot any club of Cook county a series of six team races, three to be at targets and three at live birds, the teams to be of ten men each. The target contests were shot during last summer, two of which were won by the Eureka Club. The first of the live-bird contests was held to-day on the grounds of Watson's Park, Burnside Crossing, Ill., and was largely attended by members of each club, as well as by many of their friends. Considerable interest was manifested by those in attendance during the entire day. The birds were a good lot and in two instances only was it necessary to use the flush rope. The wind was a left-quartering incoming, though so light as not to prove troublesome. The sky was overcast part of the time and the light was fair. Honors for highest scores were divided between Dr. G. Shaw and Ed Steck, who killed out straight. Many good kills were made during the match, of fast tailers and quartering birds, and those who witnessed the race showed their enthusiasm by their applause.

Following are detailed scores of the team race, of 10 men per team, 10 birds per man, the losing team to pay for the birds. American Association rules governed:

Garfield Gun Club.			Eureka Gun Club.		
S Palmer.....	0222201202	7	Hoyt	0*12202122	7
Dr Shaw	2122222222	10	L Goodrich	0022020222	8
A C Paterson	22212*2222	9	W Stannard	2200121022	7
J Graham.....	2202020200	5	Dr Frothingham.....	22122021*2	8
R Kuss.....	0122210202	7	F Lord	1210222020	7
A W Fehrmann.....	1012222*22	8	Dr Miller	000002*212	4
H Tefft.....	2222012020	7	F P Stannard.....	2220222020	7
E S Graham.....	*22222022	8	G Airey	22020*222	7
T P Hicks.....	0220112222	8	E Bingham.....	0012222222	7
Von Lengerke.....	2222222*2	9-78	E Steck	2222222222	10-7

Following the termination of the team event was a 7-bird sweep with \$3 entrance:

Bingham	2222112-7	Dr Miller	1222212-
S Palmer	2222221-7	E S Rice	0000212-
F Lord	0202211-5	L Goodrich	0202022-
E Steck	1022212-6	R Kuss	2022222-
Darlington	2102222-6	P Hicks	0212111-
I Glover	2122220-6		

Miss-and-out, \$1 entrance, birds included, each killing 5 straight the money was shot up.

It is quite probable that the second team contest between the Eureka and Garfield clubs will be shot at Watson's Park next Saturday, Feb. 19, as on that day the Eureka Club holds its regular monthly contest.

Eureka Gun Club.

The Eureka Gun Club, of Chicago, will hold its annual meeting and banquet at the Lealand Hotel, of this city, on the evening of Feb. 22, at which the officers for the ensuing year will be elected.

Pipestone Gun Club.

PIPESTONE, Minn., Feb. 6.—Subjoined is the score of the Pipestone Gun Club, at the club's shoot to-day. The conditions were unknown angles:

C	Briggs	1101111110010111100111111111
C	Cass	1101101011111110101100111110

Sistersville Rod and Gun Club.

SISTERSVILLE, W. Va., Feb. 12.—The following scores were made on the local club grounds Thursday afternoon, the little informants shoot being in honor of our guest, Mr. John F. Mallory, of Sistersville, one of the vice-presidents of the State Sportsmen's Association:

```
Dade .....111111110111111111111111111111111111—
J F Mallory...111111110111100111111111111111111100111111011—
A D McVey....0111111111111111001110111111110111111111101010
```

We regret exceedingly to be compelled to announce that the Sistersville Rod and Gun Club, as well as the sportsmen in general of West Virginia, are soon to lose two of their very best members, who are to leave here Monday next for the far-away Klondike gold fields. We refer to Messrs. Dan M. Wallace, who has been president of the local gun club since its organization two years ago, also vice-president of the West Virginia State Sportsmen's Association, and Lou M. Gorham (Scout). The two gentlemen—and thorough gentlemen they are—have a wide acquaintance among the representative trap and field shooters of the country, all of whom I am sure will deeply regret to hear of their departure. Both Mr. Wallace and Gorham have been quite successful in the oil business, and we are sure that every reader of this will join us heartily in wishing them even greater success in their search for the yellow metal and their fortunes at the Klondike.

ED O. BOWSER

Philadelphia Trap-Shooters' League.

PHILADELPHIA, Pa., Feb. 5.—The tenth monthly shoot and tournament of the Philadelphia Trap-Shooters' League was held to-day on the grounds of the Glen Willow Club, near Cinnaminson Station, north of Manayunk. There were eleven clubs represented by a total of sixty-five shooters.

The scores were not quite up to the usual form, owing most probably to the weather conditions. A series of sweepstake events were held in the morning. In these events Mink, Anderson, Haupt, Park, Torpey, Yost, U. M. C., Jr., Daly, Blundin, Keller, Redifer, Jenkins, Ross and Daly figured at the top of the list nearly every time.

Among those present from a distance were: Mrs. M. F. Lindsley (Wanda), of the King Powder Company, of Cincinnati, O., who took part in a few of the sweeps shot during the day. Accompanying Mrs. Lindsley was T. H. Keller, who represents the interests of the King Powder Company and Peters Cartridge Company in this part of the States. Another visitor was John J. Hollowell, known as U. M. C., Jr., owing to his connection with the U. M. C. Company, of Bridgeport, Conn.

The main event on the programme at these monthly shoots is always the team race, which is a handicap affair; the weaker clubs being allowed extra targets to shoot at. To-day's contest was won by the Southwark Club with 145 out of 203; the Silver Lake Gun Club and the Roxborough Gun Club tied for second place with 142 each out of 175 and 189 respectively. Below are the scores in this race, the figures after the club's name denoting the number shot at:

Florist Gun Club, 165—Burton 21, Hollowell 24, Cartledge 21, W. H. W. 26, Parks 17, Anderson 22—131.
Silver Lake Gun Club, 175—Hahn 22, Shannon 24, Winchester 24, Woodsteger 25, Fisher 24, Ford 23—142.

Trap Around Pittsburg.

Hazelwood Gun Club.

PITTSBURG, Pa., Feb. 4.—The Hazelwood Gun Club held its meeting this afternoon and elected the following list of officers to serve for the ensuing year: President, John N. Crossland; First Vice-President, John G. Messner; Second Vice-President, T. C. Munson; Secretary and Treasurer, John McNeil; Captain and Manager, John N. Crossland; Shooting Committee: J. G. Wyman, J. G. Messner, James O'H. Denny, T. C. Munson, John McNeil; Directors: Dr. E. J. Stille, Frank Hughes, Frank Cunningham, Frank Wilbert, J. G. Wyman, J. O'H. Denny, J. G. Messner, John McNeil.

After the meeting a number of the members indulged in a practice shoot, which was won by President Crossland. The start-off was a 50-bird race between Crossland and Munson, but three others got in after the first 25 birds had been shot at, and the scores made were as follows:

Munson.....	2102111022022120222122220—20
Crossland.....	0122220221212210122121202—21—41

History of the Grand Hotel Cup.

INDIANAPOLIS, Ind., Feb. 5.—This handsome and valuable trophy was presented to the Limited Gun Club, of Indianapolis, just previous to its first annual interstate amateur autumn tournament, which occurred in September, 1895, by the Hon. Thomas Taggart, Mayor of the city of Indianapolis, proprietor of the Grand Hotel, and a member of the Limited Gun Club. It thus became the personal property of the Limited Gun Club, and that organization will dictate the conditions under which contests for its temporary possession may occur.

Immediately upon receipt of Mayor Taggart's beautiful gift, the club decided to offer it for competition in the autumn tournament. It was made emblematic of the amateur championship at targets of the five States—Ohio, Kentucky, Michigan, Illinois and Indiana—and was contested for in a sweepstake at 50 targets, unknown angles. Mr. Harry Lyons, of Louisville, Ky., and Mr. George Elliott, of Rochester, Ind., tied with 49 each. Mr. Lyons won the shoot-off.

The cup was returned for the second interstate amateur autumn tournament, and was again placed in a sweepstake at 50 targets, unknown angles. Mr. O. V. Ebelsor, of New Albany, Ind., and Royal Robinson, of Indianapolis, tied with 46 each. Mr. Ebelsor won the shoot-off.

It was returned for the third interstate amateur autumn tournament, and was contested for at 100 targets, unknown angles, entrance price of targets, but it was also left open to challenge to add to its interest and value. It was won by Mr. W. M. Thompson, of La Fayette, Ind., with a score of 91.

Mr. E. H. Tripp, of Indianapolis, challenged Mr. Thompson. The match was shot at Crawfordsville, Ind., and resulted in a victory for Mr. Tripp. Score, 86 to 84. Mr. George C. Beck, of Indianapolis, challenged Mr. Tripp, and won from him at Indianapolis by a score of 86 to 77. Mr. John Cooper, of Indianapolis, challenged Mr. Beck, but Mr. Beck held the trophy by a score of 84 to 82.

Mr. Fred Erb, of La Fayette, Ind., has challenged Mr. Beck, who has named Feb. 22, at Indianapolis, as the time and place for the match.

The Conditions

governing the contest for the temporary possession of the Grand Hotel cup for the year 1897-1898 are as follows:

Any amateur residing in either of the five States, Ohio, Kentucky, Illinois, Michigan and Indiana may challenge for the cup by sending \$10 forfeit to the Limited Gun Club, Indianapolis. If the directors of the club consider the challenger eligible they will immediately notify the holder, who will accept within ten days of the receipt of the challenge, forward \$10 to the secretary, and name a date and place for the match within thirty days of his acceptance of said challenge. Should the decision be against the challenger his money will be promptly returned.

On the day of the match each party will put up an additional \$10, the winner to take the trophy and the stake. The match will be shot at 100 targets per man, unknown angles. In case of a tie the contestants will shoot at 25 targets each, unknown angles, and continue until the match is decided. The cost of the targets can be arranged by the contestants. Should the holder fail in any of the above conditions the cup is forfeited to the challenger. The winner will be required to furnish a satisfactory bond for the safe return of the cup to the Limited Gun Club for challenge competition and for the annual interstate autumn tournament. No challenge will be considered after the holder has been notified to return the cup for the annual tournament.

LIMITED GUN CLUB.

Missouri's State Shoot is Wide Open.

KANSAS CITY, Mo., Feb. 4.—In firing this my first gun on paper I have a two-fold object in view. First, to insure the class most interested, viz., the professional, or paid shooters (manufacturers' agents, etc.), that a hearty welcome awaits them all from every section of America at the annual tournament of the Missouri State Fish and Game Protective Association, to be held May 16-21, in this city. All events, except those of purely local and State interest, such as individual championships at live birds and targets, State club shoots, etc., will be open to the world, the management, however, reserving the right to exclude any shooter who, for any cause, fails to measure up to the "noble standard."

My second reason for trespassing upon your valuable time and space is to give my idea of the paid shooter at our annual tournaments.

If I were in the sporting goods business I certainly would bar all professional shooters, for the following reason: Everything in the line of guns, ammunition, shooting costumes, etc., is furnished by the manufacturers, hence he is a poor customer of the retail sporting goods merchant. If I were only an ordinary shot I would keep Mr. Good Shot away from all tournaments, in order that I might be able to earn a second-class gun or some article of merchandise hardly worth the freight or express charges home. The amateur base ball team has for its audience the rabble, whose enthusiasm reaches out to the limit of the precinct of the ward in which the lot is situated, and on which they play ball. The same can be said of foot ball and other classes of athletic sports. Except in isolated cases it's the "way-upper" that we spend our money to see, that draws the crowds. Amateur theatricals live only for a night, and then only in the midst of its friends.

My experience in the game has covered a period of only four years, but in my estimation the best four years of trap-shooting life. I have attended a number of so-called amateur tournaments. They are a success for a day, when "my friend from the brush" goes back to his home and lives in seclusion until the next tournament adjacent to his county takes place, when by dint of much denial he has saved up \$6 to shoot another day. But give me the tournament where the bars are thrown down, and where no little two-by-four shooters need apply; where an intelligent and equitable handicap prevails; where all the "daddies of them all" meet, and have to shoot some to stay in the game. The kind of a tournament I mean is the kind that the Missouri State Fish and Game Protective Association has had for the past two years. In May of this year a bigger and better one than ever will be held. I of course expect to be jumped on by a great many people who do not agree with me, but I have something up my sleeve left for all such. The definition of amateur has been given to the vast army of your readers a number of times. I have my own peculiar construction, which can be readily understood by a perusal of the above.

In conclusion, we extend an invitation to our Eastern friends, and particularly to our Chicago brethren, to be present at the greatest tournament of the year.

G. M. WALDEN,
Pres. M. S. F. and G. P. A.

Smokeless Powders at Low Temperatures.

NEW HAVEN, Conn., Feb. 11.—*Editor Forest and Stream:* In view of the items which are appearing in Western papers as to the failures of smokeless powders to explode at low temperatures, we write to say that we yesterday exposed U. S. 30 Government cartridges of our make, loaded with Du Pont's powder, for one hour to a freezing mixture of carbonic acid, snow and ether. This mixture gave calculated temperature of about 100 degrees below zero, Fahrenheit. The cartridges so exposed were taken from the mixture and immediately fired, with the result that they gave prompt fire in every instance. Velocities were reduced about 100ft.

We would say further that the ordinary test of the Ordnance Department includes the firing of smokeless powders at 40 degrees below zero, and that the powders will easily stand such an inspection.

We believe this report has been made by some one whose gun was clogged by freezing oil, so that the hammer failed to deliver its full blow, or the firing pin had lost its free action.

We hope you will publish the above information, which you can feel sure is correct.

WINCHESTER REPEATING ARMS CO.

John F. Weiler Gun Club.

ALLENTOWN, Pa., Feb. 9.—The scores made at the John F. Weiler Gun Club's shoot to-day are as follows:

Medal shoot, 25 targets per man:	001110111111111111111111—21
M Brey.....	001010001111111111111111—15
O Acker.....	100111111111111111111111—16
C Kramlich.....	011111111111111111111111—22

Match, 15 live birds per man, \$25 a side, Hurlingham rules: W. L. Gillette 12, J. F. Weiler 13.

Sweepstake, 10 live birds: J. F. Weiler 9, M. Brey 8, O. Acker 8, Flickenger 8, Big Hufford 7, C. Kramlich 8, E. Ulmer 7.

Individual match: Gossner 10, Griesemer 9.

C. F. KRAMLICH, Fin. Sec'y.

Lincoln Gun Club.

LINCOLN, Neb., Feb. 7.—A very interesting shoot of our club occurred on Feb. 4. We think it very interesting, as our vice-president, Geo. B. Simpkins, and our secretary, Geo. L. Carter, tried to see who was the best man. The day was a very disagreeable one. A strong wind blew across the traps, making good scores impossible.

The match for \$25 a side was won by Mr. Carter in both the contest for targets and live birds. Those who engaged in the shooting say they never had a more disagreeable day. This accounts for the scores being below the usual average of Lincoln sportsmen.

The score of the 50-target event was as follows:
Simpkins1001110101010010000011010101111001111—27
Carter11110101010111101111111111111111111111111111—40

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, FEBRUARY 26, 1898.

VOL. L.—No. 9.
No. 840 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

THE CHANGING WAYS OF GAME.

FACTS in support of the principle that the fittest must survive have never been wanting since the great naturalist announced it. We all recognize that the strongest, the most cunning, the swiftest and the most wary of any species are the ones most likely to procure food or to escape from their enemies, and so to survive and to transmit to their offspring those qualities which have prolonged their lives. Like many other great truths, the principle is so simple that we may well wonder that the world waited so long for its announcement and its demonstration. Even the most unlettered hunter or gunner accumulates facts which bear on it, and though he may never have heard of Darwin or Wallace, will relate to you matters which might well enough have found a place in their writings.

The fitness which gives advantage to any creature is, of course, mental as well as physical. That experience teaches is just as true of wild creatures as it is of men. Alexander Selkirk, whose adventures gave us the boy's great classic, told of the dreadful tameness of the birds which he found on the desert island where he was cast away, and the early voyagers in unknown seas relate the same tale of tameness in birds, seals and other animals when these first saw man. To-day there is no animal on this continent more cunning than the much-hunted deer that lives in a settled country. But twenty years ago there were many places in the farther West, seldom or never visited by the white men, where the deer would long stand and stare at the hunter, at least falling an easy prey to his rifle. No animal in this country is shyer or more wary than the mountain sheep of to-day, yet fifty years ago it was considered, except the buffalo, the easiest animal to kill on all the plains. Even the stupid buffalo, in the few scared individuals that last survived on the northern plains, learned at length the terrible lesson of experience and became as wild as an antelope. A speck upon a distant hill was enough to start them in flight; a horseman miles away made them frantic with terror and drove them to the most remote and rugged fastnesses of the waterless Bad Lands. This wildness and its resultant flight reacted on the physical characters of the buffalo there, and led to changes in its aspect to which we long ago called attention.

The lesson of experience which these animals learn about man is not merely that he is a dangerous creature, and one to be avoided. They are as readily taught the opposite, and under certain circumstances become as tame and as confident in his presence as under other conditions they become wild and fearful. With equal readiness they learn lessons of danger and of safety. Nowhere is this shown better than in the Yellowstone National Park, where, under absolute protection, elk, deer, mountain sheep and even bears—wildest and wariest of all our game—have learned that there man is for them no more dangerous than any other animal. A few years ago if any one had predicted that the time would come in the Yellowstone Park when the bears would make a practice of coming up to the hotels to be fed, he would have been laughed at for a lunatic. Yet at the present time this is seen daily during the season by crowds of astonished tourists. In the Gardiner cañon mountain sheep in winter are daily seen feeding and resting within a few yards of the wagon road, along which pass the loaded teams going to and from the post. Many other examples might be cited of the way in which contact with civilized man modifies the habits of our larger animals.

Coming down to our times and to matters which are within the range of experience of large numbers of older sportsmen, mention is to be made of the change in habit of the quail, or Virginia partridge. It is not so many years since the habits of these birds were pretty well

fixed. In the autumn, after they had settled down to their winter feeding ground, it was usually not difficult to find them. The gunner familiar with the ground could usually locate them without much loss of time. Nowadays this is no longer true. In districts where they are much hunted the birds seem to have learned that there is no safety for them on the stubbles. They appear to venture out from the swamps to feed only for a little while in the morning and at night, and then take the wing, flying—whether to the swamps again or in some other direction—so that a dog cannot follow them, and the finding them becomes a matter of pure accident. If by chance approached while on the stubble they rise wild at the sight of dog or man; the sound of a distant gun puts them all on the wing. Manifestly birds possessing such caution are likely to survive.

It is well known that on Long Island, in Connecticut and in other places where quail have for many years been persistently shot, they often alight in trees instead of on the ground, thus escaping the danger of being scented by the dog. This habit appears to be growing much more general with the birds in the sections mentioned, and is being taken up in parts of the South where we are told it was formerly very rare. It is obviously a very great protection. It has been observed also, as a matter of common occurrence at field trials in the South, that when a bevy of quail was flushed wild in the open, another bevy within hearing would also flush and go to cover, presumably concluding that the danger which caused their fellows to seek safety was sufficiently serious to prompt them to do the same.

It has also been noted that birds do not lie to the dogs's points so well as formerly, but show a disposition to run, and to run fast and far. In Mississippi, in a region where the birds have been frequently disturbed, it has been observed that after a bevy had been flushed and followed into cover, the birds, though they flew together, would when they came to the ground run singly in every direction, thus breaking up their identity as a flock, and of course making the work of finding them much more difficult. In some parts of the South most of the birds keep in the woods or close to them all the time.

In recent years the habits of the pinnated grouse on the Western prairies have undergone marked changes. This species was formerly distinctively a bird of the open, but of late years it shows, when alarmed, more and more a disposition to seek cover—by which we mean underbrush and timber. The young prairie chickens, once most unsuspicious and gentle birds, have become wilder and far better able to take care of themselves than in the past. Nowadays the birds not only show a disposition to take to cover when alarmed, but to pass much of their time in or close to it, thus suggesting the habit of the Eastern heath hen, which is a bird of the woods and not of the open ground.

The ways of wildfowl in localities where they are constantly gunned have undergone changes in the same direction. Where once they flew low they now fly high; where formerly they decoyed readily they now often avoid decoys, except in weather which is such as to obscure the character of the lures. In some places where point shooting used to be practiced with great success it has now become almost obsolete. The more the fowl are gunned the wilder and less accessible they become. In certain territories where the numbers of birds are still very great the annual destruction grows yearly less, notwithstanding the great increase in the number of gunners.

Not only do these wild animals learn by experience and thus manage to escape the dangers with which their lives are beset by man's pursuit, but it cannot be doubted that the offspring of to-day have inherited from their parents a cunning and wariness which the individuals of years ago did not know. It is a well-recognized fact that the young of bears, wolves and deer, even if they have had no experience of man, are at present nearly as difficult to capture as the old ones. In other words, they have either been taught wisdom by their parents or have inherited it. Probably both elements have contributed to their education.

All these facts, and many others which might be gathered, tend to show that man in his destruction of these wild creatures is not forever to have matters all his own way. In the constantly increasing cunning of deer

and quail which in small numbers are still enabled to survive, even where continually hunted, we have hints of a time when the inherited intelligence of the game will in a measure—if not in large measure—compensate for the universal diffusion of rapid-firing arms of precision, and for the increasing numbers of the hunters.

THE LIBERTY OF THE FIELDS.

SHOOTING conditions in this country are changing in no respect more rapidly than with those which govern the privilege of entering upon fields for shooting and fishing. In the old days—and they were not so long ago, either—the gunner who sought shooting privileges was, for the most part, a resident of the vicinity, known by sight at least to the proprietor of the land, his neighbor in fact; and the same neighborly feelings prevailed here as in other affairs. To go at will upon a farm and into woodlots for birds or squirrels was a matter of course. No one ever expected to ask for any special permission to do this, nor to have it asked. There were even then posted lands, but these were the exception and not the rule. The notion of forbidding free entry upon one's field was not by any means commonly held nor commonly sympathized with. The land owner who treated shooters as intruders and trespassers was himself quite likely to be looked upon as a bit cranky; and when some one got the better of him the community took it good-naturedly and appreciated the humor of the situation.

Moreover, the same neighborly feeling which opened fields and meadows and woodlands freely to shooters and fishermen governed those to whom the privileges were extended. Thoughtless boys who tore down stone walls for woodchucks or rabbits might not stop to repair the damage done, but the elders were as regardful of the property of their neighbors as of their own, and the proprietor whose lands were hunted over had no reason to interpret the booming of guns in his fields as so many signals that his property was being destroyed, fences torn down, stone walls demolished and horses and cattle disturbed. He knew that the sportsmen were neighbors, and that they were to be trusted. In their excursion upon his lands he found no cause of alarm, no more than they themselves would have when he returned the compliment and went armed and equipped upon their fields.

In some happy lands the old conditions still prevail; but in very many sections a decided change of sentiment and of practice has been wrought. It was inevitable that this should be so. The hosts of shooters have been multiplied by tens and hundreds. They constitute in season, and sometimes out of season, an army of invasion. They are no longer one's neighbors nor the sons of neighbors. They come from distant towns and cities and States. The railroads unload them upon the community for all the world like bodies of troops for war. The booming of guns, instead of being an incident of autumn days, is continuous for weeks and months, not omitting Sundays. And when the farmer hears the reports he may no longer say to himself, as formerly: "That is Tom Smith's gun. I hope he'll drop in and see us on the way home." For it is not a neighbor who is shooting, nor any one with a neighbor's claim to the privilege of shooting without permission; it may be an entire stranger, devoid of the courtesy which should prompt to a polite request for permission to shoot, and one who, having invaded the fields without so much as "by your leave," assumes to have a natural right to be there, and resents any interference or protest from the proprietor as a manifestation of "popocracy."

Most questions have two sides. This one of shooting privileges and trespass laws will never be settled by denouncing the farmer as unreasonable when he seeks by statute to control his own lands and to forbid or permit entrance upon them for shooting. If the land owners in any given district are actually unreasonable in their demands, investigation probably will show that their patience has been exhausted by the impositions put upon them by unreasonable gunners; and there are as yet, we believe, few game districts where the sportsman who treats others as he would himself be treated if in their place may not find in that considerate regard for others an open sesame to hospitality and good shooting. The game interests of the country have nothing to fear from rigorous trespass laws.

The Sportsman Tourist.

A Turtle Chase.

ONE of the most interesting hunting experiences I ever enjoyed was a turtle chase in the Indian Ocean. It is true that I did not take a very active part in it, was spectator rather than hunter, but nevertheless the experience was a most enjoyable one.

I had met a friend of mine at Calicut, where his steam yacht was then lying, undergoing some light repairs. He asked me to go turtle hunting with him, and I gladly accepted the invitation. Next day we started, and after steaming a couple of hundred miles, the yacht pulled up off a straggling group of coral islands.

It was too late to do anything that day, but early next morning we hoisted the native boat over the side and got aboard. It was rather an odd-shaped craft, with a deck fore part and a high-peaked nose like a gondola. My friend and I sat in the stern. Kutti Ali, the native turtle hunter, perched himself on the decked bow, and the men bent to their oars to carry us in among the islands.

It was a perfect day, and the sea was as clear as crystal. I never saw such limpid water. There wasn't a ripple, and we could see the bottom at eight or nine fathoms as though we were looking through a sheet of clean glass. We seemed almost to be floating on air. Underneath us lay all sorts of colored sea shrubs, interspersed with horns and hollows of coral, and among these darted thousands of bright little fishes of almost every conceivable hue.

Gazing down at the bottom, I noticed a long, lazy-looking creature whose jet blackness contrasted strangely with the gaudy colors all around it. My friend informed me that this was the sea slug from which was derived that extensive article of commerce which the Chinese are so fond of using in their soups, *beche de mer*. If you touched this creature, he said, it would exude a liquor which would stain your fingers a dark red.

Having satisfied our curiosity gazing down into the depths, we brought our attention back to the matter in hand. Kutti Ali, the spare and sinewy native, was standing on the bow, with his hand shading his eyes, looking to the right and left for game. Presently he seemed to catch sight of a quarry. He began to make active preparations for the chase. He first gave orders to the boatmen to pull in the direction he desired, and while they were doing so he stripped off everything save his loin cloth, and stood ready for the fray.

For our part, we looked earnestly in the direction in which the boat was heading, but could discern nothing. The water on which we were now gliding was about 12ft. deep, and the bottom was mostly of fine white sand, with here and there a clump of shrubs and coral.

It appears that Kutti Ali, from his vantage point on the bow, had seen a dark shadow pass from one to another of these clumps, which he believed to be a turtle. As we approached its hiding place, Kutti Ali kept his keen eye fixed upon it, so that the quarry should not elude him. Presently he motioned the oarsmen to cease rowing, and we all peered down over the side. We could observe nothing at first, but while we were still looking all of a sudden a big, dark creature darted out of the shadow of the clump and sped away for the shelter of another. That turtle was no fool! Instead of scooting off in the direction our boat was pointed, he rounded on us, and so gained considerable time. Kutti Ali fished up a long bamboo pole and helped to get the boat around, keeping at the same time a sharp eye on the clump where our chase had taken refuge. The water was so limpid and still we could see the spot quite plainly. Once more we were on the turtle's track. This time, however, he did not wait for us to come up, but scooted away at full speed for the deeper water, toward a large patch of rocks and sea shrubbery, which promised him greater safety from his pursuers.

It was now a race for life. If our quarry gained that patch, he would escape us to a certainty, and he had 50yds. start. Kutti Ali turned to the rowers and urged them to increase their speed. They caught his enthusiasm and pulled like sons of guns.

On, on we dashed after that turtle, gaining on him inch by inch and foot by foot, but it was exceedingly doubtful if we should be able to reach him in time. Kutti Ali seemed to fear this, and capered about on his little deck, gesticulating like a madman.

"Valli! valli! oraka valli, kuttigale!" (Pull! pull! pull strong, O my children!) and six pairs of lusty arms made the boat fairly fly through the water.

The turtle was now only about 100yds. from the big clump, and we were still some 20yds. behind. The chase looked to us almost hopeless, but not so to Kutti Ali. He knew several tricks in turtle hunting that we weren't at all up to. Suddenly we saw him raise his bamboo pole and bring the end of it down with a resounding whack on the deck. As soon as this noise reached the turtle he made a spurt forward, but soon fell back to his former speed. Again came the thump of the bamboo, and again the foolish and frightened quarry spouted. This was repeated a third time, and as each spurt had tended to exhaust the stock of air in the creature's windbag, there was nothing for him to do but to rise to the surface and replenish. Up he came, and in such a mighty hurry that he sprang almost entirely out of the water, his head and neck outstretched to take breath; and then down he went again. But this had taken up some of his precious time, and we were now close upon him.

Presently he seemed to grow "rattled." Instead of keeping straight on toward his mark, by doing which he might possibly have reached safe shelter, he sheered off from his course, and so gave us a better chance to capture him.

On he went past the big clump, leaving it 8 or 10yds. to one side. Having got his chase out into the open, Kutti Ali contented himself with racing along overhead and a few yards behind. Before making any further move, he evidently meant to tire the creature out.

Now, what do you suppose that turtle did? Having

drawn us past the clump, he suddenly rounded on us again and scooted back toward it at full speed. He must have judged that he would gain on us that way, and perhaps reach safety after all. If ever a boat came round quickly, it was ours, and we were after our tricky game before he had gained half a dozen yards.

Kutti Ali's mad was up, and it was evident that he wasn't going to be fooled by a lumping old turtle any longer. We saw him get ready to dive, and when the boat came up again and her nose was almost over the turtle's back, Kutti Ali made a spring into the air, twisted his body round so that he faced us, and went down feet foremost just about a yard ahead of his prey.

As our boat shot over the place where he had disappeared, all we could see as we looked down into the depths was a confused jumble of legs and feet and arms and flippers. Next moment we saw the turtle darting out to sea again. He had evaded the fatal grasp which Kutti Ali had tried to get on his flippers, and so escaped.

The sopping hunter came to the surface puffing and blowing, and we pulled him aboard and resumed the pursuit. Once more we gained upon him, for he was now beginning to grow very tired. Presently the native made his spring into the air a second time, twisted his body round as before, and disappeared in a volume of spray. The unfortunate turtle was not so nimble this time as he was before, and though he attempted the same dodge, his hind flipper did not escape the wary diver. We saw the same jumble of legs and arms and flippers, but while we could not witness the feat, Kutti Ali, with the hind flipper in his vise-like grip, reached forward with a quick motion and seized the fore flipper on the same side, and the jig was up. As the man and the turtle rose to the surface, another of the boatmen leaped over and assisted the breathless but exultant diver. With a sudden push upward on one side and downward on the other, the captured turtle was turned over on his back in the water, and after a few long, wheezy breaths through his horny beak and nostrils, and a few ineffectual struggles to regain his natural position, he yielded up the contest.

Our boat was tilted, and with a "heave, ho!" and considerable danger of a capsize, we got Mr. Turtle on board and took him to the yacht. On weighing him we found him to tip the scales at exactly 327lbs., and his shell measured 3ft. 7in. one way by 3ft. 3in. the other.

On the whole, what with the sunny loveliness of the day, the beauty of the scene and the novelty of the experience, this my first and only participation in a turtle chase was one of the most enjoyable incidents of my life.

G. H. W.

Ice Architecture and Winter Carnivals.

WINTER visitors to the hyperborean cities of St. Paul, Winnipeg, Montreal or Quebec, never fail to be enthused by the eclat of the local hyemal sports, which so often culminate in carnivals eclipsing in brilliancy and fervor the fetes of more southern climes. Hearthrug denizens of low latitudes, who are always wont to contemplate zero weather with a shiver, at once fall in love with an atmosphere and climate which yields to both sexes a measure of vigor and health-giving enjoyment such as they had never experienced before or contemplated. Romps on snowshoes, curling, coasting, toboggan whirled, sleigh rides, fantastic processions, ice palaces, and the rhythmic courses of the ice rink, they find, have taken the place in those cities of the enervating indoor pastimes which were once in vogue, and apparently everyone has been the gainer by it. Not to say that social interchanges of the drawing room and tea table are obsolete, but rather that their enjoyment is enhanced and enlarged by the ability and disposition to enjoy which are imbued into the whole system, moral as well as physical, by the potential agency of frost. Youngsters who sport on the streets and rinks are all as rosy as radishes and as tough as hickory nuts, jolly and self-poised, while the old and elderly declare that life is the more worth the living for the vigor which comes to them through the self-enforced duty of turning out betimes into the frigid air to view or participate in the saturnalia of the season. By Pallas! there are no such ruddy and happy damsels as those who tramp with the snowshoe clubs in witchery of fleecy capotes and gaudy tuques of blue and crimson. Instead of poling in for the winter like dull bruin they all exert themselves to make that frigid period hilarious and especially enjoyable. And the whole community profits in every way, for how can sensuality and villainy find place or flourish in healthy and rugged conditions? King Borealis interdicts it.

The universal eclat which has always attended the installation of ice palaces in these boreal cities, and the incomparable creations which have grown up in a night, as it were, like frost work on a window pane, have had the effect to excite a keen interest in the possibilities of ice architecture. Long strides indeed have been taken in this direction since the year when the empress of all the Russias erected her primitive structure on the river Neva. Nothing so fairylike and fantastic had ever been seen before then, and every fur-clad dweller under the arctic line contemplated with feelings akin to awe an edifice which was so solid as to resist the assault of armies, and yet so unsubstantial and evanescent withal as to melt like a dream. The Canadians, who built their first ice palace in 1883, were good imitators of the Neva model, though quite surpassing it in size and architectural design; but the Minnesota city of St. Paul later on was emulous of what Montreal had previously accomplished, and attempted more pretentious lines. The success which she achieved elicited the admiration of all who beheld the wondrous structure which she created. It was a subtle inspiration of genius. The Canadians had attempted only rectangular lines; the others adopted intricate geometrical figures and exquisite curves, with arabesques, which were produced without much additional labor or expense, so that her first inception far surpassed any one of the three Laurentian palaces which had preceded it.

But her second effort (in 1887) was more aspiring still. It was superlative. It was far more elaborate and twice as expensive, while the palaces of 1888 and 1889 were yet unique conceptions, and marvels even to the ambitious men of the Northwest, to whom colossal enterprises are not at all uncommon. Perhaps the palace of 1887 may be regarded as the climax of them all, not only in its tout ensemble, but in its details and boreal accessions. Its exterior dimensions were 200 by 220ft., with a superficial area of nearly an acre. Its principal tower rose to a height of 130ft. Imposing effects were obtained by an ingenious juxtaposition of angles and façades, towers, balconies and turrets, which would have astonished the medieval architects. And the interiors were quite as elaborate as the outside, being divided into many superb apartments, the chief of all being the grand hall of audience, which was a perfect circle roofed in diameter, decorated with ice statuary of heroic size. The throne room at the base of the huge "donjon keep" was an imposing octagon 50ft. across, while the throne itself was a wondrous work of art, massive, rich and chaste, vying with the marbles of Rome. Transcendent effects were produced by electric interior illuminations, which were truly weird, novel and enchanting. Penetrating the translucent walls, they suffused the whole fabric from summit to foundation in a manner more entrancing than moonlight on the lake, or the play of phosphorescent ripples on a South Sea island beach. It was glory en bloc, congealed!

For several subsequent years mild winters prevented repetition, thereby gaining a new character for Minnesota weather, which was supposed to be almost subarctic in its severity. But in 1895 the ice king resumed his sway, and a new structure of ice blocks arose. This time it was a fortress instead of a palace—a simple, rough-work fortification, with parapets 15ft. high, and bastions at the angles, and a central tower rising 30ft. Its area of space of 600 by 300ft. gave ample opportunity for Indian camps, interior games and pageants, and wider scope for the salient features of the winter carnival, which in itself has invariably proved a source of social, physical and pecuniary emolument, as immense crowds from abroad were attracted by the street illuminations and parades and the holiday license which was everywhere allowed.

During the same winter Leadville, Col., made a new departure, and instituted an ice palace in the castellated form which St. Paul had discarded, but circumstances of mood and weather have not prompted a reproduction of the like in any quarter, so that what is written here may pass for history instead of current description. The amounts spent on these ice structures has been considerable, but the investments have proved satisfactory, and it is a safe venture to predict that if the Klondike pans out liberally this year a structure will arise on the Upper Yukon which will shame the Eskimo and beat all previous records in ice architecture. The following are the dimensions of the principal ice palaces erected to date:

Date.	Place.	Length, feet.	Width, feet.	Height, feet.	Cost.
1883.....	Montreal.....	90	90	75	\$2,000
1884.....	Montreal.....	130	130	75	4,000
1885.....	Montreal.....	160	160	100	5,000
1886.....	St. Paul.....	180	160	106	10,000
1887.....	St. Paul.....	220	200	115	20,000
1888.....	St. Paul.....	200	200	132	20,000
1889.....	St. Paul.....	252	202	111	15,000

An Hour with the Gray Squirrel.

In southeastern Virginia, where—before the war—were vast well tended, rich plantations, is now to be found much waste land. Those owning large tracts can generally afford to cultivate but a portion of the land, and the remainder is allowed to lie idle to be overrun with field pine and scrub growth. The merchantable hard wood timber has been cut off of much of the land, but now and then a tract is found whose owner has refused to succumb to the blandishments of the sawmill man. Game of all kinds is plentiful in this section, from quail down to deer. Some men would reverse this classification, but my brother sportsmen will accept it. Quail are especially plentiful, owing to a prohibitory law against killing them in any season, now in its second year.

A walk through our stubble in September resulted in raising (we only flush in shooting season) three fine coveys of well-grown birds, to my regret, all peaceably disposed.

I am law-abiding, but would exercise the universal principle of self-defense, at any time, if attacked by Virginia quail.

While spending a few days in September on a plantation where the timber had been preserved, I went one morning to see if the squirrel was ready for his share of the season's sport.

If you find this gentleman in the hickories then he is game and edible. Slipping from the house at break of day—an ideal morning for hunting squirrels, perfectly still and warm—I crossed the barn lot, scaled a fence and was in the woods—a grand forest of oak, hickory, elm, poplar, gum and other trees, many towering to a height that made me wish for something heavier than the light 16-gauge weapon I carried; for, although a young squirrel is easily stopped in his rush for the den tree, by a well directed load of No. 6 chilled from a 5½lb. 16-gauge, an old fellow in tall timber with a coat that has had two or three winters' tanning will not even stop to scratch for so small a matter.

You need a 10-gauge and No. 55 for the old folks in the big trees, and then you will have to leave one up a tree now and then.

If you have a drop of sporting blood in your veins you will feel a sense of pure delight in being in the woods at daybreak, when all the bird, animal and insect life is awakening. You will thrill with gratitude and fervent content that is almost prayer.

Generally you will wonder at your imbecility in sleeping away such delight, as you have been doing morning after morning for years past, and determine that you will do so no more, but rise early and get into the woods often, if not every day.

This enthusiasm is well founded and real, but tran-

sient. The next morning when you again wake at day-break you will hastily snuggle down with another sense of "fervent content" that you don't have to go into the woods, but can sleep.

The woods does not wake to life like the fields; it is gentle and quiet in the woods at daybreak. Birds call softly, as though loath to disturb the profound stillness. The insect army seems but half awake and droning in whispers. The rollicking rowdy squirrel, who at the first bright ray of sunshine will be threshing down a shower of nuts from the top of a hickory, or barking shrill defiance at a rival a quarter of a mile distant, will be as quiet as the proverbial mouse when he steals through the woods at early dawn. Turn out the first bright morning you wake early and get into the nearest woods for a personal test of this pleasure; you will then see how much the reality exceeds the word picture, even when drawn by an enthusiast.

In plenty of time I made my way down among the tall hickories, where the first stand was to be made, for it was to be a "still-hunt," as the natives call hunting without a dog.

The first faint sounds of woods life were beginning to be heard, and there was what woodsmen call the smell of day in the air.

The trees were dark and spectral low down, but getting quite distinct higher up against the sky.

In a few moments I heard the "swish" of a limb that

for the telltale fall of a nut or "swish" of a limb, apparently coming from a tall hickory about 50 yds. ahead.

Working up cautiously, I took a position that gave me a clear view, and found that I had treed.

A shower of chips was falling through the lower limbs of the tree, showing that at least one hungry fellow was hard at work high up in the hickory shelling a breakfast. When a hungry, unsuspecting squirrel is breakfasting in a nut tree that has thick leaves on it, you never know how many are there. One will make such a fuss and keep the air so full of chips you are ready to believe that you have half a dozen treed.

Growing near the hickory was a poplar tree, whose symmetrical top pushed well up close under its highest limbs.

Cuttings seemed to be falling from the poplar, and I concluded that my squirrel had gotten his breakfast in the hickory and carried it to the poplar to eat. But now on closer inspection it seemed that another stream of cuttings was pouring from the hickory, and I congratulated myself on having two squirrels within range.

I have often heard hunters tell about eight or ten squirrels up one tree, but have thought—charitably speaking—it probably was where trees were very scarce, or squirrels unusually plentiful.

From an experience dating from early youth, when too young to be trusted with a gun, I used to wheedle old Uncle Peter into lending me his "armah cyarbine,"

ately with their hindfeet, growling and spitting furiously.

I could easily have dropped them both with one shot while in this position, but it was the first genuine mill of this kind I had ever seen, and altogether too spicy an entertainment to interrupt. Finally one broke away and retreated up the tree, while the other, seemingly victorious and fully satisfied, crawled up and sat upon the limb, master of the situation, but considerably disfigured.

Concluding that it was about time for foreign intervention, I drew on the retreating pugilist and dropped him, clean killed, with the right-hand barrel of the 16-gauge; then turning my attention to the other one found that he had not moved, further than to crane his neck over the limb to peer down to the ground, where lay his late antagonist. With the left barrel I laid him quiet within a few feet of the other.

At the last shot I heard a rustle, and looking up saw another squirrel making down a long limb of the hickory toward the poplar, and shoving in fresh shells opened fire on him as he ran.

Hard hit at the first shot, he fell, but caught with his forepaws on a limb half way down and began trying to swing back on to the limb, with lots of climb left in him. Giving him the second barrel, I had the satisfaction of seeing him drop quietly down by the two already shot.

Just then another squirrel jumped from the hickory to the poplar, and from there—before I could look—into a

A VISTA FROM THE TRITON CLUB HOUSE. See page 168.

told of a squirrel making for his breakfast in a near hickory. Then came the rattle of nails as he rushed down the scaly bark of a white oak; another faint "swish" and he is safe in some near-by hickory without ever showing fur. But this is no cause for discouragement, for so soon as his toilet is complete, and the tattoo of the woodpecker's ivory on a dead limb announces the near approach of the "king of day," he will begin to shell and cut nuts with a greedy abandon that will quickly lead to his detection. The first squirrel actually located resulted in a most disgusting fumble, as it took four shots to bring them to bag. This will occasionally occur with the best shots, and is hard to explain satisfactorily, but is probably most often due to the thick leaves on the tree hiding the exact location, or else shooting at the squirrel's tail when his body is safely protected.

These are the reasons with which I have always satisfied myself for such fumbles when I made them, but after fifteen years of patient effort I have yet to evolve a reason that fully satisfies my shooting companion when he sees me do it.

After this poor beginning, as misfortunes never travel singly, a handicap appeared on the scene in the person of a little darky—Isaac Suh—and the invariable companion, a cur dog.

"He's a fiset, suh! I jes hear you shoot an' cum to see what you had got treed, an' to see if my dawg c'uldn't git him fur you. O, yas, suh, he is a good squel dawg—he good fur all varmints too."

With good intentions, but poor judgment, Isaac and the "fiset" followed me about, making noise enough for "beaters" instead of "stalkers," until we had found and killed two very unwary squirrels, then to his sincere regret he found that he "Mus' be gittin' 'long down to de pea patch to pick peas."

Left thus dependent upon my own resources, I followed a fence row for some distance, listening intently

and run off hunting, to the present time, when I am using my second hammerless, I have yet to find a greater number of squirrels than five in one tree.

In those dear old carbine days of long ago, when after tramping for many weary miles I sometimes returned successful and triumphant with one poor little half-starved old squirrel (probably an escaped pet) and proudly carried him the full length of the main street, the admiration and envy of all the other boys, I did then occasionally tell about six or seven or ten that I found in one tree, and fit each one with a fearful and wonderful narrow escape from my deadly gun, but now apologize for any of those stories, unforgotten and unforgiven.

I had made out my squirrel in the top of the poplar, and was proceeding to draw on him, when his companion in the hickory, incensed by some insult, real or fancied, dropped the nut he was cutting on, sprang into the poplar and assaulted him in the most vicious and apparently unexpected manner.

I instantly lowered my gun, as a game fight is better than any game to me.

There was some very loud and seemingly profane conversation for a few moments, and a terrible threshing in the leaves in the tree top, then the fray took shape as one, feeling that he was not holding his own, started to retreat down the tree, with the other in close pursuit. Down they came with a rush that sounded like scraping a bushy limb down a tree trunk until they were almost to the ground. Circling the tree, they flew back up about half way to the top, when the pursuer overtook the pursued and they clinched.

Such a fight I never imagined possible for anything less wicked than a pair of dissolute tomcats. They plied tooth and nail, and the fur flew. They lost their balance and fell, close clinched, to a limb roft. below the one they had been fighting on, and over this they hung, one on either side, gripping each other's head, clawing desper-

tall white oak. He was evidently desperately homesick and losing no time.

This was more than I bargained for, and it rattled me considerably; but after a little time lost by trying to crowd both shells into one barrel I got loaded and opened fire, making a beautiful clean miss with both barrels. He was too far away for safe shooting and rapidly increasing the distance, but as quickly as possible I reloaded and threw two more loads of shot after him, with no other result than to make him jump about twice as far as usual each shot.

Waiting for a few moments to see if the old hickory concealed any more surprises, I gathered up my game and made my way to the house in time for breakfast.

I had been out less than two hours; had bagged six squirrels; umpired a game fight; done some fast shooting, and developed an extraordinary appetite. Altogether, created a red-letter day for hours of reminiscence.

LEWIS HOPKINS.

Mowing Machines and Nesting Quail.

CENTRAL CITY, W. Va.—A land-owning sportsman living about four miles from this city, has a good and perhaps novel plan for keeping up a fair supply of game. The mowing machines, as is quite well known, are the cause of much destruction of the nests of quail.

During the incubating season he takes his dog to the fields which are to be reaped, and by the dog's points discovers the nests of the birds. Near every nest he drives a stake. So at mowing time he leaves the quail undisturbed, with the grass still waving over and shielding her pretty little head, while the dear maternal heart throbs in glad expectation of the first "peep" of a prison-freed birdie, and no doubt with a hearty "thank you" for the kind consideration by the man so merciful—pro tem.

Natural History.

The New York Audubon Society.

THE annual meeting of the New York State Audubon Society was held on the afternoon of Wednesday, Feb. 9, at the American Museum of Natural History. A report was read by Dr. J. A. Allen, of the executive committee, detailing the work done by the committee during the year. Attention was called to the difficulty of carrying on the society's work through a lack of money. Dr. Allen read the report of the secretary and treasurer, Miss Emma H. Lockwood, which showed a deficit of \$64, and comparison was made with the annual report of the Massachusetts Society, which shows a membership of 2,000, with an annual income of over \$2,000, as compared with a membership in the New York Society of less than 400 and a proportionate income. The officers of the preceding year were re-elected. They are as follows: President, Morris K. Jesup; Honorary Vice-Presidents, Mrs. Robert Abbe, Miss Maria R. Audubon, Mrs. Samuel P. Avery, Miss Eleanor Blodgett, Mrs. William C. Doane, Mrs. David S. Eggleston, Mrs. Morris K. Jesup, Mrs. Cadwalader Jones, Mrs. William M. Kingsland, Mrs. Francis P. Kinnicutt, Mrs. Seth Low, Mrs. Charles Russell Lowell, Mrs. Henry Fairfield Osborn, Mrs. James Roosevelt, Mrs. Joseph H. Rylance, Mrs. Frank K. Sturgis, John Burroughs, John P. Haines, George Bird Grinnell, Ph. D., Henry G. Marquand, Right-Rev. Henry C. Potter, D. D., Hon. Theodore Roosevelt, Abbott H. Thayer; Secretary and Treasurer, Miss Emma H. Lockwood; Executive Committee, Frank M. Chapman, chairman; Mrs. J. A. Allen, Mrs. Melbert B. Cary, Mrs. F. N. Doubleday, Miss Emma H. Lockwood, Mrs. Olive Thorne Miller, Mrs. May Riley Smith, Mrs. Mabel Osgood Wright, J. A. Allen, Ph.D., William Dutcher, Henry Van Dyke, William T. Hornaday, Frederick Peterson, M.D., Henry S. Williams, M.D.

Addresses were made by Dr. R. Heber Newton and Mr. Frank Chapman.

The society has recently issued a number of useful documents. Among these are a poster to be set up in public places giving extracts from the bird protective acts of the State, and a letter from Charles R. Skinner, State Superintendent of Schools, calling attention of principals and teachers in the schools of the State to the excellent work done by the Audubon Society, and requesting these teachers to use every effort in protecting the birds. The general circular of the Audubon Society, with a list of officers, appears; also two very attractive short stories, one for boys and one for girls, written by Mrs. J. A. Allen, wife of the eminent ornithologist so well known in bird protective work. A reprint of the United States Department of Agriculture circular recommending the establishment of Bird Day in the schools; a short illustrated explanation of the way egrets are obtained, by Mr. Frank M. Chapman; an essay on the economic value of birds, and an artist's appeal by Mr. Abbott H. Thayer, complete the list of the papers in question.

Appealing, as these do, to a very wide public, it cannot be doubted that this literature will do a great deal of good.

Music and the Dog.

I HAVE a small dog that is remarkably intelligent, a good performer of many tricks and extremely vivacious. He is very good at dancing, from which one might suppose the violin to be his favorite instrument. But quite the contrary. The tone of this instrument seems to cause him extreme anguish. The violinist of the family has an instrument of the purest tone, and he draws a smooth bow. One class of tunes seems no more offensive than another, but it seems that those played in the key of C affect him most. When the music begins he will sometimes leave the room with head down, back arched and tail drooping, at the same time piteously whining. But generally he utters long and loud wails, painfully human in tone and inflection, seeming to come from a heart almost upon the point of breaking; and when the violin is laid down he evinces a relief and satisfaction that are not to be mistaken. And what is most singular is the fact that no other instrumental music seems to affect him; he pays not the slightest attention to it.

In our house a mandolin club meets semi-weekly, and all the noise of mandolin, guitar, violoncello, harp, etc., does not disturb him in the least. I have asked myself the question: Does the tone of the violin affect his head, his nerves, or awaken unpleasant emotions? If the first two, why should not the louder noise of other music affect him in the same way? If the emotions are awakened what must be their character? Are they melancholic, or the emotions of pity for one who seems to be in distress? If of pity why are not his demonstrations to the performer well marked? These questions may remain unanswered, but that this dog suffers when the violin is played is obvious beyond all doubt.

Taxidermy and Sculpture.

Editor *Forest and Stream*:

Being a subscriber to *FOREST AND STREAM*, Mr. Geo. H. Storck's astonishing article under the above caption duly came before me. The style in which Mr. Storck waves aside and banishes to the depths of oblivion the work of all his predecessors in the field of taxidermy is more than superb; it is magnificent. And when I read that "taxidermy has now reached the highest point it ever can attain," I wept for joy that I had lived to see this day.

For several years I have lived along in a slipshod way, honestly believing that Richardson and Rowley and Will Palmer and Prof. Dyche and Aksley and F. S. Webster had done a lot of modeling in making their clay-covered statues, and had done a great deal of it with rare and commendable artistic skill. I have heard

several of those men exclaim: "How much easier it is to model a statue than it is to mount the skin of an animal!" And it has for years been my belief that the production of statues covered with modeling clay, duly modeled into form, and with the skin of the animal duly modeled down upon it, all began in 1882; but Mr. Storck says that "later a few men began to model a little."

I have known one or two men to "fall down" in their work and blame the clay for it all. I once knew a painter who used to curse the canvas because his colors did not look right. There may be other taxidermists than Mr. Storck who do not know how to use clay successfully, but if there are, I am sure a few lessons would set them right. I have seen some hundreds of mammals mounted over clay, and never yet have I seen one that had torn to pieces, or even cracked, that had lost shape or had been "burned" by the clay.

Mr. Storck's pictures of a living horse and a plaster model of it are all right; but neither of them is taxidermy! What we old fogies now want to see is a picture of a horse's skin mounted over such a plaster model as that represented. And what we want to know is, how much it costs to mount a horse—or a deer—in that sculpturesque way. We should like to have Mr. Storck give us an ocular demonstration, and have him prove to us with a photograph of some of his work that in his hands, and by his new and only good method, taxidermy really has "reached the highest point it ever can attain."

WILLIAM T. HORNADAY.

Woodcock Strutting.

SEVERAL articles in late issues of *FOREST AND STREAM* on this habit of the woodcock bring to mind an incident which my brother and I witnessed some five years ago. We were taking a fishing trip to Koskee Lake for bass. About two miles from our destination we had to descend a deep ravine to cross Beaver Creek, a small stream spanned by a bridge. A sturdy growth of alders bordered the rivulet on each side, with numerous gaps through which we could see the water. The road followed close on its banks. As we drove slowly along, enjoying the glorious June morning, we noticed a large saw-log stranded in the shallow water directly in one of these open spaces, and on each end of the log was a bird. We had no trouble in recognizing them as a pair of woodcock.

The one on the upper end of the log particularly attracted our attention by his peculiar antics. He would drop his wings until they touched the bark and then strut down the log 4 or 5 ft., exactly as the gobbler does in the barnyard. He would then turn and strut back again, remain in one place and teeter back and forward a number of times, then stretch his neck to its fullest extent and point his bill directly upward, and then his neck would shrink up until nothing but his long bill and big eyes were visible.

During all this time the bird at the opposite end of the log, which we took to be his mate, remained perfectly impassive and apparently took no notice of the handsome gallant opposite her.

We watched this unique performance for half an hour, not being over 25 ft. distant from the pair. When we resumed our journey the dandy seemed to be as eager as ever to attract the dainty lady's attention. Our only regret was that we had left our camera at home.

KOSHEE.

GRAVENHURST, Ont.

Camp-Fire Flickerings.

"That reminds me."

It had been a very unsatisfactory day in camp. In the first place it had rained hard, effectually preventing the Redoubtable Hunter from bringing in anything but a wet jacket. Then, in the afternoon, it had turned cold, and not a bass would rise to the flies of the Inveterate Fisherman. The tents were full of mosquitoes, the fire refused to burn, and even the Colossal Liar's pipe went out when he removed it from his mouth to expectorate.

"It does beat the world what luck some people have," said he, as he struggled with a damp match to relight the briarwood. "Here we have been for four days, and not a blamed bass worth taking out of the water, while not even old Redoubtable there has done anything for the delectation of our palates. Wish I had gone trout fishing instead of trampoozing away up here."

"Wish you had too," said the Inveterate Fisherman. "It would have saved us many a painful stretch of the imagination in following some of your truthful stories."

"Well," exclaimed the Major, "trout fishing is not so bad; you are bound to have a disagreeable time of it, anyway, either with the weather or the black flies or the general cussedness of the lay of the land; and if you do get a nice basketful of fish, why, bless your heart, no king ever sat down to a finer spread than they afford."

"Speaking of trout," said the Colossal Liar, "reminds me that the first trout I ever caught I captured on dry land."

A groan from the Inveterate Fisherman followed this remark. He muttered: "Now we are in for another, and no place to run to."

"Yes," calmly went on the Liar, "I was hunting once"—a snort of disgust from the Redoubtable—"along the bank of a small stream in Onondaga county, New York. There were thousands of muskrats living under the banks, and the bottom of the stream was covered with ears of corn which they had dragged into the water from a nearby cornfield. Suddenly I saw a big fellow poke his nose out of a hole directly opposite me, and instantly I drew up my rifle and fired at him. With the report a beautiful trout darted out from under the bank at my feet, and went flashing away up the stream. I knew that the water ran very shallow only a few yards above, so I hurried along after the fish, and when he took refuge under a stone I scared him out again with a bit of pebble. He kept right up into still shallower water, and finally reached a place where he could not swim. He continued flapping along, however, until he actually

threw himself out on dry land, and I ran to him, tossed him on to the grass, rapidly scooped a tiny pool in the gravel and put him in it. Then I went to the house, about half a mile away, got a large pail and brought the trout home, where I put him in the deep well."

A great cheer arose from the party at the conclusion of this tale, in which all joined but the Redoubtable Hunter. He sat silently chewing the cud of reflection until the noise had subsided; then he, too, broke forth:

"That's a pretty story; do you suppose anybody is going to believe that yarn?"

"Yes, sir, I do," replied the Colossal Liar; "and if anybody here doubts it, all I have got to say is, let him come with me up into Onondaga county, and I will show him the very creek and the very well."

"That's very well—" began the Story Teller, but at this point the Hunter broke in again.

"Now," he went on, "if you want to hear a true story of how I shot my first rabbit with my boot, I will tell it."

The Fisherman started out of the tent rather hurriedly at this, but it had begun to rain again, and he had to return and take his medicine with the rest of us.

"You see, it was this way. When I was a boy I worked on my uncle's farm in Oswego, N. Y. We had been mowing hay in the orchard, and it lay in great swaths, ready to be cocked up. We were engaged in this work, each with a fork, when all of a sudden a rabbit ran out from under the hay near my feet, and it tore away through some long grass that had not yet been mowed. I instantly dropped my fork and ran yelling like a young Comanche Indian after him. The grass was so heavy and long that bunny could not make very fast progress, and I rapidly gained on him, as I could see by the undulating movement of the grass. All at once he stopped short, and I was so near and going so fast that before I could check my speed I had trampled on him with my heel and broke his neck. And that is how I came to shoot my first rabbit with my boot."

"That reminds me," said the Major, "of a little experience I once had in the Michigan woods with a deer—"

"Hurrah! there she blows!" cried the Inveterate, as a mighty bass broke the water right in front of the tent. The last of the cold shower was over, the sun was peeping out from a mass of scattering clouds, and only the Colossal Liar remained, sympathetically, to hear the Major's yarn.

D. F. H.

NEW YORK.

Lon Shirliff, in the early 60s or the later 50s, was a resident of Quasqueton, a little town on the Wapsipinicon River, in the State of Iowa. He resided, we said, but, more accurately speaking, he "stayed" with his sister, the sweetest and prettiest woman in the village, who was a teacher in the town high school. Lon in legs was the antithesis of knock-kneed, his shoulders sloping as we see in statues of Venus; long neck and arms, and straight as the Decalogue. He had two failings. He was lazy. The ague tackled him, but had to give it up, for he was too lazy to shake, and he was inordinately and uncompromisingly truthful—too lazy to tell a lie. The only thing he could or would do and do well was to fish. The fish would come to his hook as natural and easy as love to a gum-chewing miss or cats to an old maid. Pickerel were his favorite, and the civilization of the "Wapsie" not yet being up to spoon and the fly, his recourse for bait was the tail of the bullhead, which he had the knack of putting in most tempting form for this royal fish. His habit, after dissection, was to toss the bullhead back into the water, possibly to give it time to reflect and prepare itself for that bourne from which no bullhead was ever known to return. Certainly bullheads are deserving of a "happy hunting water," more so than some of those who hook them. And so, one day, Shirliff, trolling for pickerel, caught the same bullhead with its own tail. This is no idle tale. He said so, and to those who knew him that was enough. If he had been a common piscatorial liar he would have caught it several times.

E. P. M.

Green Mountain Notes.

MILTON, Vt., Feb. 17.—There has been comparatively little hunting in Vermont thus far this season, on account of the extremely unfavorable weather, and the good days that come few and far between are of little use, for the deep snow in the woods makes hunting a hardship. Rabbits are very plentiful, and a bag of half a dozen, even without the help of a dog, is a common occurrence. The favorite method of hunting is to go to some place where birch trees have been recently felled. Around the birch-brown heaps the rabbits congregate to feed on the tender buds, and when alarmed manufacture tracks in double-quick order for safety; and to many of the bunnies flight does mean safety, for it requires a steady hand and an alert trigger finger to pot a rabbit with full head of steam on.

Partridges are almost a thing of the past. In the thickets, where they formerly existed in flocks, only an occasional bird is seen, and the fact is evident that the grouse must be wholly protected for a time, else total extermination will be the result. The pheasants introduced here in Vermont several years ago by Dr. W. Seward Webb seem to be suited to our frigid winter climate to perfection. On the estate where they were first introduced, in the town of Shelburne, they have greatly increased in numbers, and have spread over a considerable area of surrounding country, and have, as a result of protection grown so tame that they frequently come to the farm buildings in search of food, and often mingle with the farm poultry. Unfortunately, they build their nests in the fields, where the mowing machines destroy many eggs and young. Birds have also been set at liberty in this place and at Sheldon and St. Johnsbury, and in spite of persecution from law-defying hunters are reported as doing well. KENEWAH.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Game Bag and Gun.

CHICAGO AND THE WEST.

Sheep and Snowshoes.

CHICAGO, Ill., Feb. 12.—Mr. Calvin S. McChesney, of Troy, N. Y., who was my companion in the winter hunt in the Blackfoot Reservation last year, starts next week, in company with Mr. George B. Harrison, of Troy, for another try after a specimen or so of sheep and goats. Mr. J. W. Schultz, of Kipp, Mont., will again be the guide. The party will make the goat hunt first and then move into the Two Medicine Valley after sheep. Mr. McChesney says he is tempted to take his umbrella along again, but I am moved to urge that he leave it at home. Should he do this, I am satisfied that we will get his ram's head this time sure, for the game is there, and Mr. McChesney was only prevented last year by the worst kind of hard luck from getting the coveted trophies. The work of the snowshoeing and winter camping will be all the easier this year, and I not only wish him, but prophesy for him, full success on a trip in which it would give me the greatest pleasure in the world to join.

Mr. Schultz wrote me this week from Kipp, Mont., saying that he has some good grizzly bear country located, if I knew of any one who has lost a bear.

Mr. Fletcher Walters, of Arlington, N. J., asks for a little advice about snowshoes.

"I am led to believe," he says, "from reading your various articles of trips taken on snowshoes, that you understand these things. I expect to make a trip this winter in which the Canadian snowshoe will figure to a great extent, and having had no experience in their use, I thought I would ask you for some advice. Will you kindly tell me what you consider the proper foot gear and leg covering for shoeing; also the best method of securing the shoes to your feet to insure comfort and to hold the shoe properly in position. I know enough of shoeing to know that people differ in their method of adjustment, and of the different ways some must be better than the others. Please give me your method."

I have at times spoken of the best foot wear for snowshoeing. In the very far North, where the cold is steady and the snow very dry, a large moccasin with plenty of socks under it is good foot wear. For any country where the snow is apt to melt and soften, the moccasin does not compare with the soft, heelless rubber known as the Gold Seal brand. This rubber is not stiff, but soft as a moccasin, and the shape of the toe makes it far easier on the foot than a moccasin, since the straps cannot chafe the foot so much. In some Western towns these rubber shoes can be bought with a leather top. I sewed canvas tops on my own. In dry snow they do not need any tops. In any snow they should be worn over two or three pairs of heavy stockings, the felted German sock being best. This does not mean the felt boot of the teamster. Nothing stiff or hard must be worn about the foot. I should use this Gold Seal rubber for any snowshoeing in the United States. If I were going into an arctic country I might prefer the moccasin, or would use the rubber very large and over duffle socks.

As to the snowshoes, it is much a matter of fancy. I have tried many varieties, from the New Brunswick flat bow to the Montreal turned toe, and the lumbermen's oval, from the bear-paw round to the narrow Cree model shoe, and the still longer shoe used by the sub-Arctic Indians. As I stated in the story in the trip which Mr. McChesney and I made together, I took with me a pair of "Alaska model" snowshoes sent to me by Messrs. Metz & Schloerb, of Oshkosh, Wis. These shoes are 5ft. long, 1ft. wide, and have a strongly upturned and narrow toe. We tried several sorts of snowshoes on our winter trip in the mountains, but all liked these Alaska shoes best. Mr. McChesney tells me that he has ordered two pairs for his trip this month. These shoes are the best I ever used. I do not like a flat-bowed shoe. The upturned toe of these shoes prevents all tripping on crust, and always keeps one's feet up and forward, which is what you want. The long heel keeps the shoe down behind, which is also what you want. As to needing a short and broad shoe for brush work, I cannot see the utility of such a model. With the Alaska shoes I can go anywhere that a man can go with the Canadian shoe, and some places where he cannot go. In hill work the narrow tread of the shoes was found a benefit, and for a long, steady tramp they are the easiest I ever got into.

The question of straps is far more complex. All there is to snowshoeing is the straps. If the tenderfoot gets the right straps on his shoes he can walk off at once, and will never know anything about *mal de raquette*. Thong ties have been used on snowshoes because the men who use the snowshoes had no other kind of straps. They are an abomination when once you have had the right kind of straps. These I cannot very well describe, but will try once more to do so roughly. The toe strap is a permanent one, made with a buckle so that it can be tightened or loosened at will. It is about 3/4 in. wide, is made of stout leather, and passes over the toe, through the side holes and under the bottom of the foot beneath the shoe, thus stiffening the webbing. To prevent the buckle from hurting the toe, a broader and softer piece of leather is let under the toe strap by means of loops, like a collar pad under a hame strap. On level ground a good shoer does not need much of a strap excepting the toe strap, but when it comes to hills it is different. In this rig a heel strap, provided with a buckle like a skate strap, is fastened to the sides of the toe strap, close down to the shoe. This is made of harness leather about 1 in. wide. It rests on the heel below the ankle cords, and is kept from falling below the heel by means of an instep strap. In putting on his shoes with such a rig as this, the snowshoer kicks his toe into the toe strap, fastens one buckle on the side of his foot on his heel strap, and the thing is done. Such straps do not chafe and do not stretch a great deal. They hold the

foot firmly and yet loosely to the shoe, which is what snowshoe straps should do. Thong ties would kill a man in the mountains, but we found this harness very comfortable and effective.

In Arizona.

Mr. J. S. Cullinan, of Chicago, who is spending the winter at Phoenix, Ariz., writes me that for the past two weeks they have been having fine weather; average maximum temperature, 75 degrees. There is no wind and the air is still and clear, a characteristic of southern Arizona. Mr. Cullinan says the climate is the finest in the world in winter.

"Summers, as you know, are very hot," he says, and adds: "I have been hunting jack rabbits and shooting at quail with a Winchester 'pump gun.' I can't get used to the way the quail rise, without letting one know they are going to flush behind you; mostly, therefore, my bags are indifferent; but it's sport."

Poisoning of Doves.

Near Folsom, Cal., a farmer named Daniel Faukenheim put out a quantity of wheat soaked in strychnine for the purpose of killing the doves which were feeding on his grain. Game Warden Helms went out to investigate the matter, and found some 2,500 dead doves scattered about. Under the law there was no penalty for this destruction.

Spring Shooting in Iowa.

At the instance of the Dubuque Gun Club, of Dubuque, Ia., Representative Nolan has introduced in the Iowa Legislature a bill prohibiting the spring shooting of wildfowl. This is quite in line with the recent stirring up of protective matters in the middle West, and it is all the more gratifying in that the measure originates from a point on the Mississippi River, along which stream a good many shooters live who do not believe in cutting off the spring duck shooting. It is to be hoped that the measure will carry. Minnesota is almost certain to eventually adopt a law prohibiting spring shooting. Wisconsin has already partially adopted such a measure. Illinois may do so in the course of a hundred years or so.

A Chicago Rabbit Hunt.

We were about out of meat at my house this week, so I thought it was time to go on a big winter hunt, and my friend Organ being in somewhat the same condition, to say nothing of John Watson, who had not had a taste of rabbit for months except in the way of charity, we three took the trail to see what could be done. As there were ladies, dogs and snowshoes mixed up in the enterprise, it took on something of a tribal nature, and the party was freely accepted by the public as a portion of the Klondike hegira, though really we were only going to Maksawba Club house on the Kankakee River, where the main herd of rabbits had lately been located by the runners of the tribe.

This was the first time in many years that I have deliberately gone out hunting for rabbits, but it was like going back to the old love of one's youth. When I went out hunting for the first time it was with my father, for rabbits, and I believe the first thing I ever shot was a rabbit. The occasion I remember very well. The rabbit was discovered solus, sitting under a brush pile, wrapped in thought. I was too small to hold the gun, so my father held it and trained it on the game, allowing me to pull the trigger. Methinks there must have been some slight movement of the muzzle of the gun, for instead of striking the rabbit in the head it caught him about midships, and all that was left was, in the words of the poet, a rag, a bone and a hank of hair. We did not eat that rabbit. Yet in those days, the deer and turkeys and even the quail being exhausted, my father and I were wont to hunt rabbits very faithfully, and we had the old smokehouse about full of skinned and frozen rabbits all the time, much to the disgust of everybody else connected with the domestic economy.

I remember that in those days many of our neighbors would not eat rabbit, saying they would as soon eat cat. This, as Mr. Organ very justly remarks, depends largely upon the way one has been raised. I always preferred rabbit, and I have known for many years that rabbit is good to eat if you know how to prepare and cook it—the younger and fatter the rabbit, and the nearer to a cornfield, the better.

But I digress from the winter hunt. Mr. Watson, Mr. Organ and myself, with the rest of the village, left Chicago at 5:40 in the evening and reached Maksawba Club house, sixty miles down in Indiana, at about 8 o'clock. We found that Ira Pease, the keeper, with his good wife, were ready for us with a good, hot dinner, and they told us the rabbits were fairly running away with the country. We passed the evening nicely in the historic assembly room of old Maksawba, and by 8 the next morning were hungry again. Such buckwheat cakes, such cream and honey and butter are not to be found anywhere else upon the range.

After breakfast we all piled into a big wagon box sled, three couples of us, a driver, Melville Fancher, one of the club pushers and guides, who was born and raised on the Kankakee bottoms, and knows all its game the season through. It was a pleasant winter day, and the snow was just right for rabbit hunting, so everybody was happy. We drove about a mile, and Fancher stopped us at a brush patch of a few acres.

"We ought to pick up two or three on here," he said, and so, indeed, we did. A rabbit started off to the right and crossed near Mr. Organ, who tickled it a bit, but did not stop it. I killed it a few moments later at the edge of the thicket to the left. This afforded the ladies no idea of things, as they were off at one side, but a moment later, when John Watson had them all paternally in charge, he instructed them all to jump in concert upon a certain brush pile. They did so, and squealed as a nice, fat rabbit ran out from under their feet. This John Watson did not stop promptly, so the rest of our battery cut loose at long range, and finally the dog caught the rabbit, much to the delight of everybody. Then we went on again over a bit of grass. Fancher's dog Queen pointed hard and fast, and we knew we had a rabbit sure. Queen is a pointer, but the ethics of the Klondike require a dog to point everything, including

mink and skunk. This rabbit Roll Organ kicked out, but he only threw snow over it with his close-choked gun, as it dodged for cover. John Watson was at one side, and both John Watson and I wiped Mr. Organ's eye. The ladies began to think rabbit hunting was a lot of fun.

We now got into the sleigh again and drove a couple of miles further, stopping at one of those timbered islands peculiar to the Kankakee country. Here we fell foul of many rabbits, and each gun picked up one in a few moments, the ladies, who tramped close up, dressed warmly and shod with heavy stockings and moccasins, seeing all the fun very comfortably, and getting quite into the notion of the sport. We walked slowly around a hundred acres or so of this cover, and by the time we got back to the sleigh we had eleven rabbits in all. Then we drove back to the club house and had a good lunch. Isn't that a Sybaritic sort of way to go rabbit hunting?

After lunch we took our time, and drove off in a different direction to another stretch of scrub oak cover. It was now colder and snow began to fall, but the weaker members of the hunt were game and resolved to finish the day. We jumped three rabbits before we had gotten well started, Messrs. Watson and Organ doubling on one very long shot in open woods. The falling snow had covered all the old tracks so that we could see the fresh record of the woods before us. Tracks everywhere, so that one would have expected to see a hundred rabbits, but, rabbit fashion, the makers of the tracks kept well on ahead. Fancher now told us to spread out in line and meet some of these rabbits as they came back in their circle (as the rabbit will nearly always do). This we did, and John Watson picked up four rabbits at his end of the line in a little while. Then Fancher stationed us all on stumps and began a wide circle, giving tongue in an excellent imitation of a hound—the very last of the Kankakee marsh hunters' tricks I have seen put in practice. The rabbits, thinking that now all was lost, began to scurry about, and once in a while we got a shot. Cramped up on my stump top, I missed one easy shot, which Roll Organ bettered a moment later as the rabbit passed him. Then a very sportsmanlike chorus from the ladies of "Mark! Mark!" drew my attention to a rabbit that looked about as big as a cow, which I added to my pockets. Thus it went, and in a little while we had nine more rabbits, which we voted quite enough for all our wants. It was something of an old story for us men, but the experience for the ladies was new and interesting.

That night it snowed very hard, and the next day there was in full swing the great storm which passed on east of here this week. The temperature was lower and the air was so full of flying driven snow that one could hardly see. It was too much for the ladies, and as we had all the rabbits we wanted, Mr. Organ and I turned it into a snowshoe expedition and had a nice tramp, without any guns at all, the snow being perfect for that sport.

We came back to the city that afternoon, considering that our winter hunt had been very much a success. We have meat in our houses now. Let no man scoff at rabbit, lest thereby he betray ignorance alike of venery and cookery. Let me describe. As soon as a rabbit was killed Fancher eviscerated it with a long cut and a sharp flint of the body, grasped head and foot in his two hands, an operation which did not soil his hands. This should always be done as soon as a rabbit is killed. At home I personally conducted the rest of the operations, relying on my early training and not on that of any cook. I picked out the smallest and fattest rabbits, skinned carefully and dressed them nicely. (To skin a rabbit, break the skin in the middle of the back and pull the hands apart, one-half of the skin thus coming free in each hand, and no hairs being left on the flesh.) Then I butchered out my venison carefully, throwing away all blood-shot pieces. I cut off each hindleg and then cut a couple of sections or saddles across the back, trimming off all the thin flank meat up to the edge of the loin. I carved off the forelegs, taking out the shoulder blades nicely. The meager and bony residue of the rabbit I discarded, and thus I got a platter full of fine, firm, red and white meat, as nice looking as any venison that ever was. This meat can be stewed or boiled gently for an hour or so, and then fried and served with a thick brown gravy, and prepared in this way it is tender, delicate and toothsome. It can be fricasseed like chicken or can be broiled or fried direct without parboiling. A friend to whom I gave some rabbits said that he had them broiled whole, basted with butter, and he declared them good. Others like to soak the meat over night in water slightly salted. I think myself that a rabbit is improved by being hung up dressed and allowed to freeze for a few days. Somewhat depends on the way a rabbit is cared for when shot and in the manner in which it is dressed and cooked, but depend upon it, the individual who says rabbit isn't good is one who says so because he doesn't savvy how to kill, carve and cook it. Cats, forsooth! I will go bail that anyone who ate one of our Maksawba rabbits would never have cared to go back to cat again so long as he lived!

Notes.

At Necedah, Wis., on Feb. 5, ex-Member of the Legislature Wheelihan was fined \$129.99 for shooting partridges out of season. Mr. Wheelihan may thus be placed upon the list of sheriffs, wardens, justices of the peace, etc., compiled by the FOREST AND STREAM during the past two years, of persons in high places who have not been above breaking the game laws.

At the Wardens' Convention here last week the odd information came up that Michigan has a statute prohibiting the hunting of squirrels by means of ferrets. It is stated that this measure is the remnant of a session in which it was jocularly attempted to pass a law protecting the Spanish mackerel in Lake Michigan.

This same Wardens' Convention was held at the Great Northern Hotel, and in the course of the proceedings Mr. Davis, of Michigan, asked Warden Loveday what was the law on venison in Illinois. On being told that it could not be sold at this season, Mr. Davis said he had bought some that day at his lunch at the Great Northern Hotel! At least, it was listed as venison, though it did not taste like anything. Mr. Loveday said he valued this as a tip.

The old organization known as the Cumberland Gun Club was recently merged into a new one known as the Cumberland Lodge Club, with thirty members, the membership being full at this date. This club takes over the property of the Cumberland Gun Club. Treasurer Henry Stephens tells me that the item in regard to the unpaid taxes of this club arose from the fact that the taxes for 1896, running under the name of the Cumberland Gun Club, were unpaid until recently. The grounds near Lowell, Ind., will be maintained as the home of this representative shooting club.

Prof. Frank Russel, a graduate of the State University of Iowa, 1892, has lately been elected Professor of the Department of American Archaeology and Ethnology, recently established in Harvard College. It was Prof. Russel who, after his graduation, made the trip for the Iowa University to the Barren Grounds of the far North in search of specimens of the musk ox. He made this trip with no blare of trumpets either before or after its accomplishment, yet his was the most successful enterprise of the kind ever attempted. He was gone nearly two years in all, and secured a number of perfect specimens of the musk ox, with much other material for the museum of his university.

Mr. Ruthven Deane, of Chicago, reports for the committee on bird protection to the American Ornithologists' Union that he finds in January of 1898 a distinct advance in the work of the Audubon Society. He finds that about 75 per cent. of the hats worn are trimmed with feathers, but only 25 per cent. of these are the feathers of wild birds. The feathers of domestic fowls are made up and dyed in imitation of those of wild birds. This, however, does not prevent the insatiate demand for the plumage of the egret, for Mr. Deane learns that one wholesale millinery house in Chicago last fall sold \$5,000 worth of egret plumes. The heron roosts on the Kankakee River have not been troubled much this year, and the birds are increasing.

This Looks Familiar.

CHICAGO, Feb. 14.—A friend sends me a clipping from the Los Angeles Daily Times of Feb. 1, this being an article on the small game of California, written by Count Jaro von Schmidt. The latter goes on to recount the different kinds of game found in that State, and speaks of the causes which have led to the decrease in the supply. He then goes on to say:

"Now a new danger threatens, which is more serious yet. It is the wholesale gathering of eggs in Alaska and on the northern coast by the natives, who find willing purchasers at the many mining camps and fish-canning factories. The eggs of geese and ducks are gathered whether they are fresh or incubated (and, therefore, unfit for human food) and sold by the cartload.

"If this vandalism is not stopped by our Legislature, our coast will be soon stripped of their visitors from the North, who add so much pleasure to our sportsmen and to our table every fall and winter. The present game laws of California are now fairly good, and it is hoped will be enforced more and more, as the citizens of the United States see more plainly the absolute necessity of protection."

Rabbits.

At a jack rabbit hunt held at Garden City, Kan., last week, 1,205 rabbits were killed in one day, an average of thirty to each gun.

At Perry, Mo., 1,800 rabbits, cottontails, were killed in one day in a side-hunt in which thirty men were engaged. The losing side, captained by R. M. Judy, paid for the oyster supper last Tuesday night.

In one day this month 80,000 rabbits were received in the St. Louis markets.

The tempest in Ohio over the rabbit law seems to resolve itself into the clamor of some individuals to want to shoot rabbits all the time. The claim that the rabbits would eat up all the farm produce is more imaginary than well founded. Mr. Volney Rogers, of Youngstown, has this to say about the rabbit law:

"I think our game laws should be enforced, and that the law as to rabbits should remain as it is. Farmers are authorized to destroy them now if found doing damage on their own premises, and if all protection is removed it will simply result in poachers hunting and killing all kinds of game at any season, under pretense of hunting for rabbits."

Mr. D. J. Hotchkiss, of Fox Lake, Wis., writes me that they are having considerable sport rabbit hunting in that country just now, and that rabbits are very abundant. He speaks also of the killing of two fine specimens of the Arctic owl.

Is this the Fantail?

In the Proceedings of the Biological Society of Washington, dated Jan. 27, 1898, Mr. Edgar A. Mearns describes what he claims to be a distinct species of deer, stating that the typical animal from which he made his studies, as well as other specimens, will soon be placed in the United States National Museum at Washington, D. C. Mr. Mearns, in his report on this species, says:

"The small white-tailed deer of Texas differs so materially in size, proportions, coloration and cranial characters from the other members of the *Dorcelaphus americanus* group as to necessitate its separation. (Scientific description given in full, of which the following is a part.)

"The horns of the type approach those of the Sonoran deer, *Dorcelaphus couesi* (Coues and Yarrow), in size and form. There are two basal snags, one directed upward and backward (length 75mm.), and one forward (length 37mm.), with four additional points to each horn, making twelve points in all. The length of the beam, measured to end of anterior point, following the curves of the horn, is 440mm. The horns are symmetrical, their longest points measuring 175mm. in height. The beam is strongly curved upward, forward and inward, the tips of the anterior tines approaching within 70mm. of each other. The total expanse of the horns is 330mm.; the circumference of beam, at base, 80mm.

"Remarks.—Numerous skins of this deer from Texas and Mexico south to San Luis Potosi have been examined, and found to agree in size and coloration with those above described. The horns vary within ordinary limits, but those of the type represent the usual size and form,

except that there is more often but one basal snag. The bucks weigh in the neighborhood of 100lbs. and the does about 75lbs.

"While the Texan deer differs sufficiently from the white-tailed deer of southern Mexico and Central America, as well as from the forms recognized in the United States, to warrant its separation, the available material is insufficient to furnish a reliable indication as to its intergradation with them. Therefore, for the present, it is proper to regard it as a species."

Mr. Mearns goes on to compare this new deer from Texas and northern Mexico with the white-tailed deer of Virginia and Carolina, with which he conceives it cannot agree, more especially in its relatively heavier dentition. Neither does he find it coinciding with the Florida deer (*Dorcelaphus osceola*). Nor can he observe it to agree with *Dorcelaphus macrourus* (Rafinesque), "a large pallid form of the northern plains region, characterized by restriction of the dark and corresponding expansion of the light areas. It has widely branching, often scraggy horns, very different from those of *D. texanus*." He goes on to say:

"The only remaining deer of the United States requiring comparison with the small Texan species is the Sonoran deer, *Dorcelaphus couesi* (Coues and Yarrow), a still smaller and more pallid animal, having much larger ears, on which the black edging and tips were wanting. The dentition of *D. texanus* is much heavier and the tail considerably shorter than in *D. couesi*.

"The only Mexican deer with which the present form requires comparison is the animal that has been known by the specific name *mexicanus*. This name was first applied by Gmelin. According to Dr. J. A. Allen, 'the *Cervus mexicanus* of Gmelin, however, is a vague composite species, only in part referable to deer from Mexico, and in all probability has no relation to the little Sonoran deer described by Baird.' The name *mexicanus* may, however, be regarded as fixed to a deer of southern Mexico, very different from the Texan deer."

The type taken by Mr. Mearns was collected in Kinney county, Texas, near Fort Clark. I regret to note that the tail is mentioned as shorter than that of another deer, but it may still be long enough to allow it to fill the description of the animal we used to call the "fantail deer," over which so much discussion has arisen at one time and another. Those who scoffed at the fantail idea said that they knew this little Texas deer, and that it was the same species as the white-tailed deer (*virginianus*). Since Mr. Mearns has now, in the fullness of time, come forward with the contention and the scientific proof that one small Texas deer is a species distinct from the ordinary white-tail deer, what ground is there left for the scoffers to stand upon who once declared the "fantail" species impossible? If *D. texanus* (Mearns) is a distinct species, it either is or is not the fantail deer. If it is the fantail, we old-fashioned hunters are vindicated on the spot. If it is not the fantail, we are vindicated anyhow, for the point is established that *virginianus* (or *americanus*) does not cover all the deer with white tails in Texas, and to grant a part of the contention is to grant it all. No scientific man would accept the hunter's name of "fantail," but it is very possible that if a hunter brought the scientific man a fantail he might call it *Dorcelaphus texanus*, "a new deer." Really it would not be a new deer at all, but an old deer, about which the hunters knew and talked long ago. The scientific name of the animal would not interest the hunter, but he would know the species by his own keen and trusty eye and under his own name, the latter far more permanent than the scientific nomenclature, which, meant to be indelible and permanent, is really the most changeable thing in the world (as witness the secession from the time-honored *Cervus virginianus* to *Cervus dama americana*, which is now claimed to antedate the former by seven years!)

Really, it would seem that everything in the world will come to you if you only sit down and wait. For many years I stood with the hunters against the scientists, who said we had but two species of bears in America, the black and the grizzly. Along comes Dr. Merriam and hands out more species of new bears than you could shake a stick at. For the hunters and the fantail I also held out, and here is Mr. Mearns with a fresh package of fantails and a basketful of proof of what the hunters knew. Some of these people are going to feel mighty bad some day, when I come blowing in with a fresh hornsnake showing a spike in his tail about a foot long.

I am indebted to Mr. Charles Hallock for the copy of the Proceedings of the Biological Society showing the discovery of the new species of small Texas deer.

Wisconsin Deer.

It is stated that in Douglas county, Wis., this year nearly 1,000 deer were killed. Four years ago 2,300 were killed there. In the past ten years, it is believed, fully 15,000 deer have been killed in that county alone. Old hunters say the deer are as abundant as ever there.

1206 BOYCE BUILDING, Chicago, Ill.

Michigan Quail and Snow.

ZILWAUKEE, Mich., Feb. 15.—In your issue of Feb. 12 I saw a letter of Mr. W. B. Mershon's, under the heading of "Winter and the Game," in which he says he fears that the snowstorms and extreme rough weather will kill the quail. Now, agreeing perfectly with Mr. Mershon as to the amount of snow we have had, but having the occasion to be over last fall's hunting grounds after the snowstorms, I found fully as many quail signs, and in fact saw as many birds, as at any time after the season closed. As to mink, they are scarce here, and we have nothing to fear from them; so, unless something unforeseen happens, we will have good shooting again next fall.

H. L. B.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Game Laws of Long Ago.

THE general public is prone to think that laws for the protection of fish and game constitute an innovation upon the rights and privileges of the people; but there are many, a great many, thinking people who strongly approve the efforts which are being made to save thoughtless people from the dire consequences of their own beliefs and acts. Game laws are not an invention of the present; they are, in fact, almost as old as our colonial history. The need of such protection was felt 200 years ago, when game was far more plentiful than it is now, when there was an honest disposition to preserve it from wanton waste, as there is now. Doubtless there were men in those days, as there are now, who cried out against game law legislation, men of such selfish disposition that they cared for naught but to gratify their own greed in all walks of life.

It is a somewhat curious fact that all along in the statute books, from the laws established in 1665 by the Duke of York for the government of the Colony of New York to the present time, there are protective laws for game and fish, and some of the earlier laws were even more strict than those in these days. The first edict issued by the Duke of York related to the destruction of wolves as being one means of protecting game. It was somewhat odd in its character, sufficiently so, perhaps, to warrant its reproduction here:

"If any Person, either Christian or Indian, shall at any time bring the head of a Wolfe or Wolves to any Constable upon Long Island, the said Constable is required to Call two of the Overseers to him and then and their to Pay and Satisfie such Person or Persons to the value of an Indian Coat; to be allowed out of the publique Charge in the Toune Rate Provided alwayes that the Constable and Overseers shall require the Oath of such Christians, that bring the head of a wolfe or wolves, that he killed the said wolfe or wolves, * * * that the Constable and Overseers have due regard to such wolfe or wolves brought by Indians, that they appear to be fresh. * * * The Constable and Overseers are to cause the heads to be nayled over the doore of the Constable their to remain, as also to Cut off both the Eares in token that the head is bought and paid for."

In 1683 (Nov. 1) "the Govern'r Council & Representatives in Gen'l Assembly met and assembled" enacted a law in reference to wolves which declared "Thatt whatsoever Christian shall kill a grown wolf upon Long Island; hee shall be paid twenty shillings P. head, in the County where itt shall so happen (the same being proved as in ye Law is set forth), & for a whelp about a halfe a Yeare old, he shall be paid halfe as much." The act also made provision for a bounty to Indians and for the protection of other localities within the Colony of New York.

The first legislation for the protection of game was passed for the Colony of New York in 1705 (Aug. 4). It was then declared that:

"Whosoever within the Countys of Suffolk, Queens County, Kings County, West Chester or Richmond, Christian or Indian, Freeman or Slave, after ye first day of January which will be in the year of our Lord seventeen hundred & five shall kill or destroy any Buck Doe or Faun or any sort of Deer whatsoever, at any time of the Year except only between the first day of August & the first day of January, shall forfeit & pay the sum of Twenty Shillings lawfull money of New York, or in default thereof Suffer Imprisonment for ye time and Space of Twenty days without Baile or Mainprize, unless within that time he or they pay the forfeiture aforesaid. The one-half whereof shall be to him who shall prosecute & sue for ye same before any one of her Ma'tys Justices of the Peace where such offence shall be committed who is hereby Authorized Impow'rd & required to hear & determine the same at his Discretion and the other half to the Poore of the respective County where any person or persons shall be of such offence Convicted.

"And be it also Enacted by the Authority aforesaid That whatsoever Dog or Dogs shall be found hunting or Chaceing any Buck Deer or Faun or any Sort of Deer whatsoever between the said first day of January & the first day of August Yearly shall & may be and hereby are required to be shott and kill'd or otherwise destroy'd any Law to the Contrary hereof notwithstanding, and the Sevrall Justices of the Peace within the said Countys & every one of them are hereby required to Se this Act and every Clause therein put in Execution According to the true Intent and meaning thereof.

"And be it further Enacted by the authority aforesaid that the keepers of the Goales for the Countys aforesaid respectively having a Warrant from one of her Ma'tys Justices of the Peace for that County shall receive Such Offender or Offenders into their respective Goales and him or them in safe and Clase Custody keep for the Term aforesaid on penalty for neglect or refusall to pay Double the Forfeiture aforesaid to be recovered in any of her Ma'tys Courts of Sessions and to be appl'd in manner before Exprest. Provided alwayes, that this Act shall be & remain in full force for the Space of Seven years from the first day of January next & no longer."

This "act" seems to have been so popular that in 1708 "An act for the more Effectual preservation of Deer and other Game and ye Destruction of Wolves and Wild Catts and other vermin" was passed. The act was specifically designed to protect not only deer, but also squirrels, wild turkeys, heath hens, "partridges or quailles, their eggs or young ones at any time of the year except the times and Seasons herein after mentioned and exprest, that is to say, for deer between the first day of August and first day of January and for turkeys, heath hens, partridges and quailles between the first day of August and the first day of Aprill shall forfeit and pay" certain fixed sums of money or be imprisoned.

There was no "Section 249" in those times under which game could be sold every day of the year. And people who object to game laws in these days would do well to consider what effort was made almost two centuries ago to protect game—what economy was exercised. The third section of the act under consideration gives excellent suggestions to legislators, particularly to those who do not know the iniquity practiced under

section 249 of our present code of laws. It reads:

"And for the better Conviction of the Offenders in all or any the Cases abovesaid Bce it Enacted by the Authority aforesaid That whatsoever person or persons with whom shall be found or Shall Expose to Sale any green Deer-Skins, ffrsh Venison or Deers fflsh, Wild Turkeys, heath-hens, Partridges or Quailcs, their Eggs or young Ones, at any other time of the year than what is before Excepted, shall be held, Deemed and Judged Guilty of said offence, and be therefore Convict, unless he or they shall prosecute and Convict some other person to have done the same; and that the same green Deer skins, ffrsh Venison or Deers fflsh, Wild Turkeys, Heath-hens, Partridges or Quailcs, their Eggs or young Ones, so found as aforesaid, or any other probable Circumstance, at the Discretion of the Justice before whom such offence shall be tried, shall be held to be good Evidence in the Offences aforesaid."

Early attention was also given to protecting fish from waste. In 1714 it was enacted that Garrett de Graeuw and his assigns should be singly and alone entitled "to the Fishery of Porpoises during the term of seven years." Here, too, was perhaps the first legislation in this country for the protection of an invention, a patent law, as it were. De Graeuw invented some kind of a contrivance for taking porpoises which was deemed both valuable to the inventor and profitable to the colony, in that it would save fish from waste; so the exclusive use of it was given to him, and "any person who shall undertake to carry on the said Fishery, by the Inventions of the said Garret De Graeuw, contrary to and Frustrating the true intent and meaning of this Act, he or they shall forfeit and pay the sum of one hundred Pounds Current Money."

In 1730 "an act for the preservation of oysters" was passed, and in 1733 a law was enacted for the preservation of the English pheasants.

If this article were not already too long, attention might be called to many instances of the frugality shown by the colony. Wastefulness of all kinds was abhorred. Think as we will, as we look backward from our pinnacle of civilization, there was much in the habits and customs of those "old colonial times" which, if they could but enter into the lives of the people of to-day, would make our boasted civilization still better. D. H. B.

SYRACUSE, N. Y., February, 1898.

An Old Single-Trigger.

"THERE is nothing new under the sun."

As we grow older we realize more fully that the saying is not far from the literal truth, and that whatever we are tempted to call new has been aforesaid in the bygone and forgotten days of the olden and long-vanished years of the past.

The columns of FOREST AND STREAM have lately contained numerous allusions to the fact that the different gun manufacturers are each trying to bring out a single-triggered double-barreled shotgun, and some of the articles have tacitly hinted that such a thing is a matter of difficulty, and requires much study and careful thought in order to succeed.

When I saw the first of these allusions I smiled to myself; when I saw another I laughed; and as they grew more numerous I wondered where the difficulty lay, and even went so far as to call my boy's attention to the matter, and to tell him that I had seen and shot such a gun nearly thirty years ago, and that it had done good work, but that I had seen but the one.

I heard of that gun in the winter of 1859-60, but I didn't see it until in the spring of 1869. My uncle lived in Missouri, and came in to Pennsylvania in the winter named to see his parents—my grand-parents—who were growing old, and I remember of hearing him tell his father of his gun, and that he had rigged it up so that it had but a single trigger. Grandfather had been a mighty hunter in his day, and took great interest in all that related to sport and to sporting materials, and I can remember how interested he seemed in the one-triggered gun that uncle told him of.

In '69 I went out to Missouri to visit my uncle. I inquired about his gun. He brought it out and showed it to me, and told me that he had got it up himself; that the trigger was a broad one inside the locks of the gun. I afterward took off the locks and examined the mechanism. The trigger was in the slot that had originally held the trigger for the right lock, the sear-spring of the right lock was much weaker than that of the left, and he told me that he had made it so on purpose; the slot that had held the left trigger he had filled up with a piece of steel inserted while the trigger plate had been hot, and then filed down in a workmanlike manner. On the left side of this single trigger was a plate making the trigger broad enough to reach and raise the sear of the left lock of the gun. In firing, the trigger first raised the right sear, and thus the right barrel of the gun was discharged. If the pull was continued the right sear was still further raised, and the plate above mentioned coming in contact with the left sear raised it and discharged the left barrel of the gun. The trigger pull of this gun, I should say, was for the right barrel about 3lbs., and for the left barrel did not exceed 4lbs.

Of course the gun was a muzzleloader, but the barrels were fine Damascus, and it was a great shooter. Uncle told me that he had paid \$75 for it in St. Louis. I asked him why he had changed it, and he said that he didn't like the two triggers; that they had sometimes fooled him, and that when he bought the gun he had tried to have the dealer change it to a single-triggered gun, but had been told that it could not be done, or that if it could that it would not give satisfaction. He had come home, taken a piece of steel, and after annealing it had made the trigger as I saw it with a file and a small drill. That he then had taken the sear springs out of the locks and had adjusted them so that the trigger pull suited him, had placed all in position, and had never had any further trouble with the gun, except that he had taken it apart and oiled it whenever there seemed to be need for it. He had killed much game and many deer with this gun, and every one of his neighbors knew or knew of his gun. I have often fired it, but did not like the single trigger. Both barrels could be discharged very nearly together, but there was a perceptible difference in the trigger pull of the two barrels, and I think such must always be the case.

I have not seen any of the recent productions of single-triggered double guns that have come out of the manufacturing, but I think that the same objections that existed to uncle's gun may be found in them. A single trigger, however, is a step in advance; whatever lessens the number of motions requisite for the handling of a gun, as a gun, necessarily adds to the efficiency and ease of use of the weapon. AMATEUR.

The Ohio Ducking Law.

From the Cleveland Leader.

In another column we republish an article which appeared in the Leader of Sept. 13, 1896, giving a history of the restrictions placed upon shooting ducks and wildfowl on Monday and Tuesday of each week. The restrictions as to these days should be repealed.

It is decidedly unfair to prohibit shooting wildfowl on Mondays and Tuesdays on the marshes contiguous to Lake Erie (if they should happen to be little bays and estuaries) and not in like manner prohibit shooting wildfowl on marshes which are not estuaries of the lake or upon other parts of the State. Almost all sportsmen who have expressed their views upon this subject for the past ten years, since the restriction was first introduced into the game laws of Ohio, maintain that the limitation, if enforced, would not aid in protecting game. It is claimed that bunching the shooting into the last four days of the week leads to more destruction of game and careless shooting than if hunting were allowed on the six days of the week. And the law has not been enforced and cannot be. In the opinion of many the better way would be to shorten the open season and omit all restrictions as to week days. If wildfowl need further protection, make the open season commence Sept. 15 instead of Sept. 1, as now. But the injustice of the present condition must be apparent to all members of the Legislature. Some of the Lake Erie marshes are bays and estuaries, others are not; and as the law stands the members of one club can hunt and at least shoot at ducks six days in the week, while others within a short distance cannot do so on Mondays and Tuesdays. In addition, it is a constant menace to honest sportsmen who will try to obey it, while some will ignore it entirely, knowing that the game wardens cannot enforce it. Any attempt to prevent the shooting of ducks on Mondays and Tuesdays and permit the shooting of other marsh game on such days is absurd. To make such a law effective as to wild ducks the restriction should also apply to all wading and swimming birds, such as coot, rail, snipe, plover, etc. But the idea is absurd, and all restrictions as to Mondays and Tuesdays should be eliminated from the game law.

From the Leader, Sept. 13, 1896.

One of the most trying subjects for the average legislator to understand seems to be the proper protection of game and fish. Other States have the same trouble in this matter that has existed in Ohio, for the incongruities of almost all of the game laws of the various States are notorious. But the experience of the Ohio Legislature in trying to prohibit the hunting of ducks and wildfowl on Mondays and Tuesdays of each week so as to strengthen the law against Sunday shooting is ridiculous in the extreme.

In March, 1887, the Legislature passed a game law which made an attempt of this kind for the first time, and it was published correctly in the book of laws for that year. For several years previous the farmers living in the neighborhood of St. Mary's reservoir and other inland lakes had been greatly annoyed by the hunters from the cities flocking to these places to shoot ducks and other game on Sunday. When on these trips a great many depredations were committed. The Legislature was finally appealed to, and in March, 1887, passed a game law which provided for the seasons in which game should be killed, and after prohibiting the destruction of nests and eggs of game birds and wildfowl the following complete sentence was added:

Excepting in the waters of Lake Erie and the estuaries and bays thereof, no person shall, in any place, catch, kill or injure, or pursue with such intent, any blue-winged teal, mallard, wood duck, or any other duck, on Sunday, Monday or Tuesday of any week, between the 1st day of September and the 1st day of April of any year.

The prohibition of Sunday shooting was thus made a part of the game laws of Ohio, and in order to aid in its enforcement the hunting of ducks and wildfowl was also prohibited on Mondays and Tuesdays of each week excepting in Lake Erie and the contiguous marshes, the latter being owned largely by clubs which do not hunt on Sunday.

At the legislative session of 1888 some member of the Legislature had another amendment to make to the game law, and as is usual in such cases cut out the old law, and after putting in his amendment or addition had it printed and passed. The printer, however, made a mistake, and the words "excepting in the waters of Lake Erie and the bays and estuaries thereof" were added to the clause prohibiting the destruction of eggs or nests of ducks and wildfowl, the law appearing as follows:

No person shall destroy or disturb the eggs or nests of any birds named in this section, excepting in the waters of Lake Erie and the estuaries and bays thereof; no person shall in any place catch or kill or injure or pursue with such intent any wild ducks on Sunday, Monday or Tuesday of any week between the 1st day of September and the 15th day of December of any year.

In effect then it was unlawful to destroy the eggs and nests of any ducks or game birds excepting on Lake Erie and contiguous marshes. This gave the people of Toledo and other small towns in the marshy district an unfair advantage, or it was a reflection upon their methods of supplying material for their omelette. The members of the Legislature and the clerks of that body from 1888 to 1894 ought to have found out that the laying and nesting season with wildfowl is in the spring and not the fall. The Leader frequently called attention to this blunder, but no attention was paid to it, and the law in its bungled form appears in the revised statutes for 1890. In 1894 some member of the Legislature had an amendment to make in the game laws,

and after adding his amendmert had it again passed without, however, correcting the blunder made in 1888. So that up to 1896 any evil-disposed person on Lake Erie could destroy game birds, nests and eggs with impunity if he so desired. But all sportsmen throughout the State knew what the law was intended to mean, and we believe it was fairly observed. Those living on the shores of Lake Erie and the members of contiguous clubs continued to hunt on Mondays and Tuesdays as before, as there had never been any objection to it.

During the last session of the Legislature (spring of 1896), however, some new member saw a point in the game law that he thought needed amending. After making the desired amendment he came across the peculiar combination of blunders dating back as far as 1888. He was an intelligent and well-meaning man, and saw that it was not exactly proper or fair to permit residents on the shores of Lake Erie to destroy eggs and nests of ducks and wildfowl without permitting other residents of the State to do the same. He did not, however, examine the history of the affair far enough back to see that the clause "excepting Lake Erie and its bays and estuaries" was inserted in the law so as to permit hunting on Mondays and Tuesdays in that locality, while the intention was to prohibit such hunting in other parts of the State. He therefore rewrote a part of the section, and after the usual prohibition regarding the destruction of eggs and nests the new law says:

"No person shall kill any wild ducks on Sunday, Monday or Tuesday of any week on any of the reservoirs belonging to the State of Ohio or in or upon the waters of Lake Erie and the estuaries and bays thereof."

As the law reads now it is unlawful to hunt on Mondays or Tuesdays on the reservoirs of the State or upon Lake Erie and adjacent marshes if they are considered estuaries of Lake Erie, but nothing is said about other parts of the State, or of marshes on the shores of Lake Erie which are not bays or estuaries of the lake. In reality therefore as great a blunder is made by this new law as was made in 1888, because the inland lakes, rivers and creeks needed this restriction. In all probability the Legislature intended to only correct the blunder in punctuation in the old law and restore the part relating to Monday and Tuesday hunting as it was in 1887, and it is likely that residents and members of clubs along Lake Erie marshes will continue to hunt on those days as usual. It is very singular, however, that some one cannot be found in our Legislatures who can frame an intelligent and just game law.

A Friendly Deer.

DR. WILLETT KIDD, the fish and game protector, visited Cooley, a small hamlet in Sullivan county, on Saturday at the request of a man named Melvin Carley, who had a wild deer confined in his barn, and was uncertain as to what disposition to make of the animal.

On Wednesday evening, Feb. 2, while Mr. A. G. Welsh, a resident of Cooley, was eating his supper, a large deer bounded into the dooryard. The surprised farmer hurried to the door to get a better view when the deer stepped up on the stoop and tried to enter the house. Mr. Welsh closed the door on the unexpected visitor, and the deer, having made unsuccessful efforts to get in, looked into the window at Mr. Welsh as if seeking protection. Mr. Welsh had no particular use for the pretty creature, and it finally departed. The deer was breathing hard and was very tired, apparently it had been chased a long distance.

Not having found friends at Mr. Welsh's home, the deer continued her journey, and next called at the home of Mr. Carley who lives near the first named. At Mr. Carley's house the fugitive made her presence known in a somewhat startling manner. Mr. Carley was within, when he heard a slight noise at the window. Glancing up, he saw the deer looking longingly inside. Mr. Carley took compassion on the gentle, soft-eyed creature, and easily got it to follow him to the barn, where he locked it up. The deer had been run nearly to death by lawless hunters, and had also been shot in the back near the spine. The wound slightly affected its traveling.

Having rescued the animal from butchers, Mr. Carley was at a loss to know what to do with it, as it is a violation of the game laws to have deer in the possession. On the other hand, if he turned the deer away it would fall an easy prey to some conscienceless pot-hunter. Therefore Mr. Carley took the wisest course and notified Dr. Kidd.

The game protector and Mr. Carley went down to the barn, and when the door was opened the prisoner, a large and handsome doe, bounded down to meet them. Mr. Carley had made a great pet of the animal, and directly it began to sniff around in the pockets of Dr. Kidd's overcoat for apples, of which it is very fond. Dr. Kidd examined the wound in the back and found that it had probably been made with buckshot. There was another hurt in the leg, which looked like a gunshot wound, but which might have been made by a wire fence barb. The deer was sleek and fat and was rapidly recovering from its wounds. Mr. Carley is a good-hearted man, and had given his pet plenty to eat, and had cared for its injuries.

The tameness of the animal is surprising, for it is without doubt a wild deer. However, instances have been known where wild deer which have been wounded and chased nearly to death by dogs and cold-blooded hunters have sought human beings for protection. A while ago the Sun gave an instance where a tired fawn had dashed into a little town in Maine and put itself in care of a lad, who led it safely to his home.

Under the circumstances, it seemed best to allow Mr. Carley to keep his pet, and when the game protector gave such a decision Mr. Carley was well pleased. The people for miles around come to see the pretty prisoner, for while the residents of that particular community see many dead deer brought in by hunters they have about as few chances to see live ones as do Newburghers.

Many residents in and about Cooley conduct boarding houses during the summer, and there is probably not one of them but would gladly give \$100 for the pet, as it would be a rare attraction for the city folk who spend the warm months in rugged Sullivan. No amount of money, however, could buy that particular deer. It is significant too that Mr. Carley has put a strong lock on his barn door.—*Newburgh Journal, Feb. 14.*

Sea and River Fishing.

The Triton Club.

The accompanying illustrations are of the Triton Fish and Game Club, in the Province of Quebec. They show the club house and view down Lac a la Croix from the house. The Triton preserve is twenty-four hours from New York. Leaving Quebec by the Quebec and Lake St. John R. R., we begin to climb up toward the mountains, passing through the quaint little Indian village of Lorette, where the last remnants of the once powerful tribe of Hurons live on the reservation provided by the Government of Canada, and it is from here we procure our guides for the Triton Club; and good, honest, hardworking, painstaking guides they are.

After a ride of five hours through a wild, mountainous country, with a view from the car windows every few minutes, as we pass along, of some little lake nestled in among the mountains, we finally run along up the Batiscan River for forty miles. The Batiscan is a wild, rushing river, winding in and out of the mountains until it seems we must get lost even if we are on a railroad.

At a distance of 108 miles from Quebec the train comes to a stop, and we find ourselves at our journey's end, so far as the iron horse will take us. There we come to a beautiful little chalet built of logs, with the sign "Triton Fish and Game Club" across the front of it. This is the depot, and belongs to the club, having been built by the club, and on their own land. The cottage consists of a large room with fireplace, chairs, and two bedrooms and other furnishings, with a guide house attached. A telephone connects with the club house, and a man with boats and men meets all trains. There are no other houses at the station, and the train only stops for those going to the club.

From the station down the Vermillion River and into Lac a la Croix, where the club house is situated, is a trip of a half hour only; and here, as one may readily see from the accompanying cuts, members have a beautiful summer home. The house contains a large hall, reading room and thirty bedrooms. Near by are a boat house, large enough to contain 100 canoes; guides' house, ice house, and a garden of four acres.

All this in the midst of the Laurentian Mountains, 1,700 feet above tide water. These mountains, geologists tell us, are the oldest mountains in the world.

The club tract contains some 800 square miles, and is a virgin forest, not a stick of timber having ever been cut upon it. The tract contains over 100 known lakes, only about one-third of which have ever been explored except by Indians. The largest known lakes are Troix, Carabou, Lac de Passe, Mouise and Batiscan; and they are from five to thirteen miles long. Only brook trout (*Salmo fontinalis*) are found in the tract, and every lake and stream is full of them. The largest fish caught since the territory has been formed into a club was caught last summer by Hon. William B. Kirk, ex-Mayor of Syracuse, and weighed 9lbs. But before the club was organized, in 1894, trout had been caught weighing over 10lbs.

Since the organization of the club a few of the large catches of fish have been:

Dean Robbins, of All Saints' Cathedral, Albany, 12 fish weighing 72lbs., the two largest weighing 8¼ and 8½.

Charles H. Mowry, editor Sporting Goods Gazette, Syracuse, 33 trout weighing 110¼lbs.; average 3lbs. 5oz. each, the largest 6½lbs.

A. N. Cheney, New York State Fishculturst, 35 trout weighing 117½lbs.; the largest, 7lbs.

The Triton abounds in game—partridge, duck, caribou, moose and bear—and in fur-bearing animals there are muskrats, mink, otters and beavers.

The daughter of Hon. Charles Andrews, Chief Judge of the Court of Appeals of the State of New York, killed two caribou last year, and as she expressed it, could have killed twenty more.

Commenting upon the election of Mr. G. F. Gregory, of Syracuse, as president of the Triton Club for 1898, the courier, of that city, says:

"The election of G. Fred Gregory, of Syracuse, as president of the famous Triton Fish and Game Club, of the Province of Quebec, serves to call attention to this unique organization, in which Syracusans play a most important part. Mr. Gregory has been a member of the club since 1895, and ever since he joined the association he has labored with energy and enthusiasm to promote its interests and to advance its prosperity. A true sportsman and a lover of nature, Mr. Gregory takes delight in exploring the Canadian lakes and wilderness, while his sportsman's instincts are stimulated and more than gratified by the success which attends the efforts of himself and fellow-members of the Triton Club to woo the unequaled brook trout from their native element. Largely through Mr. Gregory's efforts the membership of the Triton Fish and Game Club has been made to include a large number of prominent Syracusans who spend from two to six weeks each summer in hunting or fishing or in enjoying outdoor life."

The home of the Triton Club is located on the preserve situated within the deep recesses of the Laurentian Mountains, in the Province of Quebec, and is an ideal resort for those who desire to get as far as possible from the haunts of man in their search for rest, recreation and enjoyment. Geologists say that these mountains are the oldest in the world, but whether this be true or not, there is no doubt that the trees that cover them are a virgin forest which has never been cut or interfered with by the hand of man. Here one may find conditions which have existed undisturbed perhaps since the flood, and no more interesting or attractive locality exists on the American continent, at least to those who enjoy outdoor sports and exhilarating recreation hundreds of miles from the haunts of man. The Triton Club house is easily reached from Syracuse in twenty-seven hours in a sleeping or parlor car. Having reached this comfortable club house, members can remain there if they so desire, for there is good fishing at its very doors. And the scenery is wild, beautiful and deeply impressive. The club preserve contains 800

square miles, so it will at once be seen that there is no chance that the quarters will ever be crowded, and there is plenty of opportunity for the members to "spread out" and become explorers in a region never trodden save by the foot of the Indian.

From the club house there is a choice of five or six different routes leading into the deep recesses of the virgin forest. Supplies, such as tents, canoes and provisions and camp outfits, are obtained at the club house, and with their Indian guides as pioneers the Syracuse members of the Triton Club strike out from the club house for a twenty-five or more miles' tramp and exploring tour through regions as primitive in their char-

THE TRITON CLUB HOUSE.

acter as the mind of man could imagine or conceive of. After a long day's tramp and carry, the camp is struck at night, and the tired fishermen and hunters, after partaking of a hearty supper prepared by the Indian guides, who are the best of chefs, stretch themselves upon the ground and enjoy a sound night's sleep and rest. Every lake and stream teems with brook trout, and remarkable catches are constantly reported during the fishing season.

Mr. Cheney states that in all his life he had never found fishing to approach that in the Triton Club preserve. Surely the true sportsman could wish for no higher gratification of his sporting proclivities than may be obtained in this favorite spot. But it is not fishing alone that lures Syracusans to the Triton grounds. Hunting is not the least of the pastimes afforded, and the game is royal game at that. Caribou, moose, bear, partridge and duck are to be found in abundance, and such fur-bearing animals as the beaver, otter, mink and muskrat.

Syracusans have enjoyed the royal sport of bringing down a caribou. Among those favored in this respect were Mrs. William S. Andress, an enthusiastic hunter;

THE CLUB HOUSE FROM THE LAKE.

Douglass E. Petit, Morris A. Smart, Charles Mowry, John Moore and others. No more exciting and exhilarating sport could be imagined than the successful chase after these royal denizens of the primitive forest. Surely the true sportsman could desire nothing more than a season of enjoyment in the wide-reaching preserves of the Triton Club among the recesses of the Laurentian Mountains. Summer or vacation life in this famed resort is wild, but free, and untrammelled by the customs and rules of everyday existence. Here a man may "rough it" in the pure air of the mountains, enjoy camp life with a good bed and an abundance of good food, follow the bent of his inclination to hunt or fish, and gain health, while pursuing sport to a degree never before experienced, and such which cannot be experienced under like conditions in any other spot on the American continent.

New England Sportsmen's Exposition.

BOSTON, Feb. 21.—Secretary Walter L. Hill, of the New England Sportsmen's Association, says that features of the exhibit in March are already arriving. There are to be several live moose—one report says seven, but Mr. Hill is not sure of so many. Two caribou are already at hand; also a silver-gray fox. A Canada lynx is assured, and two black bears are on the way. California and Southern quail are to be shown, as well as numerous other game features. All these creatures will be there and alive. There is to be no faking. Fakirs and outside issues are not to be tolerated. Men of means as well as lovers of outdoor sports have taken hold of the affair for the sole purpose of making a genuine sportsmen's exhibit. SPECIAL.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Proverbs of Angling.

Compiled by Shaganoss.

1. "The hand that rocks the cradle rules the world." Perhaps that is so, but most men had rather go fishing than rock cradles.

2. "Speak gently of the erring."

That is wise, especially if the "erring" party is bigger than you are. He may pitch you out of the boat.

3. "Nemo bis punitur eodem delicto."

This means, when fishing, don't lick yourself twice for the same mistake. Once is enough.

4. "There's many a slip 'twixt the hook and the landing net."

An excellent toast, should be drunk in silence, with the gas turned down low, and at the end of the feast.

5. "Nihil tetigit quod non ornavit."

This means that he always spit on the bait.

6. "Necessity knows no law."

When you get a hook in your finger, get it out the best way you can.

7. "Errare est humanum."

Yes, especially when fishing; and the worst of it is that the errors are always in favor of the fish.

8. "De gustibus non est disputandum."

If an angler chooses to carry his worms in his mouth, it is nobody's business but his own.

Still this is a practice which I cannot recommend. Ladies are liable to object to it sometimes.

9. "A fish in the landing net is worth sixteen in the water"

—especially if it is a big one.

10. "Let me carry the bait bottle and I care not who pulls the oars."

11. "Caveat emptor."

This is an old Latin phrase, which means that when a man, returning at night with an empty creel, stops and buys his fish at the market house, it is a good plan to cut fish-hook holes in their jaws before he shows them to his wife.

12. "De minnowis lex non curat."

This means that stealing minnows is not a crime known to the law.

13. "Thy friend and thy father's friend forsake not"

—except when the fish bite, and then give them "the grand shake."

14. "One fish lie, well stuck to, is better than a wheelbarrow load of cold facts."

15. "He that taketh a fish is better than he that ruleth a nation."

16. "Dulce est desipere in loco."

When you want to make a fool of yourself, it is a good plan to see that nobody is around.

17. "A man is known by the company he keeps."

Some men are; others are known by the fishing yarns they tell.

18. "Keep thy bait with all diligence, for out of it are the issues of the trip."

19. "Dum vivimus, vivamus."

When you are fishing, fish. Don't waste any time swapping jack-knives.

20. "Dulce et decorum est mendacium dicere."

Marc Anthony one day unloaded some of his fishing yarns upon Mrs. Cleopatra. The above terse remark constituted her reply. She evidently knew Marc thoroughly.

21. "Time and tide wait for no man."

I never knew them to—at least, not since the time of Joshua, B. C. 1451. But this is too old a case to be relied on as a precedent.

22. "Too much of a good thing"

—is unknown in fishing. Don Quixote hit the nail squarely on the head when he remarked: "That which is good is never superfluous."

23. "Ex nihilo nihil fit."

Which means that the man who tries to catch fish without bait is tolerably sure to get left.

24. "Piscator nascitur, non fit."

This is a fact, and it doesn't make any difference who his parents are, either.

25. "Whatsoever thy hand findeth to do, do it with thy might."

This was Solomon's way of saying that a fishing party is no place for mugwumps, kickers or drones. "Fish, cut bait or go ashore" was the rule then, as now.

26. "The lame and the lazy are always provided for."

This isn't true, though, for reasons strictly personal to myself, I wish it was.

27. "In hoc signo vinces."

Make sure that you have good bait before you start out.

28. "Concensus facit legem."

Freely translated, this means that when the other fellows lie about their scores, it isn't worth your while to stick to the truth.

29. "*Magna est veritas et prevalebit.*"

The man who got this up never went fishing—or, if he did, he intended it for what Artemus Ward used to call "sarcassum."

30. "*The exception proves the rule.*"

There are no rules in fishing. They are all exceptions.

31. "*Verbum sat sapientibus.*"

Don't follow the advice of anybody, unless he knows more than you do.

32. "*Honi soît qui nial y pense.*"

The old tradition that this phrase arose in connection with somebody picking up a woman's garter is pure fiction. It is a fisherman's motto, and means that simply because a man has had bad luck, and comes home at night with an empty creel, it is hardly proper for him, on that account, to kick his wife, cuff the children, stone the dog and throw the cat down the well.

33. "*Ignorantia legis neminem excusat.*"

If a fish gets off on a slack line, you will have nobody to blame but yourself.

34. "*Facilis est decensus averni.*"

Freely translated, this means that it is a bad practice to swear at a fish that gets off. It don't hurt the fish a bit, and it may affect your moral standing in the remote future. Don't do it.

35. "*Economize on the necessities of life rather than on the luxuries.*"

It is easier to worry along on second-class beefsteak than with poor bait.

36. "*It is not possible for anybody to know everything.*"

Some people think they do just the same.

37. "*In aqua, veritas.*"

I wish this was true, but it isn't.

38. "*Veni, Vidi, Vici.*"

When a fish is hooked, get him in as soon as possible.

39. "*Non multa sed multum.*"

When fishing, I prefer both.

40. "*Homo sum; humani nihil a me alienum puto.*"

The author of this old proverb lacked what Rufus Choate once called "felicity of expression." Being asked one day what kind of fishing he preferred, he replied as above. What he meant was this: That all kinds of fishing were good—that any of them "would go" with him. While he expressed himself somewhat awkwardly, his meaning is clear.

41. "*Forsan et haec olim meminisse juvabit.*"

A steady rain during your entire outing, especially if you are living in a tent away outside of civilization, may be a pleasant thing to recall about twenty-five or thirty years hence.

42. "*Eternal vigilance is the price of success.*"

Just remember this the next time a fish steals the bait off your hook while you are thinking about the girl you left behind.

43. "*Falsus in uno, falsus in omnibus.*"

Evidently this means that a man who would lie about his fish-score wasn't to be believed on any other subject, even under oath. Not a bad sort of a rule, either.

44. "*Tempora mutantur.*"

The fishing is not as good as it used to be. Sad, isn't it?

45. "*Sic transit gloria mundi.*"

Freely translated, this means that when a man deeply in love goes fishing, he needs to look out that some other fellow does not run off with his best girl before he gets back.

46. "*Ab uno disce omnes.*"

This is a lie—a pure, unadulterated water-proof lie. One fish caught, and weighed, cannot be relied upon to prove the weight of the next fish which the hook will bring up.

47. "*Carpe diem.*"

Go fishing every chance that offers—an excellent rule even yet.

48. "*Prior tempore, prior jure.*"

The first man to hook a fish has the best claim to it. This is not much of a proverb, but it will "go."

49. "*Apparent rari nantes in gurgite vasto.*"

This was a very awkward way of saying that the fish were "few and far between," and "not many of them," either.

50. "*Prove all things; hold fast that which is good.*"

Better: Prove all things; hold fast everything which gets on the hook.

51. "*Noli me tangere.*"

That is what the worm said to the fish; but it didn't stop the funeral.

52. "*The end justifies the means.*"

If, at the end of a fishing trip, you haven't enough fish to show well in a photograph, the photographer will ordinarily supply you with enough stuffed and painted "dummies" to make a good showing. Borrow and put in as many of these as your conscience—if you have one—will stand.

53. "*Misfortunes never come singly, but in battalions.*"

I get them both ways.

54. "*Mistakes occur in the best regulated families.*"

Yes, but that fact does not help you a particle, when you suddenly discover that you have left your favorite rod six miles back, at the other end of the last portage.

Fishing on Forbidden Waters.

EMPTYING into the Delaware River, up in New York State, is one of many noted trout streams. Starting high up, and miles back in the woods, amidst rocks and bogs, it meanders its tortuous way, gathering up the outpourings of numberless springs en route, and finally reaches the river a grown-up stream of some importance.

Fresh, cool and sparkling from the woods, it crosses the main street of the village, under the old wooden bridge, and then flows through a meadow for half a mile just before it tumbles into the swift-flowing waters of the Delaware.

This half mile of meadow was fenced in, and was part of a farm owned by a crabbed, testy old farmer, McShane by name, notorious throughout the county for his sharp and oftentimes very questionable trading.

Paving stones had been found in his baled hay; his milk sent to town had been watered; he had killed diseased cattle and sent their meat to market, and a number of other similar transactions had been brought home to his door.

Although he had never caught a trout in his life and was never known to ask a neighbor to his farm to enjoy an hour's trouting, it was nevertheless a source of delight with him to know that he had on his land the best half mile of brook trout fishing, perhaps, to be found in the State.

He had reason to know that there was not a man or boy in the village, fond of fishing, but who would make almost any sacrifice, were it possible to get an afternoon's fishing in that stretch of water.

It did his covetous old eyes good to see the boys and men stop at the fence and gaze with longing eyes on that water, which at times was fairly alive with jumping trout. Fishermen would start fishing well up the stream and work down toward the river, only to finally come up against the fence, crossing the stream just when the fishing gave promise of being the best, and to read the conspicuously posted sign: "No fishing allowed. Trespassers will be vigorously prosecuted. Keep off."

The reputation of McShane for temper was not of the best, so much so that he was credited with a disposition to run one through with a hay-fork or perhaps slash you with his scythe, and accordingly the boys had great respect for that signboard—and incidentally for McShane as well.

There was a tradition that in former days McShane had almost killed a trespassing fisherman, and not even the boldest who might venture over the fence and cast his line into the forbidden precincts—with one eye always on the farmyard and the other on the water—was brave enough to stand his ground when the lank, cow-hide-booted, jean-appareled, straw-hat-crested form of McShane loomed up in the distance, fork, spade or scythe in hand, shouting the stereotyped cry of: "Gol darn ye! Git off'n there quick, or I'll break every bone in yer body!"

The stream, as well as the river, was fished "hard" in the spring, but this half mile of water was left in peace and quiet, as it were, a wild and natural preserve. It was a self-selected spot haunted by both big and little trout, the small fish coming from up the stream and hugging the shallow places, and the large fellows, great lusty fish of 2 and 3 lbs. in weight, coming from the river and crowding into the pools.

In May, when the flies were stirring, one standing at the fence could witness the leaping trout as they struck the falling flies when they touched the water. The fish were there in hundreds, and the surface of the water never seemed free from ripples made by rising fish. During the night the trout undoubtedly made excursions up the brook and out into the river, but when daylight came they found their way back to their haven of refuge, where worms on hooks, rainbow-tinted flies, swishing rods and wading men were unknown.

If the stories told from day to day by enthusiastic and imaginative anglers were so, as to the jumping trout seen in that stream, rolb. fish would have been at a discount. Because they were forbidden fish they seemed so much the larger.

Nothing but pure cussedness and meanness seemed to be the motive for posting that stream. The meadow along the waterway was rocky and swampy almost the entire length, so that no possible damage could result from one fishing the stream, even from the banks, in the way of trampled crops and meadow.

And as season after season went by, the trout in that sanctuary waxed lusty and strong and became numerous beyond count.

One of the village boys, who had been to New York studying to become a lawyer, returned one spring to his country home a full-fledged attorney-at-law, and without delay secured an office over the village post-office, and his shingle, bright and glorious in luminous paint, was exposed to the gaze of the villagers.

The many weary months he was cooped up between bricks and mortar in the great and noisy city, during which he wended his laborious way through the dry and dusty paths of legal lore, were not forgotten, and now that restraint was off and he was again among the hills and streams of his boyhood days, his intention was to enjoy them as the opportunity presented.

He had spent many Saturdays as a boy along the brooks, luring the trout with worm and alder pole from the cool recesses of the shelving rocks and overhanging banks. Often had he, after a day of indifferent fishing, stood at the forbidden fence and watched the trout jump when his string was far from filled.

His study of the law had convinced him of the power of speech, and he had assiduously cultivated that faculty. Being small of stature, he made up, therefore, in tongue what he lacked in physique.

He had set his mind on fishing in that sanctum sanctorum of old McShane's. If sued for trespass he would defend his own case, and if beaten, pay the damages—probably six cents. As to physical violence, he would rely upon his tongue to protect himself from that.

He was out with pole and bait before daylight, and

started in to fish, well up the stream, and work down toward the village. Luck was fair and the sport delightful after his long enforced abstinence. As the day wore on he neared the forbidden ground. He planned to reach the spot about 6 o'clock and watch for McShane until he went to supper, and then start in, thinking thus to improve his chances of a longer undisturbed fish.

Watching the farmer enter his house, he crawled under the fence and made for the pool on his hands and knees where he had seen the big fellows jump, and selecting an open spot, free from rocks and bushes, so that when lying down he could handle his rod fairly, he cast his line into the stream, and the fun began from the first cast.

It was hard work, prone on his stomach, handling those big fellows, but he was fishing with an alder pole and a stout hook and line, so that the trout had it not all their own way, as if up against a willowy 50z. rod.

Fish after fish, fine, plump, heavy fellows, did he add to his string, and still the war cry of old McShane sounded not in the distance.

Gee whiz! but the sport was great! Splash went his grasshopper upon the water again, and this time the line tugged as it never tugged before. He had the daddy of the pool, for as the fish turned in the water after taking the bait, his massive head and shoulders were a sight to see. A 5-pounder sure! He was fishing without a reel, and unless carefully handled the fish would tear loose from the hook and be off. Nothing must prevent him saving that fish, come what might, so up he stood, straight upright on his feet.

Instantly from the distant precincts of the farmhouse window came the well-known and old-time familiar cry ordering him off and consigning his body and soul to Sheol and all the side stations on the map. But our fisherman heeded not; his eyes and thoughts were on that fish and nowhere else. It made no difference to him that the sound of McShane's profanity advanced nearer and nearer, he must land that trout. After a few more sweeps of his pole he had the trout on its side and slowly drew it toward the bank, when stepping into the water and getting his fingers under its gills he drew the dripping beautiful fish from the water just as McShane, scythe in hand, came up panting, breathless and white with rage.

Our fisherman was cool and not at all disturbed even at the hostile demonstrations of McShane, who held the scythe drawn back as if prepared to mow off a foot or two of the trespasser's legs, and as McShane drew breath the fisherman calmly but firmly remarked, "Be c-a-r-e-f-u-l, for I'm a lawyer."

Only recently McShane had been hauled into court on a flagrant milk-watering transgression, and the recollection of the various things in a pecuniary way done to him, not only by the prosecuting lawyer, but by his own attorney as well, flashed across his parsimonious mind. The lawyers had been to him as a buzz saw.

Dropping his scythe, he exclaimed: "Be you a lawyer, well, I want to know!" After a little further palaver McShane invited the lawyer to "set you down," and then and there began to question him on the law of trespass, and assault and battery. It was the chance of McShane's life to get some cheap legal advice, and he embraced the opportunity.

The farmer listened to a very learned dissertation on the law, liberally sprinkled with Latin sentences, but boiled down at the last McShane learned that for trespass he might secure six cents damages, and as for jabbing a man through and through with a fork, or slicing off one's legs with a scythe, criminal or civil proceedings would result and end in either imprisonment or a matter of a few thousand dollars damages. It was now about dark and they wended their way to the barnyard, and our lawyer friend stepped out upon the high road on his way home the happiest fisherman in three States.

In the memory of the oldest inhabitant no such catch of trout had come into the village.

Selecting the largest fish, they were displayed on a block of ice in the principal shop window of the village, and were universally admired.

Callers trudged up his office stairs all day, congratulating him upon his phenomenal luck, and if asked once he was asked a hundred times "Where did you get them?"

Within a week the lawyer made out the following bill:

John McShane, Esq., Dr.	
To John Countryman, Attorney at Law:	
Consultation had and advice given as to law of trespass	
and assault and battery.....	\$25.00

and depositing the bill in the mail duly addressed awaited results. And the results came good and fast in the person of the old skinflint, foaming at the mouth and beside himself with rage. He stormed; he swore; he yelled that it was a swindle, an outrage. He bellowed like a yearling bull.

Countryman was on his own dung hill, so to speak, so McShane had to dance to another man's music. The lawyer made but one reply—that bill must be paid. And McShane left, threatening to run the lawyer out of town and do other dire and dreadful things.

In another week the village combination of constable, sheriff, pound-master, etc., served the farmer with papers in the suit of Countryman vs. McShane, and when it came to trial McShane would hire no lawyer; he would conduct his own case. In selecting the jury Countryman took care to see that every juror was personally acquainted with the defendant. Of course a verdict for the full amount was given for the plaintiff—some of the jury asking the justice if there was any law against making the verdict for \$100, at which McShane almost collapsed.

Nothing was left now but for McShane to haul out his safety-deposit-vault stocking and pay up or have a cow or two seized to satisfy the judgment.

Outside of the fun created at the trial, Countryman had gotten unlimited advertising out of the case. Every farmer in the country for miles around had driven in to witness the trial. The number of teams tied up around town made one think of fair day.

Countryman sent for McShane and agreed to let up on him under one condition, and that was that he should permit free fishing on the stream in future, and McShane signing a paper to that effect the judgment and costs were waived.

The stream at once became open fishing, and as a

consequence the trout scattered, and that particular stretch of water afforded no better fishing than the rest of the stream.

Countryman's reputation as a lawyer was made in those parts, and every one said that any one who could "come up" with that rascalion of a miserly, domineering old McShane in any such way deserved credit, success and all the consequent good things in this life usually hankered after by man.

CHARLES CRISTADORO.

The World's Seal Fisheries.

BY C. H. TOWNSEND.

[Read before the Fisheries Congress at Tampa, Fla.]

IN wasting our resources we not only lose the supply of food or useful articles derived from them, but we break up the organized industries by which means our products are preserved and distributed. When we permit the destruction of a fishery it means, therefore, that we not only do without the products of that fishery, but we injure the vessel builders, manufacturers of apparatus, transporters, dealers, and the whole line of persons directly or indirectly connected with it. Civilization needs every source of supply and every commercial industry it can get. The history of the world's seal fisheries is one of wasted resources. Commercially seals are the most important of carnivorous animals. They are of world-wide distribution. Their pursuit has been carried on in the Antarctic regions almost as extensively as in the Arctic. The fisheries of the Antarctic are now exhausted.

Although we have, during the past ten years, been hearing a great deal about the fur seal fisheries, they are not the only seal fisheries of importance.

The Newfoundland seal fishery is one about 100 years old. It is prosecuted with a large number of men and a great number of vessels. It appears to have reached its height about thirty or forty years ago, when there were about 400 sailing vessels employed and some 13,000 men. Since that time the catch of seals has decreased and has varied greatly from year to year. The annual value of the fishery now is not more than \$600,000. The sailing vessels have been replaced by steamers, whose numbers have decreased to about twenty, employing about 4,000 or 5,000 men. This fishery is based on the Greenland seal, or harp seal, which has a very wide distribution, and is probably the most abundant of any seal species. It lives upon the drifting Arctic ice, and occurs from Newfoundland to the head of Baffin's Bay, and from Greenland all the way across to the perpetual ice fields lying to the north of Europe. The greatest number of seals taken in any one year was in 1844, when the number reached nearly 700,000. During recent years the catch has varied from 130,000 to nearly 400,000. The catch in 1896 was 187,000. The vessels now employed are steamers of large size, some of them 500 tons burden. The method of taking the seals is to find their breeding places on the drifting ice, when the crews of the vessels land and club the younger seals, which do not take to the water until they are two or three months old. The bulk of the catch is made up of young seals. Owing to the fact that these seals are taken upon the ice fields, and that the ice fields are so broken up at times by storms that the seals are difficult to get, and the vessels engaged in the fishery subjected to so many dangers, the annual catch of seals is subjected to natural limitations. In the larger steamers the crews number from 100 to 300 men. As the fishery reached its greatest development, and the steamers began to replace the sailing vessels, it became necessary to place restrictions upon the slaughter of the seals. At the present time sailing vessels do not leave on their voyages before March 10, and the period in which the seals are taken upon the ice lasts a little longer than a month. Notwithstanding the fact that the palmy days of this fishery are over, it will undoubtedly continue to be an important one. The regulations now in force restrict the hunting season, while the vast extent of ice fields upon which the seals breed, together with the difficulties attending their capture, will prevent the commercial extermination of the seal. It has been, and continues to be, the most important fishery of Newfoundland.

The capture of this species of seal is also participated in by a number of vessels from the north of Europe, seals being taken on the Arctic ice and about the islands of Jan Mayen.

We naturally associate the seal fisheries with the sea, but one of the most important seal fisheries of the world is that of the Caspian Sea, which has long been carried on in this brackish lake, which has no natural communication with the sea. The seal which is the basis of this fishery is a species peculiar to the locality, and no doubt found its way to its present habitat in very ancient times. About twenty years ago the average catch in the Caspian Sea was slightly over 100,000. The seals are taken somewhat after the manner of the Greenland seals, as they resort in the winter to the ice in the northern portion of the Caspian Sea, where their young are born. They are also taken on certain islands, and the usual method of killing them is with clubs. The Russian Government derives an annual income from the sale of permits for the hunting of these seals. The fishery is apparently on a good basis. Notwithstanding the presence of vast seal herds, the ordinary fisheries of the Caspian are to-day, and always have been, very productive.

Another remarkably situated seal fishery is that of Lake Biakal, in the heart of Siberia, but the range of the seals is restricted, and their numbers here are too small ever to have reached much importance.

Sea Elephant and Walrus.

One of the exhausted seal fisheries is one based upon the sea elephant, or elephant seal, that once abounded on many of the islands off the southern portion of the South American continent and the Antarctic islands generally. It existed on its favored breeding grounds in great numbers, and for many years ships visited these localities and killed large numbers of the animals for their oil, the skins having almost no value. No precautions were ever taken to preserve the race, and this

species has now become very rare. The taking of sea elephants as an industry has died out. The animal was very large, the males sometimes reaching the length of 20ft. A northern offshoot of this race of seals formerly occurred along the coast of western North America from the islands of southern California to the lower part of the peninsula of Lower California. For many years it was the basis for a sealing industry of no small importance, but was abandoned many years since on account of the practical extermination of the species in consequence of indiscriminate slaughter.

The walrus, which is of circumpolar distribution, is another seal that has been the basis of a fishery of some importance from time to time, but the species has been exterminated from all of its more accessible resorts, and is now found only in scattered hiding places in the Arctic. Less than a dozen years ago there were important numbers in the Bering Sea along the north shore of the Alaska peninsula, but they were speedily killed off, and are now found there as stragglers. At the time of my first visit to Bering Sea, a dozen years ago, I learned of 1,600 walrus being slaughtered on a sandbar in one day, the whole number being washed into the sea by an unusually high tide, and thus lost to the improvident hunters. A century ago the walrus was found in the Atlantic as far south as the St. Lawrence River.

Walrus' ivories continue to reach the world's markets in small quantities, but the supply in quantities of commercial importance can no longer be reckoned on.

These are merely the principal hair-seal fisheries, based on species still sufficiently plentiful to warrant their capture systematically. There are minor seal fisheries in connection with nearly all other species of seals scattered about the world. Many of these species are of restricted range, and their unregulated pursuit has led to their practical destruction from an economic point of view.

Fur Seal Fisheries.

The various species of Antarctic fur seals were found about the southern shores and islands of south Africa, Australia, New Zealand and the islands of the Antarctic.

About the close of the last century a traffic sprang up in the skins of fur seals, and as a result of many voyages made to those distant regions enormous numbers of fur seals were taken. From this time on there was no respite for the fur seal as long as it could be found in numbers worth taking. The various varieties exist to-day as mere remnants of the great races that were once found in those regions. By 1830 the supply of those fur seals in the southern seas was nearly exhausted. In carrying on this fishery no discrimination was made in the character of the seals taken; all seals whose skins were of any value were slaughtered, and the newly born, usually left on the killing grounds, died in consequence. In the rush for seals to the Antarctic sealing grounds the markets were frequently glutted and much of the catch wasted.

There are few parts of the world where seals of some species do not occur whose preservation would not result in the world's increase of resources in skins and oil. With most of these species their re-establishment, even at this late day, would be quite within the range of possibility. As a rule, all seals breeding on dry lands return after their migrations to the ancient and accustomed breeding places with great persistence. They can seldom be driven away from these places, and stupidly linger about them until extermination overtakes them. So regularly do they breed, and so certain are they of returning to their old grounds, that the re-establishment of the different species would undoubtedly result from the protection of these places, and the result would be the building up of valuable seal fisheries for the future.

One resort of the southern fur seal, the Galapagos Islands, lying on the equator, about 800 miles west of Ecuador, furnishes a striking illustration of this. Seals were taken from the Galapagos Islands in important numbers by the early voyagers. Between 1870 and 1882 these rookeries were visited by sealers, and as far as the meager records which I have been able to collect from the sealers still living who engaged in this fishery, about 20,000 seals were taken. The last paying voyage to the Galapagos Islands resulted in the killing of all the seals that could be found. The log book of this voyage, which was made by a sealer of San Francisco, is now in my possession. At the time of my own visit to the Galapagos Islands, in 1885, I was informed that there were only a few seals remaining about the uninhabited westerly islands of the archipelagoes. During the long-continued Bering Sea controversy, when all matters pertaining to the world's seal fisheries received a general overhauling, the history of the Galapagos seal fishery was examined, but no one supposed that the race of seals there had in any degree revived. It was with the greatest surprise that during the past month I received from San Francisco the log book of a vessel which had just returned from the Galapagos Islands with a catch of about 230 fur seals. No one supposed that there were any seals left in these uninhabited and remote islands, but the few that had escaped the slaughter of the last voyage of fifteen years ago had established themselves on the identical rookeries from which they had been driven, as comparisons of the two log books show, and the nucleus of a fine herd existed there unknown to any one. There is no doubt that it could have been developed into an important seal fishery, if the fact had been known in time to prevent its destruction by raiders. It is quite possible that a few individuals have escaped this last slaughter, and that by the prompt protection of these rookeries by the Government of Ecuador a fishery could be established.

Another species of fur seal and the most northerly offshoot of the Antarctic race of fur seals formerly inhabited Guadeloupe and other islands off the west coast of Lower California. From the scattered records that have been found, it appears that 15,000 seals have been taken there within very recent years. During my own visit to Guadeloupe Islands, a few years ago, straggling fur seals were observed about the islands, and it is possible that there is a sufficient remnant to warrant the belief that the race could be re-established if the islands were properly protected by the Government of Mexico.

It would be a good project to-day for some government to annex and protect all the inhospitable Antarctic islands where there are struggling fur seals remaining, upon which one of these profitable fisheries would in a few years be established.

In all the history of Antarctic sealing there is but one chapter of wise management and thought for the future. The Government of Uruguay has, throughout all these years, carefully preserved the fur-seal rookeries of Lobos Island, at the mouth of the La Plata River. The small rookeries of Lobos Island represent the good resulting from the careful protection of the fur seals upon their breeding grounds and exempt from the effect of pelagic sealing in adjacent waters. Although it is directly in the track of commerce, and within five miles of Maldonado, a town more than 150 years old, a profitable seal fishery has been continued to the present time. Commercial sealing was carried on at Lagos Island prior to 1820. The present lessees of the island, operating under the direction of the Government of Uruguay, placed upon the London market, from 1873 to 1892, 250,000 skins, or an average of about 13,000 a year, all these being derived from an island less than one mile in length. In 1888 I found the fur-seal herds of Sts. Peter and Paul's Island, in the Straits of Magellan, nearly exterminated by the hunters there, working among the Furgian Islands, and have no doubt that the supply was exhausted.

The history of Robbin Island, in the Okhotsk Sea, is especially interesting in this connection. This island is only about 600yds. in length, and less than 100 in width, and yet incomplete records show that more than 60,000 seals have been taken by raiders since 1870. The remnant of this herd has always remained to populate the rookery, which at the present time contains little more than 1,000 seals, and is protected by the Russian Government.

As in the case of Robbin Island, the scattered rookeries in the chain of volcanic islands stretching northward from Japan, known as the Kurils, or Smoky Islands, have been destroyed by raiders during recent years. The history of the extermination of these seals, as furnished me by men who engaged in the slaughter, is exceedingly interesting. Notwithstanding the fact that raids were made year after year, the scattered remnants of the herds still clung to their own breeding grounds. The incomplete records show that more than 25,000 seals were taken from these islands by raiders since 1880. These rookeries were visited by the Fish Commission steamer Albatross last year, and all the rookeries were found to have been wiped out of contents with the exception of one, upon which there are about 100 seals remaining. It is believed that these will certainly be protected by the Japanese Government, to which they belong.

There are only two other seal fisheries to be considered, and these are the most important of our seal fisheries of the present time. The two most important outposts of the diminishing fur seal are those of the Pribilof and Commander islands, in Bering Sea. The United States and Russian governments, to which these islands belong respectively, have for some years past been engaged in a struggle to prevent the fur-seal fisheries connected with these islands from being ruined. Upon the discovery of the islands, more than a century ago, seals were found in great multitudes. For many years they were killed indiscriminately, but the Russian Government finally took charge of them and directed the fisheries in such a way that they were regularly productive. The Pribilof Islands of St. Paul and St. George for twenty years after the accession of Alaska yielded to the United States Government in the taxes of sealskins alone more than \$7,000,000, the price paid for the entire Territory of Alaska. About ten years ago the industry of pelagic sealing, or killing of seals in the open sea, sprang up, since which time the fisheries have steadily declined.

I shall first refer to the methods practiced by the two governments in utilizing the fisheries of the two groups of islands.

During the winter months the seal herds migrate southward into the Pacific Ocean; in summer they resort to certain anciently established breeding places on the islands. There are about fifteen important rookeries on the Island of Pribilof, and a certain number of seals is selected from these, in accordance with the natural habits of the animals. The natural history of the fur seal, briefly told, is something like this: These animals are highly polygamous. Every adult male, or "see catch," as he is called, fights for the possession of a large number of females, the number varying from one dozen to 100 in extreme cases. This highly polygamous habit results in a large number of males, which surplus, when the rookeries were at their best condition, amounted to about 100,000 immature males a year. The half-grown males herd by themselves, and it is from them that the annual catch of seals on the seal islands has always been made. The United States Government has never allowed any disturbing of the breeding rookeries and has never permitted the killing of female seals. The breeding stock upon the islands has, therefore, remained undisturbed, and would, until the present time, have continued in its original abundance, had it not been for the destructive effects of pelagic sealing, which, as I have said, is practiced in the open sea, and permits of no selections being made, males and females, young and old, being killed indiscriminately. In ten years pelagic sealing, as practiced in the adjacent waters and in the Pacific Ocean, destroyed the value of the Pribilof Islands as a United States Government property, an industry for the employment of a large number of natives residing on the islands, and a profitable business for the American citizens to whom the islands have been leased. The separate rookeries on the Pribilof Islands of St. Paul and St. George are known as the Northeast Point, Polovina, Kitoyi, Lukanon, Reef, Garbotch, Lagoon, Tolstoi, Zapadni, North, East and Staraya Artil. Adjacent to each of these breeding rookeries lie the so-called "hauling grounds" of the immature males, the class of seals available for killing. These animals are quietly surrounded, and without any difficulty whatever are driven inland, entirely away from the rookeries, as easily as a band of sheep. The band

is divided up in small groups and the animals killed by striking each a single blow upon the head with a club. The skins are rapidly removed by the natives, counted by agents of the Treasury, and placed in the salt-houses of the lessees for a month's curing, when they are shipped to San Francisco. The selecting and killing is accomplished without noise or disturbance, and everything is done decently and in order.

The seals arrive at the islands in June; their young are born the latter part of June and the early part of July. After the young are born the female seals, or "matkas," as they are called, go to sea, frequently swimming as far as 200 miles from the islands, returning at more or less regular intervals to nurse their young.

The different rookery communities are divided up, as stated, into harems, each one jealously guarded by a large male. The males who arrive at the islands first fight furiously for the possession of territory. The females, arriving soon after the males have established themselves, are divided up among them. The young seals remain with their mothers for about a month, not learning how to swim until the latter part of August. The entire seal herds remain about the islands until late in the fall, when the annual migration to the Pacific Ocean takes place. The class of skins obtained under Government direction on the Pribilof Islands is of the highest quality, the animals selected being three-year-old males of nearly uniform size, killed when the fur is in best condition, and making a large number of skins of one grade. The pelagic catch, on the contrary, is obtained at sea, in season and out of season. It consists of young and old, male and female, and the skins more or less injured by shooting and spearing, the two methods employed in taking them. While the pelagic skin has only a value of from \$7 to \$10; the value of the Pribilof skin ranges from \$20 to \$30.

The merits of the claim in the United States in the long-protracted Bering Sea controversy may be seen at a glance. Our resources are wisely and economically managed, and would preserve the breeding stock forever; pelagic sealing is wasteful to the last degree, and is a suicidal industry that has practically cut its own throat. The pelagic sealing fleet, as a whole, has been losing money for two or three seasons. Renewed efforts were made by the United States Government during the past season to put a stop to it, but negotiations are for the present closed. In the meantime American citizens, a small number of whom were engaged in pelagic sealing, have been prohibited from engaging in the pursuit of seals at sea, and Congress has recently passed laws prohibiting the importation of seals taken in pelagic sealing into the United States. These restrictions, together with the fact that the seals are fewer in number each season, will probably result in driving the remainder of the foreign pelagic sealing fleet out of existence. So long as pelagic, or indiscriminate, sealing in any form remains, the restoration of the seal fisheries will be impossible. The Bering Sea controversy was precipitated by the capture of Canadian sealing vessels in Bering Sea. Later on the matter was placed in the hands of the Tribunal of Arbitration at Paris. This tribunal, having decided that the United States had no jurisdiction over Bering Sea outside of territorial limits, the Canadian Government presented claims for damages on the part of those whose vessels had been seized, and their value having been considered by the recently appointed Bering Sea Claims Commission, they will be paid for by the United States. Pelagic sealing, however, has been continued in some form during the past ten years, and the seal herd is now so greatly decimated that the surplus males available for killing do not amount to more than 10,000 a year.

The earlier dealings of the Russian Government with pelagic sealers on the Asiatic side were even more summary than those of the United States Government. The punishment for poaching on those waters was prompt. Many vessels were seized and many sealers imprisoned; in some cases the unfortunate hunters were condemned to the mines in Siberia. Sealing has been engaged in chiefly by vessels belonging to British Columbia, a few from the United States and Japan taking part in it.

Pelagic Sealing.

The ocean sealing fleets frequent four hunting grounds during the year—two in Bering Sea, adjacent to the Pribilof and Commander Islands, and two in the Pacific Ocean, off the American and Asiatic coasts. The Pribilof, or Bering Sea, sealing ground lies to the westward and southward of the Pribilof Islands. The Commander Island sealing ground extends almost around the islands, its most important part lying to the southeastward. The Japan sealing ground, which during the last four or five years has been the most important of the Pacific sealing grounds, has its southern limit in about the latitude of Yokohama. Its southern and central portions are about 400 miles wide. The American, or northwest coast, sealing ground extends from Santa Barbara, Cal., northward along the coast to Bering Sea, a distance of nearly 3,000 miles. It is divided into three favorite sealing areas. The first extends for about 100 miles north, south and west of San Francisco. The second, and most important, from the coast of Oregon to the northern end of Vancouver Island. The third extends from Sitka, Alaska, to Middleton Island.

Sealing vessels, starting out for the full season's work, engage for a short time in sealing in the winter on the northwest coast sealing grounds; then, proceeding directly across the Pacific Ocean, begin operations on the Japan coast about the middle of March. By the end of June the seals have left this region on their northward migration, and they are followed by the sealing fleet to sealing grounds around Pribilof and Commander Islands, in Bering Sea. As the sealing about the Pribilofs is not concluded until late in September, the vessels return to British Columbia generally after a cruise of nine or ten months. Although this voyage is a long one, and many of the schooners of small size, the number of disasters that have occurred is surprisingly small. The number of schooners operating in these waters has until recently varied from 75 to 100. It does not appear that the various tracts of ocean frequented by the fur seals during their migrations have any direct

relation to the coast fishing banks. The greatest part of any sealing ground is entirely off soundings, and the investigations of the last two or three years have shown that the actual food of the seal consists of squid, and not fish.

The American and Asiatic seal herds migrate nearly between the same degrees of latitude. The length of the route followed by the former is nearly twice that of the latter. It extends not merely through twenty-five degrees of latitude, but through fifty-five degrees of longitude, while the Asiatic has but thirty degrees of longitude to traverse. The greatest extreme range of the American herd is but little short of 3,500 miles. Both herds arrive at and depart from their summer habitat in Bering Sea simultaneously, and in their migrations follow the continental shores.

CHICAGO AND THE WEST.

The Hickory Bend.

The other evening, when I was at the home of a friend of mine, the lady of the house introduced a novelty in the way of comestibles, to wit, a large dish of shellbark hickory nuts, the same all cracked and ready for immediate consumption. This I call a novelty, and such it is in the city, though there was a time when it would have been no novelty either to my friend or myself. As it so happens, both he and myself spent our youth at points adjacent to the same stream, though he was about a hundred miles lower down the river than I was, and neither of us had at that time ever heard of the other, though I once walked all over his country quite in ignorance of his existence. Now all along that stream, which in its way was a wonderful one, grew many forests of those trees common to the middle West—maple, elm, hackmatack, basswood, and above all, the hickory tree. Hickory timber, more or less scattered and solitary-looking as it usually is, grew in spots back from this river, and was native to all the country lying along it for 200 miles. Even so far down the river as the point where my friend lived when he was a boy there sometimes grew that most prized tree of all trees prized by boys, the giant "shag-bark" hickory, which produced the huge hickory nuts we called the "shag-barks." All other hickory nuts were as dross to these, and the family which started in to winter with a couple of barrels of them down cellar was held one to be socially envied. These nuts cannot be bought in open market very often at any price, for the entire United States do not produce any very large crop of them.

The best of our big shag-barks in the old days were about twice as large as a large English walnut—so large that a man could not meet the finger and thumb of his hand about one of them. The meat was very sweet, not so oily and bitter as that of the average hickory nut. We boys watched very jealously the crop of any big shag-bark we had discovered, and after the first frosts had ripened and loosened the great nuts we were early on the ground with our sacks. These fine, large nuts, with red-faced apples to aid them, made the basis of many an evening's refreshments for "company" in the old days. Many a time I have mashed my thumb cracking these big nuts with a hammer, the anvil for this operation consisting of a flatiron held between the knees. Nowadays we folks who belong to the *haute noblesse* and live on souffles and that sort of thing most all the time rather feel superior to anything so good as a shag-bark hickory nut, so that I may say the hickory nut is not recognized so fully by society as, for instance, the peanut. But when I saw these big shag-barks the other evening I fell upon them with joy, and I mixed with them a plenty. It was like a section of the old times come back again, although these nuts, it was said, came from some place in Ohio, and were not quite so big as those my friend and I used to gather on our old river when we were boys.

I remember so distinctly one great horseshoe bend in the old river, known far and wide, even beyond the confines of our county, as the "Hickory Bend." Here there was a space of high, rich alluvial soil held in the bent arm of the river, perhaps a hundred acres or two in extent, and on this particular piece of soil grew a grove of the giant trees which I have mentioned. I do not know of any such trees anywhere unless it may be in parts of the rich cane-covered delta of the Mississippi River, and I cannot speak as to the nuts of that locality. In this hickory grove there were perhaps not a hundred trees in all, but each tree would in a good year shake down, I should say, a sack or perhaps two sacks full of these great nuts. I know that farmers came there from many miles away and loaded wagons with the nuts; and I recollect very well the hostility we boys felt toward grown men who thus poached on our preserves. The farmers would sometimes begin the harvest too soon, climbing the trees and threshing off nuts not yet fully ripe. Such a course was against our creed. We preferred the nuts which had fallen of their own weight, and which lay, the end of the great rough husk just temptingly open, in the rustling brown leaves which made a carpet over that rich bottom ground.

The Hickory Bend—dear me! I wonder if it is still there, or has any vandal dared to cut down the great old trees for wood? I hope it is still as it was in that respect, though in many others it can never again be what it was. Here, in the very old days, when my father was hunting deer, before I was born, this bend of the winding river was a famous place for a deer. Many is the wild turkey my father shot there, this with the old squirrel rifle which was born in Ole Virginny, and which, so they tell me, was in that gentleman's hands about as good for a turkey flying as if sitting, provided it was a fair shot on the rise. My father always said that a wild turkey would jump up high in the air and then line out its flight straight, but stopping for an instant as it changed its perpendicular to its horizontal flight. If one caught it just as it stopped at this instant, it was a stationary mark and easy for a good rifleman to hit.

In my time the wild turkeys were about all gone from that country, but I remember once seeing a flock in that bend, when we were out hunting there for wild grapes. I often saw the turkeys which my father killed, but I was not big enough to hunt then. I can just re-

member, very vaguely, of seeing the carcass of a deer once on our kitchen floor. When I began to hunt we found the Hickory Bend a good place now and then for a flock of quail that had strayed in from a nearby cornfield, and we found rabbits there, and it was one of the best places on the whole river bottom for squirrels. Here, too, was one of the best points we knew for ducks, for this bend ran far out into the bottom grass grounds, and the duck flight passed over a corner of it as it made up or down the waterway, which, at that time, was a great thoroughfare for waterfowl in their migration. I know that one time I started out rabbit hunting, one day late in the fall, when there was a little snow, and seeing a few flocks of ducks crossing the country toward the river, I kept on walking that way, some seven or eight miles, till I got to the river bottoms. At a point on the bluff opposite the Hickory Bend I saw as fine a sight as often greets a boy's eyes. Great ribbons of wildfowl were moving up the river bottom, a solid string of ducks, it seemed, almost as far as the eye could reach in either direction, and apparently inexhaustible. Slowly, confused by the storm, they seemed to be crawling along the timber in search of shelter, at a loss to know where to go. Slowly, as though pulled by some irregular hand, the vast dark ribbon wound along the wide and shallow valley, now and then rising in a deep curve or again dropping down, but always clinging to the edge of the timber. I can see that picture to-day as plainly as I could then—can see the deliberate, dull flight of the fowl, and even remember the forks and splits in the big dark band as it moved steadily up the river bottom. That was a great day for the gunners, had many known it, and when late that night I got home my father was as much excited as I.

In the fall we made a favorite picnic ground of this valued spot of the Hickory Bend, and sometimes we would make up a family camping party and spend a night there. I think it was in that same bend of the river that I spent my very first night away from home and my first night in camp; and every incident of that fearsome experience will linger in my mind always, I presume. They told me that the owl was a wolf, and I believed their cruel jest and shivered all night in terror.

The way into the arm of the Hickory Bend was a winding and long one, known not to all the drivers who could follow the plain, "main-traveled road" out from town. Here bayous at high-water times cut off the higher ridge, and one needed to know what soft places to avoid and where to keep to reach the high ground and how to dodge the tangled thickets of bush and brier. Once in to the shelter of the big trees, no wind could harm us, no matter how it howled up above. Our simple camping outfit served to make us all very happy, and we had enough to eat from the spoils of the land.

At one corner, so to speak, of the Hickory Bend was one of the deepest "holes" known in all that part of the river, and here we caught catfish at night on set lines and bass and wall-eyed pike on our minnows. One of those keen pictures which one so often carries with him of some experience of the forest or stream I have now in mind—one that happened here on one of our fishing trips. We were catching wall-eyed pike in the deep water near to the bank, and I had a bite from one of those wary fish. As I pulled up the line slowly, the fish followed up the bait and got above it, watching as it rose and apparently eager to strike it if it made any attempt to escape. The fish hung poised in the water, clearly visible, with its body partly bent and seeming full of suppressed action. Every fin all over its back was erect in anger or eagerness, and the whole attitude was plainly that of the animal about to spring. I could almost say its eye shone eagerly, but one needed not to see that last expression of keen, keyed-up vigor and readiness. The whole picture was one of indescribable grace and strength, and I can see it still, with other views from the old bend of the river, remembering it especially as the only time I ever saw a fish with anything which resembled expression or character of its own.

Such were some of the attractions of a stream which both my friend and myself knew well, and I wish we might either of us find another country which could offer the same delights that this once did. All these things are called up by the sight of the big shag-bark nuts. I am sure my friend must be mistaken in the locality from which these nuts came. Surely some of them, at least, dwarfed in these dwarfing days, must have grown on that very spot where I used to gather them when I was a boy, in the old Hickory Bend; else there could not have uncoiled from one of them so long a panorama of mental views in and about that comfortable spot. There, as they say, was the whole thing in a nutshell!

Failure of the Whitefish.

Superintendent Nevins, in the course of his report to the State Fish Commission of Wisconsin, finds occasion to comment on the scarcity of the whitefish in the waters of Lake Michigan and inland lakes. He says:

"On account of the close season in Michigan we failed to get any whitefish eggs on the west and north shores of Green Bay, where we have never failed to get a limited number heretofore. On Dec. 7 I went with a crew of four men to Long Lake, Washburn county, to get inland lake whitefish eggs for the Milwaukee hatchery. We had twenty-seven gill nets and one pound net. In eighteen days' fishing we got only 560 fish, about 100 of which were females. The result of it all is we have no whitefish eggs in the hatchery this winter."

Charles Higgins, a fish dealer of Milwaukee, says of the whitefish in his latitude:

"Twenty years ago we could go out two miles with a couple of men and a few yards of netting and catch thousands of pounds of fish, while to-day we have to employ steam tugs to go out twenty miles or more with miles of nets, and less than 1,000lbs. is the reward of a day's work. We haven't a whitefish in Lake Michigan to-day, and the trout are rapidly disappearing."

There is nothing in the above of a special interest to sportsmen, excepting the rather astonishing fact that even such large waters as the Great Lakes not only can be, but have been depopulated of their choicest fish through persistent fishing for the market. The black bass and the muscallunge are no longer taken in the

nets which ply in Lake Michigan. All the great market-fishermen realize and admit, what portions of the more inconsiderate public do not realize, that protection and restocking are necessities for even the greatest, the most inaccessible and the most prolific waters. The following table of distribution of the fry by the Wisconsin State Fish Commission during the past year shows what is being done in the way of restocking for the benefit of not only the market-man, but the sportsman: Brook trout 1,949,000, rainbow trout 1,241,000, whitefish 18,000,000, lake trout (fry) 10,000,000, lake trout (yearlings) 10,000, wall-eyed pike 23,300,000, white bass 9,115, black bass 4,500, muskellunge 1,100,000; total, 55,613,615.

Michigan Spearing.

They are having quite a circus over in Michigan on the question of spearing in inland waters. The new law has the following clause: "It shall hereafter be lawful in the months of December, January, February and March in each year to take, catch or kill through the ice, by a spear, all kinds of fish, except brook trout, rainbow trout, German or brown trout, grayling, landlocked salmon, and black bass, in any or all of the inland lakes and streams of this State, including Lake St. Clair and that part of the St. Clair River below the village of Algonac, in St. Clair county, the channels through which said river empties into Lake St. Clair, and other channels and bayous comprising the waters of said lake. Provided, that all waters, lakes and streams in this State except Maple River below its entrance into Gratiot county, which are now protected from spearing by any local act of the Legislature of this State, shall be exempt from the provisions of this act."

Believing that under the above wording of the law it was legal to spear in the Maple River, a great many persons have been thus operating along that stream, although the lawyers have been divided in their construction of the ambiguous clause regarding that water. Last week some forty persons were found spearing on Maple River, in Gratiot county, many of them having killed large quantities of fish. A test case will probably be made, it being the belief of the game warden that the best construction of the law will forbid any fishing along the Maple River within the limits of Gratiot county by any means except those of hook and line.

Duluth Fly-Casting Club.

The city of Duluth, Minn., is in the heart of one of the finest angling regions of the West. In that country the angler can go fishing and catch something, whether he be after trout, bass or muscallunge. Duluth has a great many skillful fly-fishermen, and a number of gentlemen met last week and organized the Duluth Fly-Casting Club, electing the following officers: President, J. P. Harris; Vice-President, C. H. Hoecker; Secretary, F. W. Edwards; Treasurer, D. J. Greensward.

Tip-ups Taken.

The sport of tip-up fishing continues this winter on many Minnesota lakes in spite of the law, the lakes near St. Paul and Minneapolis being especially well patronized by ice fishermen. One day last week over 300 tip-ups were found on Bass Lake. Some thirty men were operating these, and after a lively chase seven of the fishermen were arrested. All the fish found on the ice were confiscated.

Illinois Fishermen's Association.

CHICAGO, Ill., Feb. 12.—The Illinois Fishermen's Association is composed of market fishers operating along the Illinois River, the same being banded together for the purposes of getting what they want. Some 1,400 men are employed by this Association. An idea of the magnitude of the business carried on by these men may be gained by a glance at the figures submitted in the second annual report of the Association, shown in the following table:

Kinds of fish.	Total pounds	Net value.
Carp	5,489,990	\$164,699.75
Buffalo	3,061,454	61,229.08
Catfish	235,000	9,400.00
Bull pouts	285,000	8,550.00
Sunfish and ring perch	120,468	2,409.36
Striped bass	35,431	1,771.55
White Perch	394,680	23,140.00
Crappie	40,654	2,032.70
Black bass	40,621	3,249.68
Total	9,703,298	\$279,482.07

It has come to the ears of many market fishermen of the Illinois and Mississippi rivers that the Chinamen of Mott street, in New York city, consume quantities of dogfish, a species not commonly accepted as food by the public. These astute fishermen conceive that there must be a market for this fish in New York city, and some of them have asked me to learn where it is the Chinese buy their dogfish. Will any gentleman who lives in Mott street be so good as to advise me on this head? I have long been engaged in the industry of supplying jack rabbits to the worthy poor, and don't mind taking on the task of procuring the succulent dogfish for the sagacious celestial.

The Illinois State Fish Commission is on record as being in favor of the carp, although the general public is coming to believe the question of the carp is much like that of the man who caught the panther by the tail. He didn't know how to turn it loose. The Fish Commission of Missouri gives an instance of the disagreement of doctors. That State has spent a great deal of money in establishing the carp, and now it is spending a great deal of time in wishing that it had not done so. Carp have proved to be a nuisance in a great many of the waters of Missouri. E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Fishing Up and Down the Potomac.

How the Great River was Stocked with Bass.

THE man who makes two ears of corn or two blades grass grow where only one grew before, Swift held, would do more essential service to his country than the whole race of politicians put together, probably because he postpones thereby that evil day which Malthus feared, when population should outstrip production.

So he is a public benefactor who inaugurates or encourages the increase of our food fish into new waters, or better into the old.

The first introduction of bass into the Potomac is now a familiar historical incident.

Small-mouthed black bass from Wheeling Creek to the number of about thirty were carried in 1854 and '55 over the mountains in the tank of a locomotive tender and placed in the Cumberland Basin. Not long after the war made the Potomac River a skirmish line for both sides, and for some years a man who attempted to fish on either side was liable to have his cork pulled under with too much lead from the other.

Fish pots were abandoned and pulp mills were unknown; stock had disappeared and the river will probably never again be as free of pollution. The fish were thus effectually protected by their environment, and as the river was full of vast quantities of fish food the bass multiplied and spread the length of the river until it became the most noted bass stream in the world, with a far greater supply than those rivers where the bass were indigenous, but where there was less bass food and otherwise less favorable conditions.

The Pennsylvania Fish Commission in 1873 said that the Potomac supplied the markets of "our chief cities with this excellent fish. The annual catch in this river is beyond computation."

But the pollution of the waters killed off some bass, and more of their food, and their great numbers in the confined territory so reduced the food left there was no longer enough to go round, and they were driven to more and more feed on each other until the yield was so reduced as to be noticeable throughout the whole course of the river, and to attract the official attention of our National Commission.

Efforts at artificial propagation of bass have never been successful. The glutinous nature of the ova which fastens them to whatever they touch and the difficulty of securing the milt from the living male has so far defied successful handling and hatching, though we may be sure it is only a question of time and study when it will be as easily accomplished as is that of the other millions we turn out annually. Other glutinous spawn that was long thought impossible has yielded to the persistent efforts and patient research and inventive genius of intelligent fishculturists, and the time must come, and it is easy to believe soon, when bass will be manufactured and incubated by the million, as shad are now.

Meanwhile fortunately the bass' noble character, his love for his young—as long as he isn't hungry—and his ferocious fearlessness of anything that swims make him so excellent a parent and producer that we are constantly planting more than we feed, and they destroy each other. He has been much abused for his cannibalism, but this to me seems unjust. But for this all must have starved in famine times. As it is, if there is anything in the doctrine of the survival of the fittest we have saved the best. The extraordinary care which the bass manifests for its eggs and young give so high a percentage to the progeny reared that it has heretofore been amply sufficient to turn the fish loose in suitable waters, to have them multiply fast enough for all practical purposes. Given clean water and food in plenty and their increase is abundant to the verge of the miraculous.

When the Potomac was at its best its bass were the descendants of at the most fifteen pairs. The trouble to-day is they are starving to death. If half the efforts expended in adding new stock were devoted to furnishing those we have with suitable food and water the increase would be an hundred fold better than now.

For many years the Illinois Fish Commission has been throughout the State distributing native fish netted in the sloughs and lakes in the bottoms of the Illinois and Mississippi rivers. When the spring freshets overflow the banks of these rivers the waters carry out into the shallow depressions many, many fish ripe for spawning. When the floods have subsided these pools are found to be swarming with the fry of the native fish. Under the laws of the State only such places may be netted as would in all probability dry up, or freeze the fish so confined.

Even with this restriction there are millions available, and ten years ago the National Government recognized the value of this work.

Up to that time the United States Fish Commission had not taken any great interest in bass, and while admitting an urgent demand from various quarters for stocking purposes were disposed to discourage its introduction. About '88, however, they formed a sort of partnership with the Illinois Commission, paying half the expense and placing Dr. Bartlett, then Secretary of the Illinois Commission, in charge. The first year they distributed 100,000 fish from this source. Later, when Dr. Bartlett severed his connection with the State Commission, United States Commissioner McDonald appointed him in charge of the Government distribution from that point, known as the Quincy Station.

Most of the fish for this fall distribution are procured from the lowlands bordering the Illinois River.

Since that time thousands of bass have been distributed by the Commission, and thousands of anglers made happier in anticipation and in the realization of better sport.

Many waters have been stocked, and many a pond and creek that knew no higher sport than a bob and worm for sucker or catfish are now favorite resorts for fly-fishermen. Indeed in my own home in southern Illinois artificial ponds are built, and even dry and unsightly sink holes have become fish pools, in which it is a matter of gratification, but not surprise, to take 5lb. bass.

As an example of what may be done with the help of the Fish Commission, I want to tax your patience for a few moments with a letter written by a chum of mine,

the coroner of our little county, to the Illinois State Commission, and made part of their last report. As you will see by the size of the document it is most of that report, and all there is of it on this subject.

I feel of course more than a usual interest since it is from my own home and by a friend who helped surprise me with my first fly-rod, then a great curiosity in that country. Now, as you will learn from the letter, the fly is so well known that even the catfish are educated to rise to the occasion. The report says:

While it would be impossible for us to attempt to give a list of the clubs that have been formed throughout the State for the protection and propagation of the fish in our various lakes, or to give the names of those who have built ponds for the cultivation of fish, yet we cannot refrain from citing the work of that nature which has been accomplished in one section, viz., that adjacent to Waterloo, Ill., as an instance of what is being done and what might be done throughout the State.

We quote from a letter of Dr. Sennott, written in compliance with a request for a summary of the clubs and their work in his neighborhood. The Waterloo people have always been firm supporters of the Commission and its work.

"Your request for a brief synopsis of the names and locations of the various lakes and ponds in this vicinity, with a history of the organizations controlling them, has been received. I will comply with your request as far as I can. Gilmore's Lakes are situated three miles from Columbia and ten miles from Belleville, and are leased by the Belleville people under the name of the Gilmore Lake Fishing Club.

"The membership is limited to twenty and is always full. The lakes are two in number, known as Long Lake and North Lake. Each covers an area of about four and one-half acres. The water varies in depth from 1 to 20ft. They are natural lakes surrounded by forest trees and have been well stocked with black bass, crappies and sunfish. A good club house has been built on the lake.

"Island Lake, two miles north of Waterloo, is a natural body of water, crystal in its clearness, and was the first lake leased and protected as a resort by the Waterloo sportsmen. It contains a little over four acres of water, and the fish taken from it are noted for their gameness, beautiful color and fine flavor. The Waterloo Hunting and Fishing Club had this lake under their care for the last twenty years. It is now owned by a private club of Waterloo citizens. * * *

"Near Island Pond is Catfish Pond, owned by Mr. E. Grosso, and stocked with bass, crappie, catfish and sunfish. * * *

"Mr. C. Kalmer, one-half mile north of Waterloo, has a nice artificial pond well stocked with crappie, channel catfish and a few bass. These were placed there by the State Fish Commission and have thrived wonderfully. The channel catfish in the pond take the fly as quickly as do the bass, and put up as good or better fight.

"Mr. J. Herchenroeder, two miles east of Waterloo, has a lake made by damming up a small valley, which is well stocked with a variety of fish.

"The mill ponds at Waterloo have been stocked and give promise of fine fishing. * * *

"Mr. M. Crowe, five miles east of Waterloo, has an artificial pond on his farm, and it is stocked with black bass and catfish. * * *

"Lake Bartlett is a natural body of water over four acres in extent, varying in depth from 1 to 25ft. It is situated four and one-half miles southwest of Waterloo, and is leased by the Lake Bartlett Fishing Club, consisting of ten members. * * *

"The lake and club were named for Hon. S. P. Bartlett, secretary of the State Fish Commission. * * *

"Schorr Lake Fishing Club, of Waterloo, has the largest membership and is the oldest sporting club in existence in this country. It was organized by members of the Waterloo Hunting and Fishing Club, which disbanded when Island Lake passed out of their hands. This club has a beautiful club house at the lake, which is a little over a mile south of Waterloo. The water is supplied by springs that never fail, and the lake is said to be one of the finest artificial ones in the State. This club also controls Beaver Lakes, three lakes situated five and one-half miles south of Waterloo. These lakes were all stocked by the Illinois Fish Commission.

"While not in our neighborhood literally, yet near enough to count, is the lake of the Chester Fishing Club, Lake Langford, named for the late secretary of the Illinois State Fish Commission. * * * The lake is an artificial one, fed by springs, and was made by throwing a dam across the ravine. * * *

"The interest in pond culture and the care of our lakes has made fishing very popular, fly-casting being the prevailing method. Many of our boys have become quite expert. A size limit as to fish caught is a rule in most of the clubs, and our people are being educated to the necessity of the protection of our waters in every way possible."

This, gentlemen, illustrates what organization and the help of the Commissions will do. This little town of which my friend writes has not many more than 2,000 inhabitants; the county has no fish streams, and yet we have raised carp of 28½lbs. in weight and bass of 6lbs., and what is better have afterward taken that 6lb. bass with a fly. This is not intended as a challenge, but only for encouragement.

I am indebted to Mr. Ravenal for the list of bass deposited in the Potomac:

When.	Who.	Where.	Number.
1891-2...	Woodmont	Potomac River	2035
1892-3...	Wash. R. & G.	Piscataway	1000

* Small-mouthed black bass.

Besides these there were returned to the waters of the Potomac last year from the Chesapeake and Ohio Canal about 12,500 bass, and this year already in the neighborhood of 1,000.

There are bass plenty in the river. The embouchure of every creek in the Lower River fairly swarms with large-mouth black bass. Tide water gives them feed in abundance, and a 7-pounder was captured at Chopevamsic last year. With clear water there will always be good fishing to be had below if the small bass can be protected.

Above something must be done toward introducing feed. The minnows are gone and scarcely anything but carp remain, and these soon outgrow the small-mouth bass. The mills and mines help kill off the feed. The situation mathematically stated is that if we can add to the feed and subtract the pollution the bass will multiply in a geometrical ratio, and of course we'll have more to divide. Q. E. D. HENRY TALBOTT.

Game Qualities of the Rainbow.

TRAVERSE CITY, Mich., Feb. 7.—*Editor Forest and Stream:* I have been a subscriber to FOREST AND STREAM for more than ten years; and as I like to hunt, fish and go camping, and have paddled, rowed and sailed on Grand Traverse Bay for nearly thirty years, it is needless to say that I read it from cover to cover with keen pleasure; but I sometimes come across things that make me shake my head, and I am tempted to get up and speak in meeting; but I find that the more I learn the less I seem to know, especially about fishing.

But when one writer says the rainbow trout lacks in gaminess, I boil over. There are lots of them within five miles of where I am sitting, and there would be more if I were not, and if my tackle had been stouter there would be less, so I feel confident in asserting that for downright fight they lead my list of the acquired. They have smashed my rods, broken my leaders, and run off with my bait, as well as reduced my stock of flies to hardly more than a few ends of gut. I have known a 3-pounder to go out of water fifteen times, clear around my boat three times and under it once, all inside ten minutes.

Now let not somebody bob up and say I don't know what other fish can do, because I do know, having gathered in trout along a hundred miles of the North Shore of Lake Superior, and bass and pickerel and perch and bluegills and sunfish, muskalonge and herring and whitefish and suckers and—and there are others. Still the rainbow, like the Ben Davis apple, may differ in different localities. The apple grown in Missouri is said to be of fine flavor, while here even an Indian won't steal one.

I was much pleased with Shaganoss' article in the issue of Dec. 18 last. Surely he in his old age has arrived at wisdom. He knows more than I do, for I don't know that as a rule bass and trout won't bite just before a severe storm. On memory's wall there is a vivid picture of an evening on the pond just above the Boardman River Electric Light Co.'s dam. My wife and I were out just at dark. There was not a breath of wind, and all around there rested that ominous calm that is only met on the eve of a furious rain and wind squall. In the east the moon rode serene, while high above the opposite horizon towered dark masses of clouds, seamed and jagged lightning, and occasionally the earth fairly trembled with the distant thunder.

Fish were rising occasionally, and Mrs. M. hooked a rainbow that weighed over 3lbs. the next day. Then there was fun fast and furious. It was the largest trout she had ever tied to, and he went into the air, under the boat and back, and finally in desperation started for the bottom. Now, there are logs and brush about 6ft. down in that neck of the woods, and I shouted—yes, fairly hollered—to her to hold him up, which she immediately tried to do by slipping her right hand up to the middle of the butt, and—the second joint let go. Did we lose that trout? Not much. I seized the line and hauled him up, gaffed and had him under me in the boat before he knew what the trouble was all about.

When we had time to look up the storm was almost upon us, and we made a break for camp, where we put in some lively work keeping the canvas over our heads.

And there are other pictures. One I remember is of two of us clad in oilskins, standing on either end of a 16x36in. canoe and hauling in bass after bass while it thundered and lightened and rained till we had to go ashore and empty the water out of our boat, as it made her rather unsteady under foot.

Now, this does not prove anything except that fish don't bite unless they feel like it, and then they will at any hour of the twenty-four.

My experience has taught me just one thing for sure, which I wish every beginner would paste on his nose where he could feel it when it is too dark to see; and that is, if you are going fishing, hunting or sailing before breakfast, eat breakfast first, and a good breakfast is a cup of good, hot coffee with bread, butter and a couple of eggs. I spoiled many a morning's pleasure before I learned this. V. E. MONTAGUE.

New Jersey Coast Fishing.

ASBURY PARK, N. J., Feb. 14.—Indications point to a very early movement of coastwise fishes. Already the herring are on the move; quantities have already been taken in the lower waters of Barnegat Bay. Perch and bass also are in evidence in that paradise of waters for the angler. Should the warm weather continue we will

undoubtedly have them with us in the early part of March. While the perch are taken during the entire winter in some localities, still their movements in estuary waters appear to be governed largely by the herring, as they are much together and ascend the streams at the same time. While their food undoubtedly is of an entirely different character, still nature's prompting has something in common for both species, and where one is the other may be looked for.

The recent assertions in metropolitan publications that the perch does not descend to salt water is of a most absurd character, inasmuch as they are often taken in the nets and fikes of our local fishermen, and I have taken hundreds in our tidal streams, using shrimp bait. As if to more particularly emphasize the fact, one was picked up on the beach at Belmar on the 6th of the present month, and was still alive. Besides, hundreds are taken every spring by the boys in their dip-nets in the surf when they are plying for herring. LEONARD HULIT.

A Labrador Opportunity.

DR. MORRIS has given us permission to publish this note, telling of a Labrador opportunity which we are sure will be eagerly embraced by some reader of FOREST AND STREAM: "I have given up my plans for an outing in Labrador next summer, and my two good men will be out of employment. Don't you know of some one who would like to make use of them? Their charges are \$3 per day (for both together), and they furnish the big trap boat that I knock about in. They are both good rough cooks, tireless and cheerful workers; and they know the whole coast and the entrances to the rivers. Salmon and sea trout and brook trout are to be had in abundance, with plenty of shooting at seals, bears and caribou, if one cares to hunt for them in the summer time—I do not. I will give particulars to any one wishing them. ROBERT T. MORRIS."

The Kennel.

Fixtures.

BENCH SHOWS.

March 1.—Baltimore Kennel Association's third annual show Baltimore. W. P. Riggs, Sec'y.
March 8.—Northwestern Kennel Club's dog show, St. Paul, Minn. C. E. N. Howard, Sec'y, St. Paul, Minn.
March 15.—Kansas City Kennel Club's second annual show, Kansas City, Mo. A. E. Ashbrook, Sec'y.

Alabama Field Trials Club's Trials.

THE second annual trials of the Alabama Field Trials Club, run at Madison, Ala., were distinguished, from every point of view, as one of the most successful efforts ever attempted by any State organization. They were run at Madison, Ala., beginning on Feb. 7. Four stakes, a Derby, all-age, puppy and champion, were hotly contested, and were good exhibitions of their respective classes.

The attendance was large, not less than from thirty to forty horsemen following the dogs each day. Among the visiting sportsmen present were Messrs. H. H. Mayberry, C. F. Eastham, T. H. Spencer, F. W. Dunham, T. T. Ashford, Drs. George Eubank and G. Chisholm, Birmingham; Hon. R. H. Lowe, W. E. Everitt, A. Moore, J. H. Wallace, Jr., Huntsville, Ala.; W. H. McKleroy, Anniston, Ala.; D. E. Rose and J. Myers, of Tennessee; E. J. Hudnall, Pratt City, Ala.; W. J. Allen, Bessemer, Ala.; Gen. H. T. Peebles, Mooresville, Ala.; H. and C. S. Tiney, Swancott, Ala.; Caleb Toney, Triana, Ala.; William N. Hundley, Greenbriar, Ala.; George Gray, Appleton, Minn.; J. B. Stoddard, Thomasville, N. C.; Dr. Darwin, C. E. Meglemry, C. Scruggs.

The judges were Messrs. W. B. Hamilton, Columbus, Miss., and W. B. Stafford. Their decisions were in every instance well received.

The weather was fine throughout. On Wednesday it was exceedingly warm. The fields are broad and open, and so free from ditches and creeks that riding in them is a pleasure, although in regard to this it may be stated that the horses were poor performers under the saddle.

Madison is in Madison county, a county in the center of the northern part of the State, and bordering on the Tennessee boundary line. It incloses a part of what is called the garden spot of Alabama. Level in character about Decatur, as one approaches Huntsville the surface is noticeably rolling. There is too much cotton for a first-class bird country. There is also a scarcity of feed, and the ground being so free from cover, the hawks make an easy prey of the birds. It is hardly necessary to add that birds were scarce. Nevertheless, be the horses uncomfortable to ride and the birds scarce, everybody had a most enjoyable time.

A meeting of the club was held on Feb. 8. It is in good financial condition, with a large membership. Several new members were elected. The following distinguished gentlemen were elected honorary members: Ex-Gov. R. W. Cobb and Gov. J. F. Johnson, of Montgomery; J. S. Cox, Birmingham; Mayor W. T. Garner and Capt. J. H. Floyd, Madison; Col. R. Barwell Rhett and W. M. Holding, Huntsville.

T. T. Ashford was elected President; First Vice-President, Hon. R. H. Lowe; Second Vice-President, W. H. McKleroy; Secretary-Treasurer, H. H. Mayberry; Game Wardens, Monroe Hardage and F. G. Hertzler; Veterinarian, Dr. A. Gibson; Board of Governors, Dr. G. Chisholm, T. H. Spencer, Dr. G. Eubank, H. H. Mayberry, H. S. Smith, J. J. Odom, R. H. Lowe, W. H. McKleroy, F. G. Hertzler, W. M. Hundley, C. E. Mitchell, W. E. Collier, Dr. R. S. Henry. The club decided to hold another trial next year. A vote of thanks was extended to the judges.

The conditions of the Derby as to entering were \$2.50 to enter, same amount to fill. The all-age stake conditions were the same. No entrance was required in the puppy stake.

Monday—The Derby.

The competition was begun in the Derby first. Prizes, 50, 30 and 20 per cent. of entrance money.

T. H. Spencer's b. w. and t. setter dog Tony Dick (Tony Boy—Blue), owner, handler, with J. B. Rosenstihl's b. and w. pointer dog Dan R. (Love's Kent—Brook's Belle), W. M. Hundley, handler.

R. H. Lowe's b. and w. pointer dog Mack L. (Ripsaw—Cricket), owner, handler, with W. M. Hundley's l. and w. pointer dog J. J. O. (Ripsaw—Cricket), owner, handler.

J. W. Beard's l. and w. pointer dog Jack Spratt (Miller's Jack—Cleo Kent), W. M. Hundley, handler, with Nat Stanley's l. and w. pointer dog Hull Gull (Von Gull—Mack's Juno), T. T. Ashford, handler.

W. E. Everett's b. and w. pointer dog Dick the Devil (Lad—Cricket), W. M. Hundley, handler, with W. J. Allen's b. w. and t. setter bitch Volena (— — — — —) owner, handler.

C. E. Meglemry's l. and w. pointer dog Rex of Birmingham (Old Top—Lou H.), W. M. Hundley, handler. A bye.

First Round.

Tony Dick and Dan R.—Down at 9:40; the heat lasted 45m. The country was open and favorable for good ranging. A bevy was flushed by horses. Tony pointed a bunch of singles and was steady to shot. The birds were scattered along a fence, where the handlers might have secured more points had they handled their dogs better. The setter made the better showing.

Mack L. and J. J. O. were cast off at 10:45; down 45m. The brace was worked near woods most of the time. A bevy was seen to flush ahead, both dogs running about at the same time. J. made a point on one which flushed wild. Mack made a flush and chase, and gave tongue. Next Mack made game, but failed to locate. J. made a flush. Both were fairly good goers, Mack the better. Both had puppyish ways.

Hull Gull and Jack Spratt ran a very ordinary race of an hour's duration, no birds being found. They were put down again after the first series was finished (2:45) and then ran 17m. Spratt flushed a bevy and dropped. No points were made on the singles, though the dogs were worked on them.

Dick the Devil and Volena were cast off at 1:32. Dick made a point on a bevy in a plum thicket and was unsteady. Next Dick chased a bevy. The performance was ordinary. Dick was the best mover.

Rex ran alone from 2:15 to 2:42. Soon he pointed a bevy and was unsteady to flush. He showed good bird sense and his range was quite fair.

Second Round.

Tony Dick and J. J. O. began at 3:15. They ran nearly an hour without any success in finding. They hunted diligently and their range and speed were good.

Dan R. and Mack L. were cast off at 4:15 and ran 30m. Mack made a point in a plum thicket and drew about, showing some timidity when working on the trail. He stopped on the bevy. It flushed and he chased, after which he chased one of the singles on his return. Each made a point on the singles, but on the whole it was poor work.

Rex and Volena were started at 4:53; down 32m. Rex showed the better speed, range and judgment.

The winners were: First, Mack L.; second, Tony Dick; third, Rex of Birmingham.

Tuesday—The All-Age Stake.

There were 19 entries in the All-Age Stake, and out of these 7 started. Prizes, 50, 30 and 20 per cent. of entrance money.

Rex of Birmingham with H. H. Mayberry's pointer bitch Alabama Girl (Von Arron—Lady Mull), owner, handler.

T. T. Ashford's l. and w. pointer bitch Hattie D. (David of Hessen—Fitz's Fay) with W. B. Townsend's pointer dog Kent Elgin II. (Kent Elgin—Julia Paine), Dr. G. Chisholm, handler.

Wm. M. Hundley's l. and w. pointer dog T. T. A. (Kent Elgin—Cleo Kent), owner, handler, with Tony Dick.

R. H. Lowe's pointer bitch Cricket (Osborne Ale—Queen Fan), owner, handler. A bye.

First Round.

Rex and Alabama Girl showed some playfulness at the start, but soon settled down to hunting. Girl pointed a small bevy at the edge of woods. Sent on. Girl pointed a bevy, which flushed ahead. Rex was close by it, standing. On the singles in woods Girl made two points; Rex one. Girl was the faster ranger and the steadier worker. The heat lasted 35m., ending at 9:37.

Hattie D. and Kent Elgin II. were started at 9:45. They ran 29m. Kent made a point on a bevy and chased it. On singles he made a point and a chase. He showed good speed and range. In working for himself he seemed to have good capability, but he was not trained.

T. T. A. and Tony Dick started at 10:16; down 36m. Dick pointed a bevy, and afterward made a point on one of the single birds. His nose was keen and he was industrious.

Cricket was worked alone. He was steady, reliable, heavy and fat. He pointed a bevy in woods. The birds were not followed. Down at 10:55.

Second Round.

Tony Dick and Alabama Girl started at 11:30. Dick pointed a bevy in sedge. Girl made the better display of speed and range. Dick was industrious, however, but he seemed to be weary. Up at 12:05.

The Puppy Stake was run in the meantime.

Rex and Tony Dick were cast off at 3:00. Rex pointed a bevy in a plum thicket. A lot of time was devoted to work on the singles without any success. The birds were in very thick cover. Sent on. Both pointed and drew, but failed to locate. Sent on. Rex made game and went on, and the birds were afterward flushed by the horsemen. Poor work. Up at 3:43.

First, Alabama Girl; second, Rex of Birmingham; third, Tony Dick.

Dick showed better work in locating the birds. He did not abandon the scent when he found it if the birds were there.

Puppy Stake.

There were four starters.

Dan R., W. H. Hundley, handler, with T. H. Spencer's setter dog Clay Gladstone, owner, handler.

T. Peeble's b. and w. pointer dog Tom Tee, W. M. Hundley, handler, with C. L. Smallwood's l. and w. pointer dog Ben Eder, T. T. Ashford, handler.

Dan R. and Clay ran 38m., beginning at 1:00. Dan showed good speed and range. No birds were found. Clay was a young puppy.

Tom T. and Ben were cast off at 1:44. Ben was the better in every way. Tom, a young puppy, would not hunt. Up at 2:02.

Ben and Dan started at 2:18. Ben followed his competitor at first, then hunted quite well. Dan was the better in range and speed. He showed good quality and is a good puppy.

No birds were found by the puppies.

Dan R. won first.

Wednesday—The Champion Stake.

The event of the trials and the one most anxiously expected and most hotly contested was the race for the cup and the title of champion of Alabama. There were six starters in this contest. This stake was open to any dog owned in Alabama.

Ashford & Odom's l. and w. pointer dog Von Gull with Alabama Girl.

C. E. Meglemry's l. and w. pointer dog Rex with J. J. Odom's b., w. and t. setter dog Sport McA., owner, handler.

F. W. Dunham's lem. and w. pointer dog Elgin's Dash, Dr. Chisholm, handler, with Dr. George Eubank's b., w. and t. setter dog Landseer, owner, handler.

First Round.

Von Gull and Alabama Girl began at 8:00 and ran 2h. Girl going at speed flushed a bevy in cornfield. She turned, came back and more birds flushed. She next made an uncertain point on a bevy. Von pointed a single. Sent on to find a new bevy. Von made game in a likely place, raking the ground very close with his nose. He worked very close to a feeding bevy, then went on hunting. The birds were flushed by the horses. It was a wretched piece of work. A lot of time was taken up in looking for singles without any work on them being secured. Both dogs finished well, and they worked much alike as to range and speed.

Sport McA. and Rex of Birmingham were cast off at 10:00 and were run 2h. Sport was first to find. He dropped to a point on a bevy and Rex flushed it. Sport behaved well. Sent on, Sport pointed as a single flushed. Again sent on. Sport made game for some distance on a sedge ridge, but failed to locate. Some of the spectators said that the birds had flushed. Sent on. A bevy was seen to flush, and on the scattered birds afterward Rex was seen to be suspiciously near as they flushed. After a long search Sport made game; Rex close by flushed the bevy. On the scattered birds in woods, Sport made a point. Rex pointed one, then chased it.

Landseer and Elgin's Dash began at 12:30. They also ran 2h. Both were wide rangers, Dash the faster. Landseer at the edge of sedge drew to a point; Dash was already in before him and had the birds. The birds flew but a short distance, and each made points on them. The dogs soon afterward were worked on new ground. Landseer after some slow work in trailing a bevy pointed it; the work was fairly well done. On the singles Dash made a point and a flush. The weather was then very hot. The dogs covered a lot of ground and showed excellent capabilities in a general way—that is, in range, speed and bird sense.

Second Round.

Von Gull and Elgin's Dash were cast off at 3:40 and were ordered up at 4:05. After quite a lot of ground was worked out Dash made game. The birds flew some distance back on the course. Dash made a point on a single marked bird, to which he was coached by his handler, the point was of no special merit. Sent on. Dash made a long cast and pointed a single bird. Von soon pointed a part of the bevy. Both then made a good showing on singles, each securing three or four good points. This was the best work of the trials.

Von Gull won first. I thought that Dash should have won. He showed the best nose and best work on birds. He ran two heats in a hot time. Von's work on a bevy in the first heat was bad, as has already been related. The scarcity of birds was a drawback to the trials. The club intends to stock its grounds for the competition next year.

Boston Dog Show.

(Special Report.)

THE fourteenth annual dog show of the New England Kennel Club was scarcely the success as a show of dogs the management anticipated. Boston has always been a favorite show town, but with one exception the shows have never been a success financially. The management therefore this year determined to curtail expenses and make the exhibitors pay for their own fun by adhering to the former entry fee of \$4 and charging \$5 to enter a kennel. This was a radical reform, and naturally the professional dogman was disgruntled, and not seeing his expenses, stayed away. This made light entries in many breeds, and especially so in the pointer and setter classes, compared to old days. However, the new move resulted in a more amateurish show; the amateur element in affairs canine was out in force, and at no show held lately was this so noticeable. To make the point more conspicuous, it is understood that many of the exhibitors took advantage of the club's offer to give cups and medals in lieu of money. This is always a healthy sign in sport.

The arrangements of the show, under the careful eyes of Mr. James L. Little, the secretary, and President Samuel Hammond, were complete. Mr. Jean Grosvenor was also well up with his work. The show used its own clean benching, affording a very attractive appearance.

Under the superintendency of Mr. T. Farrer Rackham the details of good show management were carefully looked after, and the ring paraphernalia was very

complete. Mr. Edward Brooks had charge of the ring stewards, selected from members of the club, and these attended to the rings in fine style.

The number of dogs benched was 398, and entries numbered 535. This was a falling off of about 400 from last year. The catalogue was gotten up very carefully, and there will be few errors to come under Secretary Vredenburg's axe.

The attendance was very good, excepting, of course, during the blizzard of Wednesday; but for this the club would have come out ahead. As it is, the financial ends about meet. The best of feeling prevailed during the show.

The club have claimed Feb. 14 to 17, 1899, for their next show, and the management, having had enough of reform prize lists, will make every endeavor to have a jubilee show for their fifteenth annual.

The judging was completed the first day, excepting a few specials.

The sporting special was won by the cocker spaniel champion Baby Ruth, owned by the Mepal Kennels, the beagle Blitz, owned by Howard Almy, being the runner-up.

Mr. R. D. Perry judged foxhounds, and contrary to expectation, the Brunswick Fur Club did not support the show; consequently the entry was light and not of very good all-around quality. The best dog was Yorick, an English-American hound, well set up, especially in forepart. The winner of the B. F. C. Derby last year was generally preferred to Song for second place, but had to give way to Snowflake, a rather lightly built sort. A capital bitch came forward in junior bitches, A. B. McGreor's Gipsy, to my mind a better all-round hound than the ultimate winner of the winners' class, Yorick; Snowflake again nipped in for second, but Fashion is a good hound, and more on the lines of the winner.

Mr. George W. Lowell judged pointers and accomplished his task well, although he had no very momentous question to decide. The novices may be passed over with light comment. The winners, F. J. Lenon's Trilby Bang Bang and Zella Strideaway, are faulty in heads, but Trilby's running gear and body were praiseworthy. Mollie Strideaway, third, is a rather soft-looking sort all round. The winner in junior dogs, E. W. Foote's King of Lynn, is a good old-fashioned sort, though a bit heavy in shoulder. He had nothing much to beat. Flintlock (R. Flynn's) is an excellent dog, but his head is poor. Betty M., the winner in bitches, is one showing much quality, and had one of the best heads on the bench. But the two best pointers in the show were Urada and Kent's Kate, placed as named in the free-for-all class, and owned by F. J. Lenon. They are well known as good typical pointers.

Dr. H. Clay Glover judged the setters, and he made no error; he has had many a harder judging task. The setter exhibit was poor, with only a few really fine dogs. The puppies in English setters did not amount to much. In junior dogs a very well-made one, H. A. Belcher's Gus Rockingham, a little dished in face, but well built throughout and well shown, was first over two moderate animals, Mr. Robinson's Lem Bondhu and N. L. Chaffin's Jack, the latter very plain. Albert's Ranger was the best setter, and won alone in senior, free-for-all and winners' classes.

Irish setters were few in number and nothing extra in quality. The three winners in junior dogs were little apart. Royston Redman was better in body and legs than R. W. Ropes' Robert. Miss Stranie's Prince Echo, third, was third one on the English setter type. A capital bitch, Toronto Mollie, came forward in junior bitches, rich color, nice head and body, in which she excelled Monroe's Iver. Red Cloud, a frequent winner, was first in senior, and in the free-for-all division Pride's Beauty scored; she is a little weak in muzzle, but good elsewhere. Chief Red Cloud was counted the best in the lot in the winners' class.

Gordon setters were poor. Dan B. is just fair in formation, but his coloring is not rich enough. Lilly B. is a very plain sort, according to bench show form; her head is too short and lacks character. All the other classes were empty. In the novice class for all setters, Calla E., a sister of Gus Rockingham's, was an easy first, sweet quality and beautiful build, especially in rib development; an Irish setter, Rory O'More VII., though a very fair-looking dog, is just about as far removed from the style of his noted ancestor as his numbers denote.

The spaniels were judged by Mr. A. Clinton Wilmerding. He had not a task that demanded much judicial acumen. There were no Clumbers or Irish water spaniels. A very pretty cocker bitch was exhibited, Mepal's Opal, a well-formed little one that was, however, beaten by her sister, Topham's Fantasy, a coarse bitch more of the field stamp, but looks like work. Topham's Selma was too fat.

Beagles were out in force, and made a very attractive display. The best were a promising puppy by Hempstead Beagles' Florist and his sister, Beautiful. Millard R. made a meritorious win in novices, a well-built hound that gets his tail up too high. A very pretty bitch is Gladstone, the winning bitch; shows much quality, and is of sturdy build. Almy's Blitz, a capital all-round hound of good type and quality, beat Millard R. in the field trial class, and a good-bodied one, Leader, was reserve; his head is not so good as the others. A capital bitch, about the best beagle in the show, was Purity. She is a well-set-up hound all over, but a bad shower in the ring. She won in junior bitches over 13in., and also the special for best bitch. In the corresponding dog class Blitz and Millard R. were the winners. Among the small-sized ones Leader scored over the poor-headed Orator, who, however, does well in body and legs. A pretty bitch is the junior class winner, standing about 12in., and built like a little cart-horse, plenty of bone. Frances was the only senior entry of this size. Purity won the free-for-all prize easily. Blitz was in the dog winners' class and Purity in that for bitches. The best two dachshunds were Bronzie and Jangle. Others, with the exception of Choc'lit, were only moderate.

ENGLISH SETTERS.—Puppies: 1st, P. Player's Psyche. R., Keyes' Lady Elmo. Junior class—Dogs: 1st, H. A. Belcher's

Gus Rockingham; 2d, Robinson's Lem Bondhu; 3d, N. L. Chaffin's Jack. Senior class: 1st, S. W. Carey's Albert Ranger. Free-for-all class: 1st, S. W. Carey's Albert's Ranger. Winners' class: 1st, Carey's Albert's Ranger.

IRISH SETTERS.—Junior class—Dogs: 1st, Royston Kennels' Royston Redman; 2d, R. W. Ropes' Robert; 3d, Miss D. Straine's Prince Echo. He., A. C. Train's Dan Train. Bitches: 1st, Douglass & Chamber's Toronto Mollie II.; 2d, J. A. Monroe's Iver. Senior class: 1st, Claremont Kennels' Chief Red Cloud. Free-for-all class: 1st, Claremont Kennels' Pride's Beauty. Winners: 1st, Claremont Kennels' Chief Red Cloud.

GORDON SETTERS.—Junior class—Dogs: 1st, T. M. Gollin's Don B. Bitches: 1st, R. Price's Lilly B.; 2d, Smith Bros.' Dellmont. All setters—Novice: 1st, H. Belcher's Calla E.; 2d, Ellen Joy's Rory O'More VII.; 3d, Smith Bros.' Dellmont.

POINTERS.—Puppies: 1st, R. Flynn Jr.'s Tick; 2d, J. B. Austin's Max Strideaway; 3d, H. L. Haddock's Slick. Novice class: 1st, F. J. Lenon's Trilby Bang Bang; 2d, R. Robinson's Zella Strideaway; 3d, Austin's Mollie Strideaway. R., Flynn's Flintlock. Junior class, 55lbs. and over—Dogs: 1st, E. W. Foote's King of Lynn; 2d, A. H. Houghton's Houghton's Bang. Under 55lbs.—Dogs: 1st, Flynn's Flintlock; 2d, Tucker's Kent II.; 3d, G. B. Boothby's Duke Kent III. Under 50lbs.—Bitches: 1st, McQuillen's Betty M. Free-for-all class, any weight: 1st and 2d, Lenon's Urada and Kent's Kate. Winners' class: 1st, Lenon's Urada.

BEAGLES.—Puppies—Dogs: 1st, Hempstead Beagles' Boaster; 2d, M. M. Billing's Barty; 3d, Round Plain Kennels' Ranter. Bitches: 1st, Hempstead Beagles' Beautiful; 2d, Ridgewood Kennels' Rosemary. Novice class—Dogs: 1st, A. J. Purrrington's Millard R.; 2d, Hempstead Beagles' Boaster; 3d, Waldingfield Beagles' Orator. R., Glenwood Beagle Kennels' Harker, Jr. Bitches: 1st, Comedy Kennels' Gladstone; 2d, G. L. Stewart's Jessie; 3d, Round Plain Kennels' Melody. Field trial class: 1st, H. Almy's Blitz; 2d, Purrrington's Millard R. 3d, Ridgewood Kennels' Fashion. Over 13in.—Junior class—Dogs: 1st, Almy's Blitz; 2d, Purrrington's Millard R.; 3d, Round Plain Kennels' Timothy. Bitches: 1st, Hempstead Beagles' Purity; 2d, G. F. Reed's Reed's Flirt; 3d, Baldwin's Ado B. Senior class: 1st, Ridgewood Kennels' Fashion. Under 13in.—Junior class—Dogs: 1st, The Hempstead Beagles' Leader; 2d, Waldingfield Beagles' Orator; 3d, Sunset Kennels' Satanic. Bitches: 1st, S. E. Thurton's Fan R.; 2d, Waldingfield Beagles' Marjory; 3d, Hempstead Beagles' Beautiful. Senior class: 1st, Glenwood Kennels' Frances. Free-for-all class: 1st, Hempstead Beagles' Purity; 2d, Rogers' Ben Perley Poore; 3d, Billings' Barty. Winners' class—Dogs: 1st, Almy's Blitz. Bitches: 1st, Hempstead Beagles' Purity.

The New York Show.

THE twenty-second annual bench show of the Westminster Kennel Club commenced on Feb. 21 under most unfavorable conditions in respect to weather. The cold rainstorm which set in on Saturday was still unended. The day was damp, slightly foggy, chilly, with a slight drizzle betimes. The weather predictions were more favorable for a change to good weather. The opening was not marked by any specially heavy attendance, and in this respect the unfavorable weather alone would have an unfavorable effect on amusement seekers or enthusiastic fanciers.

Dr. H. Clay Glover, the club's veterinarian, reports that the dogs arrived in remarkably healthy condition. Only three were rejected.

The judging was progressing slowly up to the middle of the afternoon of Monday. Mr. George Raper, who has crossed the ocean five times to judge at this show, arrived only the day before on the Campania. The Squantum Kennels lost two Boston terriers from suffocation. The quality of the dogs was very good as a whole.

POINTS AND FLUSHES.

Some time ago Mr. Luke W. White, then of Baltimore, was charged with violation of the City Code in refusing to remove a dog when ordered to do so by Mayor Hooper. Mr. White at the time was maintaining a dog hospital, and on complaint of his neighbors the Mayor took action as above mentioned. Mr. White refused to obey the notice, and in consequence he was indicted by the Grand Jury. Judge Stockbridge, on Feb. 15, decided that the ordinance was invalid, thereby sustaining Mr. White's demurrer, interposed by his counsel.

The judge held that the Legislature had clothed the Mayor and City Council with ample power to deal with the matter at issue—that is, the existence of alleged nuisances—but they had gone too far in constituting the Mayor the sole judge of what constituted a nuisance, and this on an ex parte hearing.

Mr. George W. Rogers, secretary of the National Beagle Club, writes us that "An executive committee meeting of the National Beagle Club of America was held Feb. 8 at 171 Broadway. Members present, H. F. Schellhass, J. W. Appleton, George B. Post, Jr., John Bateman, G. Mifflin Wharton and George W. Rogers. Alfred B. McClay was elected to membership. A new form of payment in the Futurity stake was submitted and ordered sent out to beagle owners. A brass die was donated by Messrs. Kernochan & Appleton, to be used at all dog shows by members of the club, each die designating the name of each dog entered by a member of the club. Members can secure them by applying to the secretary."

The coursing for the Waterloo cup was concluded on Feb. 18. Wild Night was the winner. The Waterloo purse was divided between Real Turk and Jissy Smith. The Waterloo plate was won by Genetive.

Yachting.

AND now the well-known Yampa is to be robbed of her old name, to start life anew under the more ambitious appellation of Iduna. Of course, it might have been worse—Meteor III., for instance—but still the yacht has now lost her individuality and the reputation she has made as a deep-water cruiser on both sides of the Atlantic.

The Belfast Lough Jewel Class.

WE reproduce from the Yachting World the accompanying design of a very useful type of centerboard boat, from which the Jewel class of the Ulster Sailing Club was built. The design was made in the fall of 1896 by Mr. Linton Hope, and eight boats were built, at a cost of £52 each (\$260) by William Roberts, of Chester; two more have since been added to the fleet. The boats

JEWEL. BELFAST LOUGH ONE-DESIGN CLASS.

have proved very successful, affording excellent sport in the races, of which some two dozen were sailed last year. The dimensions are: Length over all, 24ft.; l.w.l., 17ft.; beam, 6ft. 6in.; draft, 1ft. 6in.; with board, 5ft. 6in.; least freeboard, 1ft. 6in.; sail area, 275sq.ft.; ballast, centerboard, 3cwt.; iron cast to fit inside, 15cwt. The roller jib is so fitted as to be swung out, serving as a spinnaker.

The Luck of a Calm.

My friends had congratulated me warmly on my good luck in getting a junior partnership with the firm of Scroggin & Swayles so soon after completing my law course. No doubt it was a good thing compared with the likeliest alternative—a small back office on my own account, with few clients and precious small earnings for a year or two.

But after the first few months of satisfaction I began to think that after all Scroggin & Swayles were having the best of the bargain. My share of the profits under the agreement was less than the salary of one of our clerks who did far less work and had not a tithe of my responsibility. To be sure I was getting a living, but the senior partners were getting so much more, I really felt that my services to the firm must be altogether underestimated, and determined to speak to Scroggin about it. He was the man who directed the affairs of the firm with an iron hand, and whose fiat was always final. How much he consulted Swayles I could not exactly make out. If ever they failed to agree, it was in private, for to the office an unbroken front was maintained, and that front was always Scroggin Q. C.—the eminent counsel who was quite accustomed to having his own way even with refractory witnesses.

With him I must deal finally, but as a preliminary I sounded Swayles and stated my case. He listened quietly, as he did to everybody, and did not offer comment or interruption until I had finished with a somewhat excited declaration of my intention of "tackling Scroggin." Then he smiled and shook his head. "No use," said he. "At least it would be no use to tackle Scroggin the way you have tackled me. He would simply take a professional delight in arguing you down. And a man who commands the fees he does for an argument is not a novice at the business. You have not been in the firm very long, and you are not doing so badly after all. Whenever the opportunity offers I will certainly not only agree, but urge that your share of the profits be increased. But you had better leave the initiative to myself or — Scroggin. I know you are working hard, and he knows it too, although you might not think so. We never do things by halves, and it's a long road that has no turn. If you happen to distinguish yourself, particularly in connection with any case, it will likely hasten the turn. But if you take my advice you will not push matters at present."

I took his advice, and said no more about the matter. I was kept busy enough, but mostly with routine work at Osgoode Hall and general office humdrum—not the kind of thing to give me any chance to distinguish myself. I was on the lookout for lucky accidents, and of course they did not come my way. Rather the opposite occurred, particularly in regard to one case that from an office standpoint was very satisfactory—that is our client had lots of money and was willing to spend it in litigation.

It fell to my lot to get some of the evidence in shape, in which process it appeared that a young lady residing in Rochester, N. Y., would be a very material witness. For some reason our client left it to us to secure her attendance, which could only be by consent, as she was out of the jurisdiction of the Ontario courts. I went over to see her, armed with instructions to offer a substantial witness fee in addition to all expenses; she told me quite frankly all she knew about the matter, and it was just the evidence we wanted too. When I broached

JEWEL.

the subject of her attendance at court, she hesitated. I thought I would clinch matters by mentioning the witness fee, and she at once became highly indignant and declined to make any promises. I had evidently bungled the thing, and after in all probability making matters worse by more urging and argument I came home crestfallen. Scroggin was handling the case and he received the report of my trip with an amused smile, which annoyed me more than anything else.

That was early in May, and the case was not to come on until September. Time was on our side and the young lady might yet be induced to come over and help us. Meanwhile work on the case continued, and every time it turned up I felt a twinge of annoyance. If Scroggin was at all worried about it he did not say so, but proceeded with the work as though the witness was of no consequence, until he suddenly discovered

that he needed a trip to Europe, and bounded off, leaving everything to Swayles. I one day suggested that another attempt should be made to secure her evidence at the trial, but Swayles seemed very indifferent about it, and I concluded that he and Scroggin had decided to get along without her. Their indifference to the matter might have reassured me, but it had the opposite effect. To my mind that witness was indispensable, and I gradually worked myself up to the belief that if we lost the case the absence of her evidence and indirectly my failure to secure it would have to bear the blame.

By the middle of July Swayles concluded that there was nothing to prevent his going to Muskoka for six weeks, and away he went, leaving me in full charge with formal instructions to keep him posted and consult him on matters of importance, modified by something like a wink and a caution not to bother him about

trifles. Evidently the firm had considerable confidence in the junior partner, so much so that the individual members had left him no chance for summer vacation. However, one may enjoy a summer in Toronto, and my opportunities in this direction were good.

I had a half interest in a 25ft. yacht, just the thing for afternoon sailing, and comfortably fitted out for cruising. The other half was owned by D'Arcy Renfrew, a good yachtsman and excellent companion for an outing, and between us we did not let the canvas mildew for want of hoisting. Bright and breezy afternoons frequently induced me to desert the office at an early hour, while every week end saw a cruise to Oakville or Frenchman's Bay, and once in a while Niagara or Port Dalhousie. So the summer passed until Civic holiday came due, and D'Arcy and I concluded to make it a chance for a longer run than usual.

On the previous Friday night we stowed an extra supply of provisions and made everything shipshape for a start as soon after lunch on Saturday as possible. Unless there should be a head wind we were to work along the east shore, making a good long sail of it, with Sunday and Monday to get back in. Saturday morning of course saw me at the office hastily opening the mail and hoping that nothing would turn up to prolong the morning's work beyond noon or half past, not only for my own sake, but for that of the staff, who were all going out of town, as various satchels and general holiday attire showed plainly. There was nothing much in the mail—the "case" turned up and annoyed me as usual, but beyond that I got through early, signed the salary checks, and was off by noon after wishing all hands a good time.

D'Arcy had been as lucky as myself, and we met at the entrance to the yacht club wharf. The old salt who looked after the small craft assured us that our supply of ice, milk and bread had been put aboard, and we lost no time in manning the dinghy and getting there ourselves. The sail cover came off and the mainsail went up with a snap and vim that showed the crew was used to working together and the gear in good order. The working topsail went aloft next and then the jib was run up, the mooring slipped and the cutter Rosalie paid off on the starboard tack with a fine southwest wind lifting her along to the eastern channel and every prospect of a long spikaker run ahead. In this we were not disappointed. The wind held well and we scudded before it past Scarboro Heights and the Palisades, past Port Union, which is not a port at all; past the Rouge and Frenchman's Bay and still to the eastward, reveling in the steady summer breeze and the glorious sunlight.

Five o'clock found us nearly abreast of Whitby, and I asked D'Arcy if he wanted to put in there, not expecting at all that he had any such desire. "No," he said, "why should we? The town is two miles from the harbor and no good when you get there. With this breeze we shall make Cobourg to-night. It is a decent place and there are some jolly people there that I know. Let's stand on and make use of a fair wind, now we have it."

I quite agreed with him and suggested that he get supper ready, for I was decidedly hungry. He plunged below and rummaged about the galley, lighting a fire and spreading our little swing table with the choice variety of delicacies that always turn out on the first meal of a cruise. It was well we started the supper early, for it takes time to get a meal ready on a small craft, and we had to take turns at steering and feasting.

By the time it was over and the dishes carefully washed and stowed the wind had fallen light and we were prospecting on the chances of the weather with easy indifference. We were in no hurry. The wind would likely shift and come off shore after sunset. That would suit us very well. It would take us into Cobourg. If necessary we could drop into Darlington.

By 8 o'clock the wind had dropped altogether, and we took in the spinnaker and proceeded to tidy up our gear. It was clouding up over the shore and looked a bit uncanny; we thought it meant wind before long and that was what we wanted, for there was some sea left by the afternoon breeze, and without steerageway we plunged unsteadily. An hour passed and the night had settled down dark and damp, no moon and no stars visible, nothing to be seen in fact except Darlington Light blinking faintly in the distance.

I was feeling a bit sleepy and chilly as well, and the prospect of an all night sail did not fascinate me. I suggested to D'Arcy that when we did get a breeze we might as well put into Darlington and get a fair night's rest, and leaving him to keep a lookout went below to put on a heavy coat. The well-lighted cabin looked exceedingly cheerful after the murkiness outside, and it was warm too, for a few coals still glowed in the galley stove and the kettle was full of hot water. A little Scotch whisky would not hurt me, and when I was about it I took it hot, then filled my pipe and lounged back on the cushioned locker for a lazy smoke. The pipe did not draw well, so I laid it aside.

I must have dozed off then, for some time later I was awakened by D'Arcy's voice on deck shouting "Ahoy!" I started up and asked what was the matter.

"I don't know," he said, "I heard a voice out in the lake—it sounded like a cry of distress, and it was a woman's voice too. Perhaps somebody is in trouble out there."

"Very strange," I remarked, and we both listened intently for a couple of minutes, straining our eyes over the water, although there was little chance of seeing anything. Then he shouted again, but no response came. "You must have been mistaken," I said, but he stuck to his story, and even spoke of going out in the dinghy to investigate.

He got a lantern on deck, although our side lights were burning brightly, and shouted again. This time there was a response that we both heard, a shrill voice that really answered his description, only it was nearer, he said, and taking the lantern he pulled off in the direction of the sound. I watched the light bobbing up and down in the boat as he pulled out fully a quarter of a mile, then suddenly changed his course and stopped. Presently he came back again at a slower pace, the reason of which was evident when he came alongside, for he had another boat in tow.

"Catch that skiff," he said, meanwhile coming aboard and making fast his own painter in the starboard rigging.

As I did so a lurch threw the light from the cabin port holes on the face of a woman sitting in the bottom of the skiff. "Help her out," said D'Arcy, and we each took a hand and fairly lifted her on deck. She was almost too weak to stand, but D'Arcy helped her down into the cabin and got her comfortably seated.

He took it all very coolly, as though he was quite used to that sort of thing, but then he had the faculty of getting along with women that always astonished me. I said nothing and let him alone, for the first of the land breeze was coming off shore, and I busied myself making fast the two boats astern and trimming the sheets to get the yacht under control. I took the helm, and on looking down into the cabin saw him administering a glass of brandy and water to our passenger, and then he watched her with the air of a physician. The effect was immediate and beneficial, for she revived sufficiently to talk a little.

"Thank you so much," she said, "I feel better now. I could never have stayed out in the boat another night. You see I went out rowing yesterday morning when it was quite calm, and I must have got a long way from shore. Then it got rough so suddenly, and I could not get the boat back. The more I rowed the further from shore I seemed to get. After a time I could not see the shore at all, and I was so frightened. It has been rough ever since, and I did not know what to do, and I was too tired and sick to row any more."

"Where did you start from?" asked D'Arcy.

"From Charlotte; I live in Rochester; and, oh! my friends will not know what has become of me."

"We will telegraph them as soon as we get into port," he replied, "and now I must introduce myself. My name is D'Arcy Renfrew, and my friend is Fred Weston. Come below, Fred."

So he had recollected me at last. I went down, leaving the Rosalie to steer herself in the light wind.

As skipper of the craft I did not propose to allow the crew to do all the honors. She looked at me curiously, and then started as though recollecting herself, "I am Miss Armour, of Rochester, and—why I think I have met you before, sir."

D'Arcy looked at me in blank amazement.

She was my much desired witness. "I am so glad," she added. Just what this meant I did not know, except that she was reassured to find herself not in the company of entire strangers.

The awkward pause was broken by D'Arcy, who suggested a cup of tea and some supper, and set to work to prepare them. A sudden heeling of the yacht warned me that the breeze was freshening, and excusing myself I went on deck. D'Arcy soon had the table spread, and our guest did not need much inducement to eat. He looked after her and himself also, while the skipper was treated to a hand-out on deck. Later on he induced her to have a nap on the locker and joined me.

We went on for Cobourg, and tied up at the piers just at daybreak on Sunday morning.

The first duty was to telegraph to Miss Armour's friends, and this was managed at the early hour through the operator at the Grand Trunk Station. After that I proposed to escort her to a hotel, but she disliked the idea of her adventure exciting any publicity, so D'Arcy, who seemed to consider her his special charge, hunted up some of his friends—a risky thing to do at such an early hour—and confided her to their care. Then we turned in on board the Rosalie and slept until noon. After dinner we made some calls, including Miss Armour, and found her looking quite well, thanks to a good sleep and a general fixing up.

Needless to say, I had no intention of letting the occasion pass without making some further attempt to secure her as a witness, but after my previous bungle I was doubtful how to proceed. Had the trial been coming on immediately I might have got her served with a subpoena before she left Ontario, but I was mistrustful of any attempt at coercion, and concluded I must depend on gentle persuasion. Seizing a chance for a quiet chat I introduced the subject cautiously, when she met me half way just as promptly as she had previously declined my offer of a witness fee.

"I know what you want, Mr. Weston," she said, "and although I dislike the idea of appearing in court, and am not very friendly to your client, I would not think of refusing to oblige you personally after your kindness to me. Only I want no fees of any kind—I would not touch a cent of your client's money, and besides I do not need to."

Of course I let it go at that, and on Monday Miss Armour left for Rochester on the North King, while we went back home on the Rosalie with a fine off-shore breeze. She was as good as her word, however, and came to Toronto for the trial in September. Thanks to her evidence, as much as anything, in my opinion, we won the case, and whether it was a coincidence or not I cannot say, but soon after Scroggin asked me to step into his private office and sign a new partnership deed, much more favorable to me than the first one.

The romance ended there so far as I was concerned, but I am not sure about D'Arcy. He was quite attentive to Miss Armour when she came to Toronto, and he has been to Rochester since on several flimsy excuses. But, as I said before, his dealings with the gentler sex are beyond my comprehension. W. Q. PHILLIPS.

The Interlake Y. R. A.

THE annual meeting of the Interlake Y. R. A., of Lake Erie, was held at Cleveland on Feb. 12, the following delegates being present: Capt. E. P. Sharp, Buffalo Y. C.; Com. George T. Bliss, Erie Y. C.; Capt. E. W. Radder, Cleveland Y. C.; Capt. George Anderson, Sandusky Y. C.; John Holloway, Put-In Bay Y. C.; Com. Henry Tracy, Com. S. O. Richardson, Com. J. E. Gunckel and O. K. Schimansky, Toledo Y. A.; Capt. William Jupp, Detroit B. C.; Otto Barthel, West End Y. C.; and John Rathbone, Detroit Y. C.

The following officers were elected: Com., A. I. McLeod, of Detroit; Vice-Com., Henry Tracy, of Toledo; Rear-Com., George T. Bliss, of Erie; Sec'y-Treas., Otto Barthel, of Detroit; Meas., J. W. Hepburn, of Toledo; Fleet Surgeon, Dr. E. E. Beeman, of Cleveland.

Race Committee—George F. Anderson, of Sandusky; W. R. Huntington and Ed Overbeke, of Cleveland; J.

A. Rathborn, of Detroit, and George Waite, of Toledo.

Capt. E. W. Radder, of Cleveland, was re-elected delegate to the North American Y. R. U., and a vote of thanks was tendered him for his work in the past in that capacity.

The delegates to the Yacht Racing Union of the Great Lakes are E. W. Radder, B. F. Hower and Otto Barthel.

The following amendments were adopted:

1. Add to Section 2, Rule 8: "But such increase of rating shall affect the R. L. of such yacht for purposes of time allowance only, and not for purposes of classification."

2. Strike out "galley fittings and" in third line of Section 1, Rule 14.

3. Amend Section 1, Rule 15, by substituting "five" persons in place of "six" as the number allowed on 27ft. class boats.

4. Substitute the following in place of Section 3, Rule 15: "In all races each yacht of 42ft. R. L., or under, must be steered by a Corinthian, who must be a member of a recognized yacht club belonging to one of the associations of the Union; and must be manned by Corinthians, except that any such yacht may carry the number of professionals regularly employed on the yacht, but not more than two in any case."

Under caption of "Meetings" in by-laws change time of annual meeting from second Wednesday in February to "second Saturday of each February."

A committee was appointed to consider the question of a one-design class to take care of the boats under 22ft., inasmuch as the rules of the Great Lakes Union do not provide for that size class. It was decided to hold the annual regatta at Put-In Bay on July 25. The table of scantling prepared for the Yacht Racing Union of the Great Lakes by W. P. Stephens was submitted to the delegates, all present expressing the opinion that only good results could follow from it. After the meeting the delegates were entertained at a reception given in their honor.

The Defense of the Seawanhaka Cup.

THE Montreal correspondent of the Boston Globe writes as follows:

The most interesting thing that is yet known about the arrangements on this side of the line for the Seawanhaka cup races is that Æmilus Jarvis will again compete for the honor to sail the cup defender. The offer made, it appears, by Mr. H. Montague Allan, the Montreal head of the firm of A. & H. Allan, of which Bryce Allan is the Boston head, to build a boat, was made on the express condition that Jarvis was to sail her. If the commodore agrees to do so it will add greatly to the interest, for a race between Jarvis and Duggan is of even more interest to Canadians than one between Crane and either of the Canadian skippers.

Naturally the consummation of the Allan arrangements has been somewhat delayed by the absence of the commodore in England, and as it is nothing will be known for some days as to what will happen. Some profess to believe that Jarvis will refuse the offer because during his visit here with his queer craft, Bonshaw, last summer he positively stated that he would enter no more championship matches, but would only sail in future in friendly club races. Still, the temptation to break his resolutions then made is great in this particular case, for it is understood that he can either design and build his own boat or can have her designed and built when he gets here. Besides, another brush with Duggan must be a hard thing for him to refuse.

As far as preparations in general go, the Royal St. Lawrence Y. C. is away behind the Seawanhaka Y. C. To come down to hard pan, really only one boat has been ordered yet in a definite manner, and that is the one for the brokers' syndicate. There are others spoken of, like that of Mr. Allan, but they are still problematical. One thing is certain, and that is that unless they hurry up, the members of the Royal St. Lawrence Y. C. will find themselves in the middle of the summer season without any new boats ready to go into the preliminary trials.

Several of the old boats of last year will go in again this year, particularly Glenowen and the victor, Glencairn II.

"The Yachting Monthly."

Having attained the dignity of its fifteenth volume and a success which it has well deserved, our contemporary the Yachtsman has launched a new and ambitious venture in the shape of a monthly magazine devoted exclusively to yachting. The first number of the Yachting Monthly Magazine, which reached us last week, needs none of the excuses usually claimed by the initial number of a new publication, but is quite capable of standing on its merits. No doubt the future numbers, of which we hope there may be many, will show improvement, but the first one is a marked exception to the usual run of nautical experiments in the publishing line. Its letter-press pages, numbering 94, are supplemented by four large folding plates of designs and four half-tone plates of yachting scenes.

The leading article is on the "Probable Revival of Schooner Racing," by Harry Horn, an appropriate subject just now. Mr. Horn gives a very interesting history of schooners and schooner racing from 1851 down to its decline in the early 80s, but falls into the usual error of British writers of calling the famous sloop-schooner Maria, built by the Stevens Brothers, the Black Maria. There is no record on this side of the ocean of the yacht ever having carried such a name.

The table of contents, in addition to this article and a short introduction, is as follows: "Poor Little Spunyard," "Notes from a Leafless Notebook," "A Fortnight in a Half-Rater," "Our Designs," "A Ladies' Match," "The Search for a Name," "A Tamar Trip," "Thames Sailing Punks," "A Lost Rowlock," "The Log of the Dabren," "Outmaneuvered," "In Sydney Harbor," and "A Channel Pirate." This list includes cruises in various sizes of craft, descriptive articles, and yachting fiction; the illustrations, of which a number appear in the text, being really excellent.

The publishers of the two journals have instituted a series of quarterly designing competitions, open to all persons who have never prepared a design for money, the subject being announced in advance. A first prize of £5 and a second of £2 10s. are given, the first design being published in the Yachting Monthly Magazine and the second in the Yachtsman. The subject of the first competition was a cruising yacht of 36ft. l.w.l. and not over 7ft. draft, the winning design, Serpolette, by R. E. M. Lengerke, being a handsome little keel cutter of moderate form, 50ft. over all, 36ft. l.w.l., and 11ft. beam, with full limit of draft and 1,826sq.ft. total sail area. She has main and ladies' cabins, a good steerage and roomy fore-cabin. The subject for the next competition, closing this week, is a single-hand cruiser. One of the large plates shows a very handsome open sailing boat, designed by the late Mr. John Gordon Kelly, of 18ft. 13in. over all, with nearly plumb ends, 5ft. 8in. in beam and 2ft. depth amidships, with knife board. The subscription is 15s. 6d. per year. Apropos of the designing competition, the first one brought out seventeen designs.

Gilberts Bar Y. C.

WAVELAND, Fla., Feb. 10.—*Editor Forest and Stream:* The Gilberts Bar Y. C. held their usual monthly regatta Saturday, Feb. 5. The wind was light from the northeast. In the first class there was only one entry:

First Class.	Actual.	Corrected.
Britannia	0 49 12	0 49 12
Swallow	0 45 59	0 45 59
Uncle Sam	0 58 00	0 57 56
Gypsy	Did not finish.	

Winner, Swallow. PAUL M. ASTON, Sec'y.

YACHTING NEWS NOTES.

The annual meeting of the Larchmont Y. C. was held at Delmonico's on Feb. 16, the following officers being elected: Com., Clarence A. Postley, schr. Colonia; Vice-Com., Edward S. Hatch, yawl Huron; Rear-Com., Charles F. Ulrich, schr. Carlotta; Sec'y, Oswald Sanderson; Treas., William Murray; Meas., John Hyslop; Trustees to serve three years: Edward J. Greacen and William B. Jenkins. The secretary's report showed a membership of 567 and a fleet of 314 yachts. The committee appointed to consider the advisability of the club joining the Yacht Racing Union of North America made its report, and on motion of Oswald Sanderson the club empowered the board of trustees to take such action as they deem advisable.

The annual meeting of the Corinthian Fleet, of New Rochelle, was held on Feb. 15 at the Murray Hill Hotel, New York, the following officers being elected: Com., Samuel L. Swett, sloop Volante; Vice-Com., George G. Tyson, schr. Nirvana; Rear-Com., Charles E. Simmons, schr. Osprey; Treas., Charles Chamberlain; Sec'y, W. Irvine Zerega; Meas., Lincoln Moss; Governors: 1900, Charles Pryor, Charles E. Simmons and Charles Chamberlain; 1899, George F. Pelham, W. Wharton Hollingsworth, M.D., and Frank Sargent Grant, M.D.; 1898, George G. Tyson, Samuel L. Swett and E. Handford Sturges. The following committees were reported: Regatta, W. Irvine Zerega, W. P. Stephens and O. H. Chellborg; Delegates to Yacht Racing Union of Long Island Sound, W. P. Stephens and W. I. Zerega. After the meeting the club and its guests enjoyed an excellent dinner.

Intrepid, schr., E. T. Hunt, sailed from New York on Feb. 10 and arrived at Bermuda on Feb. 15. Capt. John Holly is in command.

The annual meeting of the Quiney Y. C. was held on Feb. 5, the following officers being elected: Com., John T. Cavanagh; Vice-Com., Edwin E. Davis; Sec'y and Treas., James S. Whiting; Meas., William C. Harrison; Executive Committee: William P. Barker, Henry M. Faxon, George E. Pfaffmann, John W. Sanborn. Ex-Com. John Shaw was made an honorary life member of the club by a unanimous vote, and Mr. Henry M. Faxon was made an honorary member. The sum of \$500 has been raised by subscription for the new interclub trophy for the 21ft. class of the Y. R. A. of Massachusetts, and designs have been submitted by the leading New York and Boston silversmiths.

Mr. Frank Bowne Jones, who has had such an active part in the organization of the Y. R. A. of Long Island Sound, and later in the North American Y. R. U., has given up his former business and will in the future devote himself to yacht brokerage and similar work; he is located at 29 Broadway, New York.

After serving the Yacht Racing Association as secretary from its organization in 1875 until the present time, Mr. Dixon Kemp has been compelled to resign on account of ill health. The Association has just elected Mr. B. Heckstall Smith as secretary.

The Yonkers Y. C. elected the following officers: Com., T. J. Shaughnessy; Vice-Com., William J. Bright; Treas., J. W. Shaughnessy; Fin. Sec'y, W. B. Pink; Recording Sec'y, Sydney Media; Fleet Captain, George Warren; Meas., William Brazier; Trustees: George B. Warren, John J. Murphy, H. James, and J. Pitchford; Delegates to the New York Yacht Racing Association: T. J. Shaughnessy, William J. Bright and E. C. Williams.

The famous old 40-tonner Tara, one of the most successful racing craft during the 80s, is being broken up at Fay & Co.'s yard at Northam. She was built in 1883 for Mr. Francis Taylor, by Hatcher, Clifford & Co., at Southampton. She was altered from a cutter to a yawl in 1891, when she was purchased by Mr. W. East, her present owner, and put back under the cutter rig in 1896. Tara was the crack of the 40-tonners in 1883, but May in the hands of Capt. John Barr sailed her very hard and won almost as many prizes. Tara was the longest of the old 40s, and had an enormous displacement for her dimensions. The Yachting World, from which we copy the preceding, might have added that Tara was designed by Mr. J. Beavor Webb, and like her smaller sister Freda did much to establish his reputation as a racing designer.

The skimming dish has still a home in Germany, as instanced by a yacht now building at Heidmann's yard, Hamburg. She is 58ft. over all, 38ft. l.w.l., 14ft. beam, with 2ft. 6in. draft, and a sail area of 2,200sq.ft.

Mr. J. J. Astor has appealed from the adverse decision recently rendered in his suit against the owners of the steamer Mary Powell, which steamer ran down and sank the electric launch Coreyra last fall.

The Royal St. Lawrence Y. C. has elected the following officers: Hon. Com., Lord Strathcona; Com., Mr. James Ross; Vice-Com., Mr. A. F. Riddell; Rear-Com., Mr. W. Barclay Stephens. Committee: Messrs. G. H. Duggan, F. A. Crathern, A. W. Morris, W. A. C. Hamilton, J. E. Schultze, Robert Lindsay, E. K. Greene, Jr., C. H. Routh.

A yacht club by the name of the Reed's Lake Y. C. has just been organized at Grand Rapids, Mich., the officers being: Com., William S. McKay; Vice-Com., F. W. Toby; Sec'y, E. E. Dryden; Treas., A. E. Robinson; Meas., Alfred Baxter. Racing Committee: A. W. Hompe, E. E. Dryden, R. N. Irwin. The clubs starts out with the following members: William S. McKay, Charles Baxter, Dr. Collins H. Johnston, E. E. Dryden, Charles Rood, M. B. Walton, Walter Winchester, A. W. Hompe, C. S. Bacon, A. Baxter, G. W. Gere, F. W. Toby, K. Van Hoi, R. W. Irwin, A. E. Robinson, Charles Luce, Percy Reed, Ralph Tietfort and Cyrus Hatch.

The annual meeting of the Atlantic Y. C. was held on Feb. 14 at the Waldorf, with Com. Gould in the chair. The following officers were elected: Com., Frederick T. Adams, schr. Sachem; Vice-Com., Harrison B. Moore, steamer Marietta; Rear-Com., J. Herbert Ballantine, steamer Juanita; Sec'y, David E. Austen; Treas., George H. Church; Meas., George Hill; Trustees: J. Rogers Maxwell, George J. Gould, Newbury D. Lawton, Philip G. Sanford, Thomas L. Watson and J. Fred Ackerman. Committee on Membership: Howard P. Frothingham, J. M. Ceballos and Henry B. Howell. Regatta Committee: David E. Austen, George W. McNulty and Henry C. Barnet. The following amendments to the by-laws were unanimously adopted: Chapter 4—Regular meetings of the club shall be held on the second Monday of February, April, June and September. The meeting in February shall be termed the annual meeting. These meetings shall be held at a place and time to be appointed by the commodore or the board of trustees. Notices thereof shall be mailed to each member at least three days prior thereto. Chapter 5, Section 7, to read as follows: The commodore when afloat shall carry a broad rectangular pennant, blue ground, white letter A, similar to the club signal, with sixteen blue stars in the letter A. The vice-commodore shall carry a pennant similar to that of the commodore, excepting that where that is blue his shall be red. The rear-commodore shall carry a pennant similar to that of the commodore, except that outside of the letter A the ground shall be white and the letter A shall be red, with sixteen white stars. The acting commodore's pennant shall be the same shape as that of the commodore, but entirely blue. The fleet captain's flag, to be displayed when he is on duty (as a boat flag or as circumstances may otherwise require), shall be rectangular in shape, color blue, with red letter A, similar in form to that on the club signal. The racing rules of the Y. R. U. of N. A. were accepted by the club. The dates of June 7 and 14 were discussed for the annual regatta, the choice being left to the commodore. Twenty-four members were elected. The club has increased its membership by eighty-three during the past year, making 483 in all, with 250 yachts in the fleet.

The steel steam yacht Niagara II., built by the Harlan & Hollingsworth Co. for Mr. Howard Gould, was launched at Wilmington on Feb. 19, being christened by Miss Katherine Clemmons. The yacht is 272ft. over all, 24ft. l.w.l., 36ft. beam, 27ft. depth, to spar deck, 19ft. deep to main deck, and 16ft. draft, bark rigged, with twin screws. The contract called for her completion in April, but it will be some time later before she is ready for sea.

Canoing.

American Canoe Association, 1897-98.

Canoe Racing in Winter.

THE members of the American Canoe Association hold each spring, in some available locality in New England, a "meet" of canoe men; but this year, at the Sportsmen's Show, in Mechanics' building, Boston, March 14-26, they will have the unusual advantage of a midwinter "meet." Valuable individual prizes will be offered for such contests in canoes as can be run off in the miniature lake. They will include the following events.

1. Club tug-of-war; nine men to each canoe; one-minute heats; best two in three.
2. Tug-of-war in war canoes; picked teams; one-minute heats; best two in three.
3. International tug-of-war between winners of event No. 1 and picked Canadian team.
4. "Club 4" tug-of-war; four men to each canoe; one minute heats; best two in three.
5. Tug-of-war; four men to each canoe; picked teams.
6. Tandem hand-paddling upset.
7. Club tandem tug-of-war; three men in each team.
8. Tandem tug-of-war; picked teams; three men to each canoe.
9. Blindfold hand-paddling race.
10. Hurry-scurry race.
11. Exhibition upset.
12. Tournament.
13. Tug-of-war; four men to each canoe; Micmac Indians versus picked team.

All communications should be sent to L. S. Drake, Auburndale, Mass. Entries close March 1.

The New England Sportsmen's Association will also present a most attractive schedule of swimming events, both professional and amateur, and will award valuable trophies to the winners. The miniature lake will be about 60ft. long and contain 220,000gals. of water, and will offer exceptional facilities for these events. The following amateur events have been arranged:

1. Team race; four men in a team; eight lengths of the lake; team prize and individual prize.
2. Open single race; 100yds.; first and second prizes.
3. Open single race; 200yds.; first and second prizes.
4. Water polo; team and individual prizes.
5. Diving competition; first and second prizes.
6. Tub race; first and second prizes.

The following is a list of the professional events:
1. Open single race; 100yds.; prizes \$15, \$10 and \$5 in the event of more than three entries.
2. Open single race; 220yds.; prizes \$30, \$20 and \$10 if more than three entries.
3. Open single race; 440yds.; prizes \$35, \$25 and \$15 if more than three entries.

Relay races and team races will be arranged, provided a sufficient number of entries are received; and the management reserves the right to run off all events in heats if deemed advisable, according to the number of entries.

All entries should be made before March 1, to L. S. Drake, room 6, Pierce building, Boston, where full information may also be obtained.

Rushton's Canoes.

WE have received from J. H. Rushton, Canton, N. Y., the 1898 catalogue of canoes, boats and launches made by him. The Rushton canoes and boats are too well known to need description, but the long list of models has been thoroughly revised, the best and most popular, both of canoes and boats, being retained and improved. An important addition to the catalogue is the line of power

craft, from 11ft. 6in. in length upward. The smallest of these are of rowboat model, with square stern, fitted with a 1 H. P. Sintz gas engine. The same engine is also fitted into a 17x34 hull of canoe model, with elliptical counter, carrying two or three persons. From these the list runs up to larger hulls and engines. Mr. Rushton still sticks to white cedar as the best material obtainable for light craft. He now lists a serviceable houseboat, with hull 32ft. by 9 and house 20ft. by 9. The book includes a full list of sails, canoe and boat rigs, camping outfits, oars, paddles, etc.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Rifle Range and Gallery.

Shell Mound Range.

SAN FRANCISCO, Feb. 14.—The marksmen at Shell Mound range were favored yesterday with good shooting conditions. A large number of the National Guard were out for practice. The Germania Schuetzen Club held its regular all comers' shoot. For the diamond medal, only one entry allowed, D. W. McLaughlin made 226, Dr. Rodgers 213, F. Schuster 213, L. Bendel 205.

On the 3-shot contest A. Strecker 72, J. Utschig 71, Dr. Rodgers 70, Mr. Morken 70.

Columbia Pistol and Rifle Club scores for the day:

Pistol, 50yds., Columbia target, only one entry:

Champion class: F. O. Young 43, J. E. Gorman 47, A. B. Donell 48, Dr. Rodgers 51, and M. J. White 65.

First class: G. M. Burley 64, D. W. McLaughlin 70, and F. E. Mason 80.

Second class: Mrs. M. J. White 66, A. Hinterman 66, and A. H. Cady 95.

Third class: B. P. Jonas 95, J. P. Cosgrave 96.

The 10-shot pistol shoot for the Siebe medal, open to all comers, was held with this score: J. E. Gorman 38, F. O. Young 44, A. B. Donell 50.

In the 50yds. .22cal. rifle shoot for ladies for the Ross trophy Mrs. M. J. White scored 38-44, and Mrs. J. Manuel 95.

For the all comers' rifle medal at 200yds.: T. E. Mason 48, A. H. Pape 53, Dr. Rodgers 58, F. O. Young 55, D. W. McLaughlin 61.

For the Bushnell medal: F. O. Young 46, A. H. Cady 40-40.

For the members' rifle medal: A. B. Donell 54, J. E. Gorman 62, A. H. Gehret 80, A. H. Cady 97.

For members only:

Champion class: D. W. McLaughlin 55, A. H. Pape 56, Dr. Rodgers 57, F. O. Young 60, A. Strecker 83.

First class: J. E. Gorman 73, O. A. Bremer 87, J. E. Klein 90.

Second class: G. Borley 77, M. J. White 95, A. Hinterman 99, A. H. Cady 157.

Third class: B. Jonas 118, E. Woenne 151, Mrs. White 160.

ROEEL.

Zettler Rifle Club.

At the recent annual meeting of the Zettler Rifle Club officers were elected as follows: Henry W. Myer, Captain; Bernard Kumm, Recording Secretary; H. B. Michaelson, Corresponding Secretary; George Wehrenberg, Financial Secretary; N. A. Bevesten, Treasurer; Barney Zettler, J. C. Bonn and Frank Facompre were chosen shooting masters. Thirty-four members participated in the shoot on Feb. 11. The contest was at short range, 10 shots, possible 250. The scores:

Frank Facompre 237 points, Dr. C. Grosch 236, J. C. Bonn 234, J. A. Christen 232, C. F. Offerman 228, J. G. Thoecke 228, Peter Feigel 227, Henry Norbruck 227, H. B. Michaelson 225, Bernard Zettler 224, J. N. Herrmann 223, Charles Steffens 221, Charles Sievers 220, N. Bevesten 220, A. W. Lamcke 220, H. W. Meyer 219, John Gobber 218, Fred Feldhusen 217, William Wessel 213, Henry Koster 210, G. T. Lawrence 208, Charles Mann 207, A. O. Lederhaus 205, George Golle 204, B. A. Wragge 204, F. H. Ehlen 200, J. Riebeschl 198, J. A. Caplan 193, A. A. Bankauf 192, Henry Decker 190, G. F. Doehl 190, Henry Hoerenberger 189, F. S. Schulz 187, John Paradeis 151.

Wahnetah Rifle Club.

PHILADELPHIA, Pa., Feb. 12.—The Wahnetah Rifle Club, of this city, made the following scores at their range during the past week:

German ring target, .22cal. rifle, 25yds., possible 250. First challenge: W. Devoe, on his four rounds, made the descending scale, as follows: 241, 239, 235, 234; P. Yost on his three rounds followed suit with 235, 234, 232. H. Young on his only round scored 210; J. Yost followed with only 223.

Second challenge: W. Devoe rung up 239, 234, 236, 234, 239, 235, 235. P. F. Yost brought his figures to 224, 225, 230, 233, 236. J. M. Yost scored 227, 233, 221. Thomas Wallace scored 218, 221, 223. George Knox scored 178, 147. W. Jones scored 206. M. Reese scored 164.

ARTHUR A. FINK.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 8-10.—St. Thomas, Ont.—Tournament of the St. Thomas Gun Club. Targets and live birds. Added money, and an international live-bird trophy. Under the management of Jack Parker.

March 15-18.—Utica, N. Y.—Tournament of the Oneida County Sportsmen's Association. Live birds and targets. Open to all. Henry L. Gates, Pres.

March 22-23.—Stanhope, Ia.—Central Iowa shooting tournament, for amateurs only. Gold medal representing Iowa championship. Manufacturers' agents allowed to shoot for price of targets and birds.

March 22-24.—Elkwood Park, Long Branch, N. J.—Interstate Association's sixth annual Grand American Handicap. 25 birds, \$25, birds extra; \$1,500 guaranteed to the three high guns; \$600, \$500 and \$400; all surplus added.

March 28-30.—Galena, Kans.—Interstate shoot. Two days targets; one day live birds; \$50 a day added. W. W. McIlhany, Sec'y.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Sec'y.

April 5-8.—Baltimore, Md.—Annual spring tournament of the Baltimore Shooting Association. Geo. L. Harrison, Sec'y-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 7-9.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting park, under the management of J. A. Corry.

April 8.—Bridgeport, Conn.—Target tournament of the Bridgeport Gun Club. J. G. Kingsbury, Sec'y.

April 13-15.—Atchison, Kan.—Manufacturers' fourth annual tournament. Added money later. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 19-22.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets: \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, manager. Address all communications to J. L. Head, Peru, Ind.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association, G. M. Walden, Pres.; Kansas City.

May 17-20.—Tournament of the New Jersey State Sportsmen's Association. T. H. Keller, Sec'y.
 May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.
 May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.
 May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.
 May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.
 June 8-9.—Findlay, O.—Annual tournament of the Magastrap Gun Club. O. B. Marvin, Sec'y.
 June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.
 June 14-15.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League of Indiana, on the grounds of the Limited Gun Club.
 June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.
 June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Blue-locks thrown free of charge. Professionals and manufacturers' agents barred from programme events.
 June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.
 June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the Sioux Gun Club. Three sets of traps. W. F. Duncan, Treas.
 July 19-21.—Palmyra, Mo.—Eighteenth annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Sec'y.

Wide-Open Shoots.

IN FOREST AND STREAM of last week Mr. G. M. Walden, president M. S. F. and G. P. A., enters with much spirit into a discussion of wide-open tournaments, and strongly advocates them. It is a very interesting subject. Concerning the Missouri State shoot, he announces that it is open to the world, excepting as a matter of course such events as are limited by local or special conditions, such as State shoots, individual championships, etc.

Everyone will concede the right of every organization to arrange its competition as it deems best. If the general and special conditions which pertain to it are such that it can give a better and more satisfactory competition if no shooter is barred, such conditions are quite the proper ones to recognize and adopt. It is the proper policy for any association to consider the legitimate support which contributes to its best success. But, granting this, we may ask if the special policy which is so beneficial to one is to be recognized as a rule for all? Hardly so. In fact, no individual club can make a cast-iron policy for even its own guidance year after year. Such changes are made year by year as experience shows to be necessary. It therefore may be assumed that the policy of any one club, based on its own individual interest, is not necessarily the best policy for all other clubs, nor permanently for itself. At the same time there must be some general principle of competition which will give the greatest satisfaction to the greatest number, and which will also be the most equitable.

In respect to paid shooters at tournaments, Mr. Walden touches more generally. He favors them as factors in tournaments, and cites as analogous certain other kinds of professionalism which, unfortunately for his argument, can hardly be considered as analogous. To better demonstrate the absence of analogy, his main points are quoted:

(1) "If I were in the sporting goods business I certainly would bar all professional shooters, for the following reasons: Everything in the line of guns, ammunition, shooting costumes, etc., is furnished by the manufacturers, hence he is a poor customer of the retail sporting goods merchant. If I were only an ordinary shot I would keep Mr. Good Shot away from all tournaments, in order that I may be able to earn a second-class gun or some article of merchandise hardly worth the freight or express charges home.

(2) "The amateur base ball team has for its audience the rabble, whose enthusiasm reaches out to the limit of the precinct of the ward in which the lot is situated, and on which they play ball. The same can be said of foot ball and other classes of athletic sports.

(3) "Except in isolated cases it's the 'way-upper' that we spend our money to see, that draws the crowds. Amateur theatricals live only for a night, and then only in the midst of its friends."

(1) The trade reason from the retailer's standpoint that the paid shooter pays nothing to him, nor to any one else for his guns, ammunition, shooting costume, etc., and therefore that he would be pleased to see the paid shooter barred, is quite in consonance with retail interests. The amateur views the matter in a liberal manner, yet also one reasonably consonant with his own interests. He buys his guns, ammunition, etc., of the dealer or manufacturer. It is he who supports the trade, as is quite proper, having received a valuable equivalent in return. However, the guns and ammunition, so paid for by the amateur, again afford a means of revenue to the paid professional, since in their use in competition they are engaged directly in line with the latter's business. The man who belittles shoots for pleasure can never equal in skill and success the man who shoots for business. The amateur, generally speaking, is such a performer as he may happen to be, an uncertain one at best, and one difficult to classify, owing to the irregularity of his performance. On the other hand, the paid professional must be a class man, one up to an extremely high standard of certain skill to secure, first, his position, and second, to hold it afterward. He within reasonable limits is a known, certain quantity in competition. His nerves are seasoned to steadiness before a crowd; his mind, eyes and hands are schooled to quickness and precision, and the problems of any flight of bird which can be offered him have been solved many times before. For him the merchandise shoot has little interest. He much prefers the cash events, and that there are such events proves conclusively that Mr. Ordinary Shot makes entries in them; that is to say, up to a limited number of times. He learns in time, to beat the Defender, that a common road horse cannot beat a trained racer; yet he may concede that, while it is plucky to try to beat them, it is bad judgment as well as expensive to attempt to do so.

(2) We fail to discover any analogy in the citation of competition between base ball teams. Let us make one. The amateur base ball teams are many times the schools from which the experts graduate. They afford pleasure to their respective groups. The professional teams engage in professional spectacular events, depending for revenue on the gate receipts. The spectators, non-professional, pay a fixed amount at the gate; securing a defined and fixed amount of pleasure in return, in which the professional has no part. Let us consider the audience as being amateurs. They are not in competition either directly or indirectly with the professionals. If they were invited to contribute \$1 at every inning, to compete with the professional or retire, and were they then given a short competitive run for their money, then there would be a true analogy. There can be no analogy in point between a group of men on the one side engaged in competition and another group on the other side not engaged in any competition.

(3) As to theatricals, they also fail in being analogous in any respect to the matter under consideration. They are simply spectacular and amusing, on a professionally business basis. The patron pays a fixed sum at the door for an evening's amusement, which is considered a full consideration for the amount paid. At no time is he in competition. If he were required to put up \$1 at the end of every half hour, in a contest in enunciation or expression or lofty tumbling with the performers, etc., he might plead that he was only an amateur and that he wanted to go home and there stay.

In regard to amateur tournaments, Mr. Walden has struck a good note when he mentions an equitable and intelligent handicap, although a rather difficult matter to secure. However, "my friend from the brush" with \$6 is hardly the true type of the amateur. He is no more a representative of a class than is the man who by pinching himself in respect to the necessities of life, saves \$5 to hear a Patti, etc., etc., a representative of the true class of theater or opera goers. The true class of trap-shooters is not found in a few paid men at one extreme, nor in the poverty-stricken men at the other. There are men in every thriving community who can set by \$100 or \$500 for the pleasure and recreation derived from trap-shooting. They form the rank and file of the trap-shooting class. In past years, in the transitional stage of guns from the muzzleloader to the breechloader, and in the use of nitro powders, the paid man served a useful mission as a teacher to the whole class of shooters. That time has passed,

The Hot Springs Tournament.

THE Hot Springs tournament was held last week, Feb. 15-19, under the management of John J. Sumpter, Jr., and Jack Parker. Owing to our going to press this week one day earlier than usual, on account of Mr. George Washington having been born on Feb. 22, we cannot give a full account of the proceedings at this shoot. Below will be found matter received from our correspondent Paul R. Litzke, up to the time of going to press:

First Day, Tuesday, Feb. 15.

It is rarely the case that the averages on the first day of a tournament run as high as they do on the succeeding days. Those made to-day proved no exception to the rule, as out of all the hot company present only three reached the 90 mark. There were abundant opportunities to scoop first money alone if there had been any one equal to the occasion. True there were some of the participants who accomplished this feat, but in three of the eight events no straights were made, while two men divided first money in the 25-bird event on 24. In this event Powers lost his 24th and Christianson his 23d, Fulford made the only straight score in No. 1, and Gilbert did the same thing in No. 7. Faurote was lucky in the first extra, as his was the only straight, Trimble being unfortunate enough to lose his last bird.

The table shows Gilbert first with 92.1 per cent.; Heikes and Fulford are tied for the next two positions with 90.3 per cent., followed by Faurote and Trimble, who are also tied for fourth and fifth places. These are the winners of the high-gun moneys, and but one of these belongs to the amateur class. Faurote made the longest straight run of the day, going 63 without a skip. This is not evidenced by the tabulated score below, as part of this run was made in the two extras that were shot after the regular programme. In these two events he made a 20 and a 19, which gave him 101 out of last 105 shot at. This was really the best piece of shooting during the day. The entries were not nearly as large as had been expected, forty-nine in all taking part, though of these forty shot through the entire programme, which would lead one to infer that those who are present have come to stay. The weather is just simply superb, and nothing could be asked for in this respect. The prospects are equally bright for the morrow.

Scores in to-day's events are:

Events:	Scores of Feb. 15.								Shot at	Broke	Av.

Lane.....	7	14	8	60	29	45

Second Day, Wednesday, Feb. 16.

The averages for to-day are much higher than those of yesterday, and the shooting done by some of the contestants was of a sensational order. Several long runs were made during the day, in this respect Heikes leading with 80 consecutive breaks to his credit. Gilbert has the nice run of 73, and Powers 66. Heikes dropped his first one in the 25-bird event, and then ran the remainder of the programme straight, as well as 16 more in the next extra. Gilbert made his run commencing in the second event, and winding up in the 25-bird event, wherein he lost rather early. Powers started in almost as soon as he got on the grounds. An extra was shot before the regular events were started; in this he lost the very first target he shot at, finishing with 19, and then ran 47 more straight in the regular programme. That first straight of his was also one of the lucky places of the day, as it netted him first money alone. Trimble too was fortunate, as he scored the only 16 in the third event, which paid him \$8.10.

In the 25-bird race there was some great shooting done, and the Indian squad ran up the great total of 121 out of 125, Budd and Loomis going straight, Powers and Gilbert got 24 and Parmelee 23. There were five straights and six 24s, and of these Martin lost his last bird.

Gilbert again took first average with .957, though Powers and Heikes, who were tied for the next two positions, ran him a great race, being only a single break behind with an average of .951. The next man is Budd with .927, followed by Elliott with .915. These are the five high guns for the day, which pays each of them \$4. There were forty-seven shooters taking part—two less than on the previous day—of which number thirty-nine shot through the entire programme, just one less than yesterday.

The weather was again fine, though there was some wind that occasionally made the targets erratic. Toward evening it was clouding up.

Tuesday's scores are as follows:

Events:	Second Day.								Shot at	Broke	Av.
	1	2	3	4	5	6	7	8			
Targets:	20	20	20	20	25	20	20	20			
Gilbert.....	19	19	20	20	20	24	17	19	165	158	95.7
Powers.....	20	20	19	18	18	24	20	18	165	157	95.1
Heikes.....	19	17	19	18	20	24	20	20	165	157	95.1
Budd.....	17	18	18	19	19	25	18	19	165	153	92.7
Elliott.....	19	17	18	18	18	25	18	18	165	151	91.5
McMurchy.....	17	17	18	20	15	25	18	17	165	150	90.9
Loomis.....	18	16	18	17	19	25	19	18	165	147	89
Trimble.....	18	16	18	17	17	25	19	16	165	147	89

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Grand Prix du Casino at Monte Carlo, which was shot on Jan. 28-29, was won by an Englishman who has been but little known at the traps until comparatively recently. Mr. Curling, the winner, first came into prominence at the meeting in Ostend last summer, and was hardly looked upon as dangerous in the Grand Prix, although he has done some good work at Monte Carlo this winter. The birds trapped in this event were a magnificent lot from all accounts; so good were they that 67 out of the 139 competitors in the event lost their first birds, the score in the first round showing 67 misses to 72 kills. This will sound remarkable to American trap-shooters, being but little over a 50 per cent. gait. But then Monte Carlo birds and Monte Carlo's conditions and boundary do not exist in this country. At the end of the 8th round there were only three possible straight scores out of the 139 shooters. One of the three dropped his 9th bird, while another dropped his 10th. This left Mr. Curling as the only possible straight, with two more birds to shoot at. Amid the greatest excitement he scored both birds and won about \$4,300 and a handsome silver trophy as the result of his 12 straight kills. The conditions of the Grand Prix are 3 birds at 26 meters and 9 birds at 27 meters. As a meter is about 39 1/3 in., 27 meters is 29 1/2 yds. Mr. Curling shot a Branquaert gun and Schultze powder. It is worth noting that the Grand Prix has been won eight times out of the last twelve shoots by a shooter using Schultze powder. The Branquaert gun is manufactured at Mont St. Martin, Liege, Belgium.

Mr. W. W. McIlhenny, secretary, in writing us concerning the Interstate shoot at Galena, Kans., mentions that "This shoot will take the place of what has heretofore been known as the Owl shoot of Missouri and Kansas, as the latter will not be held this spring. Programmes will be issued later, and the shoot will embrace two days at targets, with eight regular 20-target events each day, and \$50 a day added money; all moneys divided on the Ross system. The third day will be devoted to live birds, and in addition to sweeps the third open contest for the Kansas State wing shot badge will be held. The Galena Gun Club grounds are well fitted up and the club will endeavor to make this a pleasant occasion to all visitors."

Capt. A. W. Money won the first prize gold watch put up for competition by the Boiling Springs Gun Club, of Rutherford, N. J. The club puts up one watch every two months, shoots being held twice a month, on the first and third Wednesdays of every month; the shooter winning the watch the greatest number of times out of the four shoots takes the watch; in case of a tie there is a shoot-off. Capt. Money won the first two shoots in January; the president of the club, Mr. E. A. Jeanneret, won the third contest, Mr. J. Gerow Dutcher winning the fourth and last shoot on Feb. 16. Thus Capt. Money, with his two wins, took the watch. A new series commences on March 2. The conditions are 50 targets per man, \$1.25 entrance, handicap allowances. Anybody is welcome to shoot for the watch, the contest not being one "for members only."

As an international affair in every sense of the word, the Grand Prix ranks second to none. The following figures show the different nationalities represented, and the number of each nation's representatives: 45 English, 40 Italians, 30 French, 7 Belgians, 6 Austrians, 5 Germans, 3 Russians, and one each from America, Turkey and Spain. The American representative was Mr. W. Rogers, who lasted only until the fourth round, when he retired with one kill to three misses. Among those who missed their first 3 birds was M. Journu, the celebrated French shot, who won the Grand Prix in 1896. Sixteen shooters in all missed their first 3 birds.

Jack Parker's recent records at live birds are worthy of note. Here are some figures on them: On Jan. 15 he scored 32 out of 38 on the Post street grounds at Detroit; at the Hamilton tournament he totaled 56 out of 58 shot at; at the Old Reliable grounds, Detroit, on Jan. 29 he ran 34 straight, and at the same place on Feb. 5 he ran 42 straight. All these birds were shot at in miss-and-out events, with the exception of some of the birds shot at during the Hamilton, Can., tournament. His grand total shows 164 out of a possible 167 consecutive birds. Of course after doing the above excellent work, he wants us to mention that he did it with King's Smokeless and Peters' Victor shells.

Aaron Doty, of Paterson, N. J., is shooting very well just now. In a 25-bird race at the grounds of the Lyndhurst, N. J., Shooting Association on Thursday, Feb. 17, he was the only one to score 25 straight, killing some very good birds indeed while running up that total. He was placed on the 29yds. mark. Jack Brewer scored 24 out of 25 from 31yds. mark, his last bird being literally chased out of bounds by poor retrieving. Ferd Van Dyke, 29yds., scored 23 out of his 25 and took third money, the three mentioned taking all the money there was in the pot, something over \$100.

Louis Harrison, of Minneapolis, Minn., is in this city, and promises to make one of the entries in the Grand American Handicap. Mr. Harrison is very popular with the boys, and is renewing old acquaintances as well as making lots of new ones. He took part in the monthly shoot of the Emerald Gun Club on Feb. 15, and killed all 10 of his birds; his eighth bird, however, fell dead out of bounds, his total score being 9 out of 10.

Frank M. Faureto, of Dallas, Texas, is one of the very best target shots in the South. He showed this very conclusively on the first day of the Hot Springs shoot, Feb. 15, by running 63 straight in the sweeps. Mr. Faureto has done a lot of good shooting in the past, but on this date he was pushing everybody very closely, landing a tie for fourth and fifth daily averages with Ralph Trimble, of the Du Pont Powder Company.

Manager John S. Wright is already figuring on the Brooklyn, N. Y., Gun Club's all-day shoot at targets on March 10. The programme will be arranged so as to suit the shooters who always attend these popular gatherings in goodly numbers. Special prize events with handicap allowances will be features on this occasion. An awning is to be erected permanently over the score at the club's grounds, thus permitting shooting in comfort at any time, rain or shine.

A. H. King, of the Herron Hill Gun Club, Pittsburg, Pa., shot a race with his fellow member C. S. Guthrie, on the club's grounds, Feb. 11. The conditions were 100 birds per man, \$100 a side. King took the lead from the start and was never headed, winning by 3 birds with the score of 89 to 86. The pigeons are said to have been the fastest lot ever trapped on the club's grounds.

The Hunter Arms Co. have made a somewhat radical change in the manufacture of their guns which will be of interest to the general shooting public. In their No. 2 guns crown steel will be used, with an option on Damascus, and No. 3 will have their new material, called nitro steel, a composition which they assure the public comes nearest to Whitworth Fluid steel of any gun offered.

It is getting very close to the dates for the Interstate Association's Grand American Handicap at Elkwood Park, March 22-24; only four weeks more. Entries will close three weeks from Thursday of this week; shooters should not fail to keep this fact prominently before them. Post entries cost \$10 extra—that is, \$35 instead of \$25.

The next big tournament of note in the East is the Oneida County Sportsmen's Association's tournament at Utica, N. Y., March 15 to 18. Both live birds and targets will be trapped, the E. D. Fulford system of under-ground trapping for live birds will be used at this tournament.

The Providence Gun Club, Providence, R. I., elected a list of officers recently as follows: President, P. H. Randall; Vice-President, H. W. Bain; Secretary, J. F. Russell; Treasurer, R. C. Root; Captain, S. E. Wilson; Directors: O. M. Staniels and E. C. Whitaker.

The many friends of Mr. Geo. W. Work in this vicinity have missed him from among their ranks for some time, and many are wondering as to what became of him. He is at present enjoying the shooting about Phoenix, Ariz.

The regular shoot of the Mount Vernon Gun Club, 8 East First street, Mount Vernon, N. Y., will be held at Pelham, on Feb. 22. Four events are on the programme, one sweepstake at 15 targets, four moneys. Three handicap sweeps, 5, 10 and 15 birds respectively.

There will be a live-bird shoot at Flemington, N. J., Feb. 26. One event is a two-men team match, entrance \$25. Birds 15 events.

Among the visitors to New York last week was W. F. Tappan, of Altoona, Pa. Years ago Tappan used to travel the Jersey meadows around Newark and score heavily on the English snipe that haunted there. Later he moved to Altoona and took a position in the Pennsylvania Railroad Company's shops, and that are to be found in the woods of the Alleghenies. He also waged a consistent and effective war on the ruffed grouse ports that last season was one of the best he has known for grouse; and also told how he and Jack Killits secured in the neighborhood of thirty woodcock and a few "pheasants" in a few hours one day in the vicinity of Claysburg, Pa. Altoona can boast of many good brush shots, but Tappan has always been somewhere near the top of the list.

Mr. T. H. Keller, secretary of the New Jersey State Sportsmen's Association, under date of Feb. 19, has sent out a circular to members, as follows: "A meeting of the directors of the New Jersey State Sportsmen's Association will be held at the rooms of the Sportsmen's Association, No. 377 Broadway, New York, on Monday, Feb. 28, at 2:30 P. M. You are requested to send a representative of your organization, as matters of importance to the future welfare of the Association will be discussed. If your club has any proposition to offer in reference to holding the annual tournament, be prepared to offer same. There is no reason why New Jersey should not have as prosperous a State organization as any in the Union. Won't you come and help boom it?"

A series of three 100-target races has been arranged between T. W. Morfey, of Lyndhurst, N. J., and Chris Wright, of Paterson, N. J. The conditions are Sergeant system, 100 targets per man for a consideration, and loser to pay for the birds. The first match will be shot at Bunn's grounds, Singac, N. J., on Feb. 28; the second match will be shot shortly after the above date on the grounds of the new Lyndhurst Shooting Association, at Lyndhurst, N. J. After the above two matches have been shot the toss of a coin will decide where the third and final match shall be shot.

Noel Money did not get beyond the fourth round in the Grand Prix at Monte Carlo. He scored one out of his three birds from the 26 meters mark, but lost his first bird when moved back with the rest to the 27 meters mark, according to the conditions of the Grand Prix. He had plenty of company, however, and much of it quite hot company, as twenty-eight men dropped out in the same round with three misses out of the four birds shot at. Among the number was Signor Guidicini, the celebrated Italian shot, who won the Grand Prix in 1886, '90 and '93; Signor Calari and Signor Grasselli.

The Maryland Handicap, one of the live-bird events scheduled for the tournament of the Baltimore Shooting Association next April, will have \$500 guaranteed by the club as usual. The conditions will be 25 birds per man, \$25 entrance. The Association will add \$200 in cash to the purses in the target events.

The daily averages for the first day at the Hot Springs tournament, Feb. 15, went to the following: Gilbert first, Heikes and Fulford second and third; Faureto and Trimble fourth and fifth. Fulford and Gilbert each made two straight scores of 20, each man getting first money alone for their straights.

The Savage Repeating Arms Co. has been reorganized under the name of the Savage Arms Co., and is incorporated under the laws of New York. They contemplate building and equipping a suitable plant for the manufacture of rifles and ammunition.

The J. Stevens Arms Company, of Chicopee Falls, Mass., has its New York office in the store of Messrs. Von Lengerke & Detmold, 318 Broadway, New York city. The office is in charge of Mr. Whittemore.

The programme of the Bridgeport Gun Club's all-day tournament, April 8, provides for twelve events at targets. Four moneys in all events, 40, 30, 20 and 10 per cent.; \$15 added money.

For More Varied Styles of Shooting.

WORCESTER, Mass., Feb. 15.—*Editor Forest and Stream:* After reading your article "For More Varied Styles of Shooting" I am willing to put the chip on my shoulder.

I believe that if the shooter that shoots for records could produce better ones than his rival at swift-thrown birds and sharp, hard angles it would go further toward convincing the public that he had a better product in gun or ammunition than the scores made at the two easiest systems of shooting known, namely, "known traps and angles," and "known traps and unknown angles."

I have noticed in some of the scores at tournaments that some of the best shooters have dropped out of some of the events of the programme. I can only guess at the reason, but consult the programme and you will find the events they did not participate in were "reversed," "expert," "pairs," or the "one-man-up system."

Now a good shooter will average at "regular" and "unknown angles" about 90 per cent.; at reversed 86 per cent.; one man up 84 per cent.; doubles 80 per cent.; expert 78 per cent.—this with the best gun and ammunition.

Give any of the shooters who could make that per cent. at that class of shooting an inferior grade of ammunition and you would not lower his per cent. near so much at the regular and unknown angle systems as you would at the others. And I think that the systems of shooting are so well known by most of the shooters that a high score at easy shooting is no great proof of good ammunition.

I know that the high scores look well in print, but let us have some good sport while we shoot.

As I am the father of the reversed system, I will speak for that first. It is the most difficult, single-bird, known-angle system in use for amateurs; but after the expert gets used to it it becomes easier. For each day's shooting about one-quarter of the programme ought to be the reversed system.

Best of all shooting (both for the shooters and the spectators) is the one-man-up system, unknown traps, regular angles; perhaps not so good for the target and ammunition dealer. But still I am inclined to believe that if this style of shooting was used more we would have more shooters at the traps. I should like to see every programme for the next six months with more than half of the events on them of the more difficult system of shooting, and I think it will improve the interest and attendance at tournaments.

Now, boys, I know I lay myself liable to get hit, but when trap-shooting gets as low as it is in Massachusetts let us say something and also do something.

I have not attended any of the large tournaments of the Middle and Western States, but I expect to before another year passes, and I should like to see them run on different kinds of shooting, and let all tournaments be open to anybody that sees fit to enter the sweepstake events. I hope to hear from many in the interest of more difficult styles of trap-shooting.

A. W. WALLS.

The Sergeant System.

IN response to a request that has been made to us we give below a description of the Sergeant system as we understand it:

Three expert traps are used in this system of trapping targets, the traps being generally set a yard apart. It will be found better, however, to set the traps at least 1 1/2 yds. apart, as this enables the trapper boys to do far better work than when the traps are closer together, besides doing away with a great deal of danger to the trappers themselves from traps springing and hitting them. Although we cannot speak positively as to whether or not Mr. Sergeant meant each trap to throw unknown angles, we believe that the most satisfactory method of throwing unknown angles from these three traps is for the boys to change each trap either every time or quite frequently; the latter course is preferable, as it keeps the shooters "guessing" better than changing them every time. When traps are set at regular angles for this system a close watcher of the targets just thrown from the traps can tell just what flight to expect, thus making the system really "known traps and angles" to him.

The positions of the shooters are marked off in a segment of a circle that has a radius of 16yds., the distance being measured from the center trap. While this brings Nos. 1 and 5 in a squad rather nearer the outside traps than it does the men at the other scores, the men on the corners find the sharper angles much more difficult to negotiate than if they were standing in the middle. The positions of the shooters are in fact the same as when shooting over the magautrap, this style of shooting giving much the same angles as the magazine trap does.

The system was devised by Mr. G. W. Sergeant, not Sargent, of Joplin, Mo., to facilitate fast trapping at tournaments, and there can be no question as to the success of his plan. There is practically no delay should a target break in the trap; the shooter again calls "Pull," and away goes another target; there's no waiting until the trap is loaded.

A specially advantageous feature of the system is that it does

away with at least two trappers, while two husky boys of say, sixteen or seventeen years old can easily attend to two traps at any ordinary club shoot, and can give better satisfaction than any five trappers can do under the older system of five expert traps.

There is, however, one objection to the Sergeant system in our opinion: There is only one style of shooting that it suits satisfactorily, viz., known traps, unknown angles. Doubles or pairs are much easier under the Sergeant system than when the traps are 5yds. apart; this stands to reason, as anybody can see at a glance. Again, you can't shoot expert rules, one man up, from only three traps set 1 1/2 yds. apart. Also you cannot shoot reversed order. And there you are. It is just the one style of shooting; the style that is the most expensive, because it's the fastest.

ON LONG ISLAND.

New Utrecht Gun Club.

Feb. 12.—To-day being Lincoln's birthday, and also the regular semi-monthly live-bird shoot of the New Utrecht Gun Club, there was a good attendance of members of the club, despite the heavy rain of the early part of the day, and the thick fog that held sway until the afternoon was at least an hour old. J. Gaughen was in great form, and captured the two cups with 26 straight kills. He did not win either cup without a struggle, having to kill 6 straight in the miss-and-out shoot-off for the Lincoln cup, and 3 straight in a similar shoot-off for the special cup, three others being tied with him on 10 straight in the latter event. The runner-up for the Lincoln cup was D. C. Bennett, who shot well, but with poor luck, all the day. He scored in all 35 out of 38 birds shot at, but lost birds just when he wanted them badly and when a kill would have counted. Scores were:

Lincoln Cup.	Ties.	Special Cup.	Ties.	Prize Shoot.	Ties.
J. Gaughen.....2222222-7	122222	29..1222221221-10	111	28..1022

JOHNNY JONES.

Emerald Gun Club.

Feb. 15.—The Emeralds had a big turnout at their monthly live-bird shoot, held this afternoon at Dexter Park. Thirty members and three guests took part in the shoot, three of that number getting clean scores. These three were: D. O'Connell, 29yds.; E. J. Clarke, 29yds., and W. Sands, 28yds. Among the guests was Louis Harrison, of Minneapolis, Minn., who scored 9 out of his 10, the bird he lost being a screamer that fell dead just over the boundary. The birds were a good lot, and made the men shoot well to make good scores. Below are the records of the day:

Club shoot, 10 live birds per man:		
J Roberts, 25.....2211200200-	6	B Amend, 28.....1010221110- 7
J H Swan, 28.....1112222220-	9	T Short, 28.....22211*2010- 7
H Meyer, 25.....0220001102-	5	W Joerger, 28.....12111*2122- 9

Dansville Gun Club.

DANSVILLE, N. Y., Feb. 11.—The Dansville Gun Club held its regular practice shoot to-day. The day was all that could be desired. A large number of spectators witnessed the shooting.

The enthusiasm of the members is unabated, and the shoots are well attended.

Several of the members have provided themselves with new guns, and each is trying the various combinations of shot and powder to find the load particularly adapted to himself. The improvement in shooting is encouraging, as the following scores will show; the average for the day's shooting has risen from 42 per cent. Jan. 14 to 56 per cent. made to-day:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	10	10	10	10	10	10	10	10

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY, {
SIX MONTHS, \$2.

NEW YORK, SATURDAY, MARCH 5, 1898.

{ VOL. L.—No. 10.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

A woodsman may blaze his way through the trackless forest, but he leaves the gash on the tree as a sign of his course, while the gypsy can travel a thousand miles and leave no sign that any eye but a gypsy's can see, and yet the route he has gone is perfectly plain to the laggard who follows a day's journey behind. Gypsy has followed gypsy hundreds of miles, day after day, guided only by the patteran—the mark at the cross-roads. The patteran is sometimes made of a handful of grass, sometimes of a heap of sticks placed with significance, sometimes of a pile of loose stones so arranged that they show the way the wanderers have taken. Different families have usually a different form of the patteran, but all know and rely upon it.

Paul Kester.

FLORIDA AND MAINE.

In his paper on "Florida Fish and Fisheries" Dr. James A. Henshall contends for the appointment of a competent Commissioner to promote the fishing resources of the State. The plea is well considered and reasonable. In this day no State possessing fishery interests of the magnitude of those of Florida can be considered abreast of the progress of the age if it fails to control those interests by wise regulations and to foster them by the direction of intelligent fishcultural experts. Florida should have a Fish Commission; if a single-headed one, so much the better. Gov. Bloxham, having displayed such interest in the subject of the fisheries and their protection, may be relied upon to urge the Legislature in the next session to create a Commission.

The Legislature should not stop here. Florida stands in need not only of supervision and control of its fisheries, but supervision and control of its game resources as well. The game protective doctrine promulgated by Commissioner Carleton, of Maine, may have sounded strange in Tampa, but it was eminently sound and sensible. Maine and Florida, the one at the extreme north and the other at the furthest south of the Atlantic seaboard, are separated not more widely geographically than in the wisdom and the folly of their respective courses with regard to game protection. Both have incalculable pecuniary interests involved; in Maine and Florida alike vast revenues are derivable from tourist hosts, attracted in large measure by the opportunities for shooting and fishing. Twenty-five years ago Florida was more famous than Maine as a game country; the quarter-century has witnessed the increase of game in one State under a provident system of protection; and in the other practical extermination over wide areas, because of wanton, unrestrained and fatuous killing. What might have been a permanent and profitable attraction has been recklessly destroyed.

It is customary to lay the blame for this upon the original, native, way-back Florida cracker, who without a qualm kills game in the breeding season and makes venison of does heavy with fawn; but paint him black as one will, it is yet to be said for the Florida cracker that he does not kill in wantonness. Nor indeed has his hunting taxed the resources of the State in any degree which begins to compare with the destruction wrought by his detractors. If the resident Floridian, who should have known better, and the tourist gunners from the North and West, had been restrained, even within the simple bounds of decency, there would have resulted no such dearth as now prevails.

We never heard of Florida crackers fishing for the sake of making a bigger catch than some other fisherman; nor shooting a big bag of quail for the sake of bragging that he had slaughtered more than some other shooter. The seine fisherman and the big bag gunner are found among an altogether different class. They

are creatures of idle hours and ignoble ambition, whose petty pride it is to see their names in the society journals prefixed to such records of fish and game killed as a sober and sensible person should be ashamed of. The hotels encourage this purposeless and wicked destruction by proclaiming the perpetrators of it as heroes who have achieved noble deeds.

NATIONAL PARK TRANSPORTATION.

In our issue of Feb. 5 we took occasion to criticise adversely the management of the business conducted in the Yellowstone National Park by the Wylie Camping Co. This has brought to us in reply communications which are printed on another page. The writers contend that the conditions upon which our strictures were based do not exist, and that in consequence the FOREST AND STREAM has not fairly represented the character of the Wylie enterprise.

These statements of our correspondents evidently coming to us in good faith, and being accepted as correctly stating the conditions as they exist, it is manifest that our remarks were based upon a misapprehension of the facts in the case. For transportation and camping facilities conducted as our correspondents assure us the Wylie business is carried on there is a well-recognized place of usefulness in the Park. They unquestionably fill a public need, and should in every way have encouragement, being subject to the same control and supervision by the Superintendent of the Park as are now exercised with respect to the hotel and stage companies, and being conceded by the authorities at Washington and in the Park corresponding privileges and opportunities. Whatever agency makes the National Park in actual realization what it is in theory, the pleasure ground of the people and of as many of the people as possible, is commendable. As was stated in the article referred to, we believe that there is room for just such a business, where the rates charged shall be less than those demanded by the regular transportation and hotel companies. The people who visit the Park are of many classes, and have varying depths of purse. There should be accommodation for all.

Having cheerfully accepted the good faith of our several correspondents, we need hardly add that nearly twenty years devoted to a successful defense of the public's interest in the Yellowstone Park has established the position of FOREST AND STREAM so firmly that no one familiar with this journal needs any explanation of its motives. During these years we have had frequent occasion to point out their duty in connection with the Park to high Government officials, to wealthy corporations and to individuals of all degrees of standing in the community. In doing this we have been governed by a single motive, the best interests of the public, to whom this wonderland belongs.

SNAP SHOTS.

ON Tuesday last, March 1, the forest reservations passed under the care and direction of the Secretary of the Interior. Mr. Bliss is deeply interested in this subject, and may be trusted to do all in his power to set on foot before long the beginnings of a forest service which will be immediately useful to a large section of the country. During the year that has passed since the forest reservations were set aside, public sentiment in their favor has steadily grown, and we believe it will continue to grow. During this year, too, there have not been wanting efforts to remove from some of these reservations everything on them that was of value; but it is to be hoped that with the organization of the forest service such efforts will cease forever.

Mr. Stark's experiences of foxes and game is that of many another man who has spent much time out of doors in New England woods. No one doubts that a fox is willing to capture game birds if he can, but also no one doubts that a fox or any other predatory creature will live chiefly on that food which is most easily obtained. Except in the breeding season—when the foxes no doubt destroy some ground-nesting birds and their broods—the food of the fox may be presumed to consist almost wholly of mice, varied occasionally by squirrels, and still less often by rabbits. On more than one occasion we have seen where a fox had captured a gray squirrel while he was digging through the snow for

nuts, and an old fox hunter of our acquaintance actually witnessed such a capture, and then secured the fox. It must be remembered that for ages the fox and the game birds have been carrying on their warfare just as they are carrying it on to-day, and yet the balance of nature was well enough preserved, and both foxes and game were plenty until man came to have a gun and to know how to use it. When this came about the destruction of game by foxes at once became insignificant by comparison with that wrought by man; so trifling, in fact, as not to be worth considering.

The quaint picture of Florida deer hunting is from the pencil of Jacques Le Moyne, the French artist, who accompanied the expedition of Laudonniere in 1564, and whose illustrations of life and nature as he found them in the strange new world were published in one of De Bry's series of voyages, at Frankfort-on-Main, in 1591. The engraving has been reproduced for the FOREST AND STREAM directly from the three hundred years old original. It was a hunting custom with the inhabitants of Florida, Le Moyne tells us, when they stood in need of venison, to clothe themselves in the skins of deer, and repair to the streams where the unsuspecting game came to drink. The game of those days must have been less circumspect than the Florida animal to-day, or the savages were more expert in their masquerading. It would defy the skill of the craftiest white hunter of this age to assume a deerskin disguise and approach game in the open as these Florida Indians are represented as having done.

The relations between men and animals at that time were very different from those of to-day. With his fewer wants, his crude weapons, and general helplessness, the Indian was not a formidable enemy of the wild creatures. He played but meager part in reducing the stock. The old chronicles are filled with accounts of the wonderful supply of furred and feathered creatures everywhere found in the southern country; while, if one may believe the narratives of the explorers, the crocodiles (known to us as alligators) were so numerous as to be a continual menace to man; so much so, Le Moyne averred, that the chief concern of some of the tribes was how they might defend themselves from falling prey to these reptiles.

Mr. Lacey's bill to add game propagation to the scope of work of the United States Fish Commission has been favorably considered by the House Committee on Marine and Fisheries, whose report is published elsewhere. While the work of game protection and game importation and restocking belongs legitimately to the several individual States concerned, it would be difficult to discriminate between the principle here involved and that which controls the practice of the Fish Commission with respect to fish, or of the Agricultural Department with respect to the distribution of seeds. If the Government collects fish in one State and gives them to another State, no good reason suggests itself to forbid the collection of birds in one State for transfer to another.

The special interest of the current report of the Massachusetts Rod and Gun Club, which is given on another page, lies in the fact that it records actual work accomplished. The club is composed of members who are personally and actively interested in game protection to the extent of contributing money and effort and time to actual endeavors to execute the laws. Their chief attention has been given to abating the grouse snaring which has long been an established industry in Massachusetts. The club detective has destroyed many miles of snare lines, and arrested and brought to conviction the snarers. Quietly and without any blowing of trumpets the club has broken up the traffic in snared Massachusetts game. It deserves cordial and substantial support.

The sentiment that it is not all of fishing to fish nor all of shooting to shoot is one which sounds well when interjected into a record of success in the field; but gives sorry comfort in alleviation of the disappointment and chagrin which crown an utterly barren enterprise with rod and gun. When one goes for game or fish he wants something tangible to show for it; that is, unless he shall be content to dodge all his shooting friends, or to cultivate the arts of deceit and dissimulation.

The Sportsman Tourist.

Down in the Sac and Fox.

I HAVE noticed that when a man tells a story that is rather of a joke on himself, and that the average man would not tell because he would be a little ashamed of it, that it is more generally read than a very decorous Sunday-school tale about a good little boy who went to a picnic, and when he found a potato bug in his pie immediately ate it so as not to offend his dear teacher who made the pie. No, I was not the good little boy, and I didn't eat bugs, but I had quite a time down at the Sac and Fox opening.

The opening of the land that belonged to the Sac and Fox tribe occurred, I believe, in the fall of 1891. I got word on the 7th that it was to open on the 10th, and went at once to Guthrie, Okla. Ter., with \$25, an overcoat, a blanket, a .45 six-shooter and a plug of tobacco. I had long before exhausted all my rights to take up any of Uncle Sam's land, and the only chance I had to take up anything legally was to get a city lot or two in the town to be of Chandler. Ten thousand of us rushed in at the hour of 12 noon on the 10th, at a breakneck pace, on horses, mules, road carts, buggies and old wagons. Away we streamed, a mad mob, through jack oaks and over gullies where many a bold rider came to grief; and at last my party of four landed at the edge of the town site, to be told that the opening was to be postponed ten days, as the survey was not finished. We saw that we were in for it, and at once made a camp near water; surrounded a piece of ground about 80 ft. in diameter with a ball of white cotton string drove inside and unhitched our old buggy, which we had hired in Guthrie at \$10 a day, and unpacking our rather scanty cooking kit, proceeded to settle down and keep house under the greenwood tree. That night, and for the next ten days, 10,000 men and a few women camped there; and what times we did have, to be sure. One of our party wrote:

FIFTH AVENUE HOTEL,
Dodge City Headquarters.

on a piece of dirty white cloth, and in two days our acquaintances had found us, and came and camped inside the white cotton string—about twenty in all. And it was funny. Short of cooking utensils, short of grub, few blankets, no tents, and lovely weather. I ran out of money. It was forty-two miles from Guthrie, and so I borrowed \$5 from a friend. Two years before this we had been in a county seat fight on opposite sides. One day the two towns had a heated discussion with guns, in which we were both engaged, and exchanged half a dozen shots at 200 yds. with Winchesters. Very fortunately we didn't hit each other. There was a slight coolness between us for six months, and then we met and made friends, concluding that the war was over; and we have been all right ever since.

My private party sent back the old carriage the second day, to save expenses; and there we were. There were several horses left in the headquarters, however, and we could get a mount when we wanted it. I took care of an old pony for a friend who had gone to Guthrie with our living team; so I was all right.

The camping ground was a broad valley, dotted with trees between two low hills. It was a beautiful sight at night to see the camp-fires. There were generally one or two evening meetings going on, and the air is so heavy down there that we could hear everything as distinctly in our camp, 400 yds. from the nearest meeting, as if we were close to the preacher.

One morning I went down to a pool of water in the bed of Cowskin Creek to water my pony. The pool was right in the center of the camp of 10,000 people, who had been there at least a week. I noticed a dimple on the water, as if a fish had risen for a fly. It didn't look like very fishy water, but I concluded to try it. I got a hook after hunting around among the camps a little for it; made a line out of black thread, doubled twice, got a grasshopper and tried it; and, oh! the fish—cats that weighed about a pound; black bass from half a pound to a pound or two, and great big sunfish that came out flopping and glistening with all the colors of the rainbow. I had fished perhaps fifteen minutes when another man came to water his horse. When he saw me flipping out the fish he looked surprised, and said: "I didn't know that there were any fish here." I told him how I had found it out, and he immediately asked the loan of hook and line. I only had one, and told him so; so he bolted off to get fishing tackle. Before he got back at least five other men had seen me, and within half an hour there were 100 men fishing at the pool. The pool was 50 yds. long and 10 wide, but I think every man got a fair mess of fish. That day I got as much as I could conveniently carry, say 60 lbs., and that night the Fifth Avenue Hotel had fried fish and some for breakfast. But the pond was skinned. There were always two or three men fishing in it whenever I went down to water the pony, and they seldom had anything.

Then grub got very seldom at the Fifth Avenue, and I had only \$1.50, and most of the boys were broke or said they were. My sleeping mate was very blue one morning at breakfast, which was quite light, and reviled the country, the United States Government, and in fact everything; and declared his intention of stealing a horse that night, of riding into Guthrie and going home from there on the cars as blind baggage, reserved seat. I told him that if he would not be rash he should have a good breakfast the next morning and some money to go home with, if he wanted to quit. He asked where the money was to come from, and I told him I would make it somehow, though I didn't have the slightest idea how. It took me about two hours to figure out the situation, and then I went to Buff and unfolded my plan and declared him in and my partner. He promptly declared himself out again, and said I'd get killed. I told him that I would take all the risk, and that I only wanted him for tent doorkeeper. But he wasn't game enough, and I had to get two men. My plan was to shave off my mustache, black up, put on an old calico

dress, and having a tent for a night to tell fortunes as the Witch of Cow Creek, 192 years of age, and the fourteenth daughter of a fourteenth daughter, who still exists and has an equal knowledge of the future and the past. I have no particular mode of telling fortunes, but when I went to the Gunnery School in Washington, Conn., I fortunately had a good deal of experience in acting in what were called impromptu charades—made and acted while you wait—and I concluded to take chances. My boy, if you had seen those people—rough, dirty and many ignorant. It was a good field for a fake, but it would have been death to be caught. I had seen a very good-looking girl camped near the East Spring, with her sister and her sister's husband. Their names were Cooley, and they were from Guthrie. The young lady was tall and finely developed, and as pretty as she was big. So I went and made a talk to her, and told her I wanted to buy an old wrapper. I told her, under promise of secrecy, what I wanted it for. She called her married sister, and I had to rehearse my tale to Mrs. Cooley, who, by the way, still lives in Guthrie, and does not know my name. She looked at me a moment, and then said: "The man is all right, Clara; sell him an old dress." She sold me a pink Mother Hubbard for \$1, and then rather timidly asked me what I was going to do with my mustache. "Shave it off, of course," I said. And she said, "Oh!"

I tore open the cushion of a buggy and got some curled hair and made a wig; bought a pair of women's stockings, and hired a tent from a man for the night for \$1, to be paid in the morning, and got an old pack of cards, a saddle blanket and a candle. Then I wrote a sign on cotton cloth: "Cow Creek Witch. Reads Past, Present and Future. Your fortune told for \$1." And now, with a doorkeeper and a booster, I was ready for action. Off came the mustache. I blacked up; rolled up my pants and put on the stockings; slipped on the dress and wig, surmounted by a red handkerchief, turban fashion; lit the candle and squatted on the blanket, awaiting callers. And they came. I satisfied most of them; and there were 107. But at last in burst the booster with: "Run, Dick! here come a lot of those Arkansawyers, full of whisky, to hang the witch." I stayed not on the order of my going, but went at once, out under the back of the tent, first putting out the light. I rolled my Mother Hubbard under my arm as I imagine the patriarchs of ancient times did when they got caught stealing melons from the Gentiles, and flew up the road for the Fifth Avenue. When I got there my doorkeeper and booster were both in bed. They must have flown, for I ran.

I sent two other men down to rescue the tent. The mob had it torn down, and my friends claimed it and put it into a drug store. In about an hour Hall, from Beaver City, and I went down and got it. The night was so dark that I lost my way, got in among a company of soldiers and was arrested for a horsethief. I talked out of it and at last got to camp. It commenced to rain soon after I got there, so we put up the tent, and all slept in it. The man who owned the tent came around in the morning in an awful stew; he thought his tent was torn up. I bought it, paid my boosters, gave Buff \$15, sent him home; and when we ran into town got a lot that was not worth over \$5. I saw the young lady with her brother-in-law and his wife, riding past next day, and she recognized me and pointed me out; but I dodged, and Mr. Cooley has never seen me. I am not going to take off my gun and do myself up in an old red dress to act again for such an unappreciative audience without a better bodyguard.

I told every man who consulted the witch that night that there was a woman he had promised to write to, and that because he had not done it she was feeling badly. I knew that was so, for I had promised to write to my wife and had neglected it. Every one slapped his leg and said: "By gum, that's so." And the postmaster said that the mail was twice as large as usual the next morning; but he would not divide the cancellation with me, though I asked him politely. W. J. D.

Just About a Boy.—VI.

THE sky was gray and dull, hanging like a sheet of lead over the world, and there was a "snowy feel" to the air that seemed the forerunner of a storm. Sounds were muffled and subdued, and there was a waiting air over everything.

The boy came swinging around the corner, his coat wide open and hands deep in the inner recesses of his cavernous pockets, as he strode along whistling merrily and glancing upward occasionally.

"Say," he said, as he saw me, "goin' to have a trackin' snow to-night. Less go huntin' to-morrow, will yeh? I know where they's a lot of quails 'n' cottontails 'n' jacks 'n'—maybe a few chickens. Can't tell for sure 'bout the chickens 'cause they don't stay much in one place in the winter, nen they're pretty cute too 'n' hard to get up to. 'But the quails 'n' the rest are all right, 'n' we can get all we want. Will yeh go?"

"Yes, if it snows I'm with you," I answered, for I felt like taking a trip with the gun, and was glad of any excuse that offered.

"Where'll we get a dog?"

"Huh! don't want no dog," the boy said, disdainfully.

"Dogs is a nuisance. They run around soss yeh can't git a thing 'less yeh juss happen to. I'll show you more game 'n you can shoot, all right, an' I don't want a dog neither. Take lots o' shells 'n' be ready for all day 'n' we'll go over among the brakes by Stoll's place. Some good ground over there 'n' we can have a bushel o' fun. I'll be ready 'bout half past seven 'n' come this way."

"All right, I'll be ready," I answered, and the boy said, "So long," as he disappeared in the fast-gathering darkness.

When morning came there was a fine tracking snow on the ground, and the boy and sunrise came together. We shouldered our guns and plunder and hurried through the half-awake town, across the river and into the corn-clad hills, where the brakes ran back to the divide.

"We'll go over along that hedge first," said the boy. "You take one side 'n' I'll take the other, 'n' we ought to get a cottontail er two. Yeh see, they ain't went to the brush, 'n' they're kind o' hangin' 'round their summer stamping grounds yet. When the snow gets a little deeper they go to the brush and weed patches 'n' cornfields, nen you got to hunt different. Look out now which way yeh shoot, 'n' don't shoot at all unless yeh know where I am, 'n' I'll do the same."

We walked along for a few hundred yards before the boy said, "Woap, I see one!" I stopped, and his gun boomed, tearing up the snow at the foot of the hedge where a lot of "tumble weed" had blown up and lodged against it.

The rabbit was killed sitting in his form, and as the boy went to pick him up a bunch of quail whirled up a little further ahead and went on down the hedge, pitching to the ground again within a couple of hundred yards.

"Gee!" said the boy. "Now we're goin' to have a picnic, sure! They lit in the hedge an' they'll get up scatterin', so we can have wing shots at 'em one at a time. That's the way I like 'em. Now you take the ones that get up on your side an' I'll take care o' the ones on this side, 'n' we'll have some fun. Look out for tracks too, 'cause some o' 'em may run out in the grass. Ready?"

"Yes, so ahead," I answered, "I'm with you."

Slowly we went to the place where the birds had pitched down, and suddenly "Whir-r—" went one of them on my side, and so startled me that I forgot to shoot. "Why didn't yeh git him?" asked the boy, laughingly.

"Whir-r—bang!" on the boy's side. "Got him," he said, laconically, as he broke his gun and threw in a fresh shell.

"Now look out 'n' when yeh see one shoot, whether you get him or not, 'n' watch 'im down," he added, musingly. In a few moments I rather enjoyed the unexpected rattle of wings and swift flight of the birds, and was blazing away as though I had shot that way all my life.

The boy's gun was busy too, and when we counted heads at the end of the fence we had nine fine quail between us. I had missed as many as I had shot, and the boy gave me advice in this manner: "Yeh got to shoot snapshot; this way, see? Now the way I do is to go 'long with my gun down in both hands, my thumb on the hammer 'n' my finger on the trigger, 'n' when a bird gets up I juss watch the bird 'n' jerk up the old gun 'n' blaze away juss as soon as she touches my shoulder. As I pull up, I cock it 'n' touch the trigger as she touches my shoulder. That way you can't hardly miss 'n' it's easy when you get the hang of it. Your gun jumps to your shoulder juss right on a level with your eye. So all you got to do is to shoot 'n' down goes Mr. Quail. Juss as easy as eatin' pie."

"All right, I'll try and remember what you've told me," I answered, "though I expect to score a whole lot of misses before I get the hang of it."

We wandered along through several cornfields, and at last came to the edge of a piece of wild hay land.

A jack rabbit track struck out of the corn into the grass just where we came to the edge of it.

"Now we'll trail this feller up 'n' git him," said the boy. "Reckon he's strikin' for home when he made these tracks." The boy took the trail, telling me to be ready "'cause he might git up a-runnin' any time."

Winding about through the knee-deep tangle of wild grass, we followed the trail, sometimes so broken by the snow that had fallen in it as to be nearly lost to any one but the boy, who followed it swiftly and walked with a long, easy stride.

Presently he stopped short and said: "Now this feller was a-huntin' a place to sleep when he come out here. 'n' he's fooled around this way 'cause th' snow hangs on th' grass too much 'n' he knows it'd come dribblin' down all over him if he holed up under a bunch in here. Now I reckon he'll git disgusted purty soon 'n' light out right 'cross toward that pasture over there 'n' set down 'n' under a wad o' bunch grass in there. Yeh see, the bunch grass don't hold th' snow like this blue stem does, 'n' Mr. Rabbit knows it, 'n' he'll be mighty apt to be in that pasture, 'n' not far in either. C'm on, less go git him."

Again we followed the winding of the trail, and soon it struck a straight line, with long distances between the tracks, showing that the jack had fulfilled the boy's predictions, based on his intimate knowledge of jack rabbits and what he read in the trail of this one's doings.

We had just crawled through the barbed-wire fence that surrounded the pasture when a flurry of snow made a halo around a bunch of grass, and out of it came the rabbit under full sail.

"Shoot!" said the boy, and my gun sounded a "hurry-up" call that had the effect of lengthening the distance the fleeing game made between his footprints. Like an echo the boy's gun cracked, and the jack did a combination handspring running fall, mixed indiscriminately with a dozen or so first-class somersaults, bringing up on his back with a thump, quite dead. That snap shot of his did it quickly and effectively.

We were now on top of the divide, and our tramp had so roused the inner man that lunch was decidedly the thing, and it was forthwith produced. We could see miles of country spread out in gentle rolling hills, white with the mantle of new snow, against which the dark lines of timber along the creeks and river wound in contrast. The winter sun shone with the prairie brilliancy and the air was just cold enough to be bracing. It was a day to tramp abroad and enjoy shooting—one of those rare winter days that are as bracing as good wine.

Lunch disposed of, we struck out again through the withered fields of corn, across the tangle of wild grasses and through the weed patches that filled the bottoms of the brakes or draws. Cottontails scurried out and turned handsprings as the guns cracked, quail whirled up into the air and came down dead as the smoke curled from the muzzles, until the sun hung low and our hunting coats were stuffed with game.

"Less go home," said the boy at last, and then we pulled the shells out and slung our guns with straps over our shoulders so we could "hit the trail" without hindrance.

"Gee, I'm tired!" said the boy. "Never seem to git tired till I strike for home, nen ever' step seems like

FLORIDA INDIAN MODE OF DEER HUNTING.
From Le Moyne's Narrative—1564.

it's harder'n the last one, 'n' when I get home I'm plumb done up."

"Same here," I answered.

The sun hung like a ball of gold and reflected pink tints on the snow as we crossed the river, sleeping under its icy coat, and climbed the hill into town, where blue smoke spirals wound up from chimneys and savory odors came down the gentle evening air, as the busy housewives prepared the supper for tired men.

"Hello, been huntin'?" "Git anything?" inquired our acquaintances as we passed.

"Yep," answered the boy, and they all knew him well enough to know that he meant a good bag.

"Well, so long," said the boy, "let me know when yeh run out o' meat. I know where we can get more."

"So long," I answered, turning in at the gate and walking up the broad path of light that made a ruddy glow on the creaking sidewalk. EL COMANCHO.

Natural History.

Value of the Mole to Agriculture.

BULLETIN No. 31 of the Pennsylvania Department of Agriculture has lately been issued. It has to do with the economic value of the mole in its relation to agriculture.

Mr. Thomas Edge, State Secretary of Agriculture, has commissioned Harry Wilson, of Gum Tree, Pa., to prepare a report on this interesting subject, and in a brochure of forty-two profusely illustrated pages our author presents the results of his investigations on "The Economic Status of the Mole." Appreciating the high standard of scientific work now being done by American students in economic ornithology and mammalogy, we are naturally curious to know who Mr. Wilson is and how much he has done to enlighten the Pennsylvania farmer and zoölogist on the vexed mole question.

It may make little apparent difference to the agriculturist, but the zoölogist is not a little shocked to see in his Letter of Transmittal that Mr. Wilson has a very limited acquaintance with nomenclature or the construction of ordinary zoölogical names. In consequence, throughout Part I., pages 11 to 25, we have abundant errors of spelling, classification and use of words, indicating a lamentable lack of ordinary literary fitness for the task imposed. As an instance, we may cite page 11, in which, at the outset of the work, there are three typographical errors, two misspelt names and two serious mistakes of nomenclature, in the short synoptical key at the top of the page. The author quotes (or rather misquotes) freely from Prof. Baird's work of 1857 as to the characters of the species and genera, evidently ignorant of the fact that Mr. F. W. True had published* a complete revision of all our American moles, in which the entire subject covered by Mr. Wilson has been brought to date from a scientific, and in some respects an economic, standpoint.

On page 17 Mr. Wilson gives us some "Miscellaneous Notes" on the common mole (*Scalops aquaticus*), which are of value as adding somewhat to our knowledge of the habits of that species, the actions of this mole in swimming evidently being based on his personal observations, though the author fails to say so. The fact that *Scalops aquaticus* can swim, however, is not an argument in favor of the propriety of Linnaeus's specific name, as Mr. Wilson inclines to think. The most strictly terrestrial mammals can, when forced to take the water, swim better than the common mole, and it remains a fact that our knowledge of the habits of this species shows it to be one of the least aquatic of the American Talpidae.

In his treatment of the star-nosed and Brewer's moles the author not only follows the misleading systematic arrangement of fifty years ago, but in such a way as to show that he had no personal acquaintance whatever with either species, and he makes no attempt to treat of their habits.

In Part II. the economic relation of these moles to agriculture and their distribution in Pennsylvania is discussed. The economic question is treated on the basis of the examination of thirty-six stomachs of *Scalops aquaticus* taken in eastern Pennsylvania between June 19, 1896, and Oct. 13, 1897. No examinations of the stomachs of the star-nose mole are recorded. Fortunately these mole stomachs were submitted in several cases to the proper specialists, and the identifications can be relied upon as representing the fullest and most accurate record of the food of the common species throughout the year which we yet possess. In this respect, and this only, has Mr. Wilson's work justified the time and expense devoted to it by the State Department of Agriculture, an expense, however, out of all proportion to the results attained.

Of the 36 specimens examined, all contained animal food-matter; 27 had eaten earthworms in common with other material; 7 had eaten earthworms alone; 27 had eaten insects of which a large proportion were injurious species, as *Lachnosterna*; 9 had eaten insects only, and 10 had taken vegetable matter in connection with insect food. None had taken vegetable matter only. Only 2 of those containing vegetable matter could have devoured it intentionally; one of these had short sections of grass blades in its stomach, apparently bitten off piece by piece, but as this stomach also contained a June bug or May beetle, Prof. Howard thinks the mole was only indirectly responsible. In the other case the fragments of nearly a whole grain of corn were found.

Mr. Wilson's conclusions as to the economic status of the mole, referring in this case solely to the common *Scalops aquaticus*, may thus be summarized: 1. Stomach examinations with very few exceptions (and these perhaps fortuitous), acquit the mole of intentionally devouring vegetable food. 2. The mole is strictly insectivorous (independently of its earthworm diet), devouring a larger proportion of injurious than of beneficial insects. 3. Having so proved it, is equivalent to proving that its work is beneficial to agriculturists, the mechanical injury to vegetation due to its burrowing being more than compensated by its destruction of noxious insects. 4. The ravages of field mice and other small burrowing rodents which follow the runways of the mole are almost always the cause of the popular prejudice against the latter animal.

We agree largely with these conclusions so far as they go, and only wish that our author had been able to give judgment as to the star-nose mole. From what we know of its habits and distribution, however, as well as its scarcity in arable lands, it is safe to say that a more harmless mammal than the star-nose does not exist. As to the excessively rare Brewer's mole, Pennsylvania agriculture has still less to fear. Mr. Wilson questions its existence in Pennsylvania, but Mr. True records a specimen in his "Revision" taken at Hollidaysburg, in Blair county. The habitat of this species is largely confined to deep, cool, coniferous forests.

An important and generally ignored subject in the economy of the mole is the significant fact that its food consists largely of earthworms. Most investigators seem to think that if it can be proved that the mole eats nothing but earthworms and insects, then he is clear of suspicion and an unmixed benefit to agriculture. One of Mr. Wilson's correspondents significantly says that he considers the common mole injurious to growing crops "by its destruction of earthworms"! It seems most pertinent that the next question for our agricultural de-

partments along this line of research should be first to decide whether Darwin's views as to the value of earthworms to soils and agriculture are correct. This once decided in the affirmative, it remains for the champions of the mole to prove that its destruction of worms is a necessary check to their excessive increase, and that the mechanical effects of the mole worker on soils are of greater volume than that of the worms it destroys. Another matter, in which the mole figures largely in hilly districts, where the soils are easily washed by rains, is its agency in the denudation of top soils. In some parts of the Ohio Valley the effect of their tunneling on arable hillsides is most disastrous.

The forty answers from correspondents to 125 circulars sent out by Mr. Wilson for information as to the habits and distribution of the common mole and the star-nosed mole in Pennsylvania, are of some value where coming from trained or conscientious observers. On going over the list, however, it is evident that a large percentage are not only unable to distinguish between the two species (many observing people never saw a star-nose mole), but also do not distinguish between the underground labors of a mole and those of the Wilson's meadow mouse (*Microtus pennsylvanicus*) and the pine mouse or burrowing field mouse (*Microtus pinetorum*).

Mr. Wilson's studies have evidently made him a friend of the mole, but on page 33 he gives us some hints as to how to banish or exterminate it where its workings in the lawn and garden become particularly vexatious. His suggestions as to banishment are to be recommended, not only from a humanitarian standpoint, but as of practical utility, for it is notorious that the destruction of moles by traps or other device is most ineffectual.

Viewed as a whole, Bulletin No. 31, of the Pennsylvania State Department of Agriculture, on "The Economic Status of the Mole," is, to say the best of it, a disappointing brochure. From the standpoint of the zoölogist and scientist it is lamentably behind the times, and on that account misleading.

Did we not know that the methods pursued by the Pennsylvania Department of Agriculture in its Division of Economic Zoölogy have as yet failed to utilize the naturalist in preference to the favorite and the politician, Pennsylvania scientists would have greater cause to look to their laurels. In 1896 the State Zoölogist under the new regime, no doubt desirous to make some showing of his fitness for the position, issued Bulletin No. 6, on "Taxidermy"! appending thereto the game and fish laws of the Commonwealth. Under the transparent guise of a manual for students in "Economic Ornithology," this Bulletin teaches Pennsylvanians how to collect birds and their eggs, with no other object, apparently, than that of the ordinary writer of such works who follows taxidermy merely as a matter of business.

It would be interesting to know what Thomas J. Edge, our Secretary of Agriculture, thinks of this Bulletin, with its "game panels" and "screens" and directions for blowing birds' eggs, as a factor in economic ornithology. If the as yet half uttered verdict of scientists, naturalists and Audubon societies were made his criterion, no doubt Mr. Edge would prefer to say nothing about that Bulletin.

We are glad that the Mole Bulletin, despite its lamentable defects, represents conscientious effort, and that it furnishes those who are able to detect its errors some valuable data upon the subject, and that in direct bearing upon economic zoölogy. For this we are thankful and willing to give Mr. Wilson fullest credit, realizing how hard it is to refuse the honors and responsibilities which men will thrust upon us. Meanwhile, let us pray for that form of civil service in our Commonwealth which will soon enable Pennsylvania to keep pace with American progress in the far-reaching domain of economic zoölogy.

S. N. RHODES.

ACADEMY NATURAL SCIENCES, Philadelphia, Feb. 2.

* Proceedings Nat. Museum, Vol. XIX., 1896.

New York Zoological Society.

THE amount stipulated for in the bill appropriating \$125,000 of city money for work on the grounds of the New York Zoological Society has been subscribed, and work on the park will begin with the opening of spring.

At the last meeting of the executive committee of the Society, held at the residence of the president, ex-Gov. Morton, it was announced that the subscriptions to the special fund for buildings, collections, etc., now amount to \$103,550.

Of the sum of \$250,000, which the Society is obliged to raise for buildings and collections in order that the grant of the land may be permanent and the collections maintained by the city, \$100,000 was required to be in the Society's treasury by March 24, 1898, and everyone interested in the work will be gratified to learn that this condition has now been complied with. It is hoped that the park may be open to the public, and that collections of animals may be on exhibition there a year from the coming spring.

All plans are in readiness for active work on the buildings, and the Park Department is expected to make the ground improvements necessary to prepare the park for the erection of such buildings and for the reception of the public. Additional funds, however, are greatly needed by the Society, and it can hardly be doubted that the many wealthy men of this city who have not yet subscribed will be glad when their attention is called to this matter to add their names to the list given below. Besides such larger subscriptions the list of annual members of the Society ought to be markedly increased, and this will unquestionably grow as the Society and its work come to be better known. A gift of \$5,000 entitles the donor to be called a founder of the Society; the giver of \$1,000 or more becomes a patron; the gift of \$100 entitles one to life membership. The subscribers to the building fund are as follows:

O. Ottendorfer.....	\$5,000	Mrs. W. H. Osborne.....	\$1,000
P. R. Pyne.....	5,000	Samuel Thorne.....	1,000
W. K. Vanderbilt.....	5,000	Henry W. Poor.....	1,000
Levi P. Morton.....	5,000	George Crocker.....	1,000
W. E. Dodge.....	5,000	C. W. Harkness.....	1,000
Robert Goellet.....	5,000	George T. Bliss.....	1,000
J. P. Morgan.....	5,000	W. C. Schermerhorn.....	1,000
J. H. Schiff.....	5,000	J. Howard Ford.....	1,000
W. D. Sloane.....	5,000	W. C. Osborn.....	1,000
W. C. Whitney.....	5,000	Abram S. Hewitt.....	1,000
C. P. Huntington.....	5,000	Mrs. J. B. Trevor.....	1,000
H. A. C. Taylor.....	5,000	H. McK. Twombly.....	1,000
George J. Gould.....	5,000	James C. Carter.....	1,000
J. L. Cadwalader.....	2,700	H. O. Havemeyer.....	1,000
John S. Barnes.....	2,500	Henry H. Cook.....	1,000
Philip Schuyler.....	2,500	George F. Baker.....	1,000

E. J. Berwind.....	1,000	T. M. Marc.....	100
William H. Webb.....	1,000		
C. T. Barney.....	1,000	Total.....	\$103,550

Linnaean Society of New York.

ON March 17 a public lecture will be given in the lecture hall of the American Museum of Natural History, on "The Mammals of North America," by Mr. Ernest Seton Thompson; illustrated by views from nature and from original drawings by the lecturer.

WALTER W. GRANGER, Sec'y.

Game Bag and Gun.

The Jackson's Hole Game.

JACKSON, Wyo., Feb. 15.—*Editor Forest and Stream:* I am much gratified that I may report that our winter here seems to be broken, with not more than 4 in. of snow in the valley at present, and with a great portion of the foothills bare. The elk, which a few weeks ago were within sight all around the ranch, are already working back into the hills out of sight. They are still in good condition, with no loss whatever from the winter. If it should turn on and storm, the condition of the elk is such that they could stand a great deal of rough weather without suffering any loss; and the chances are favorable for them to increase to their old numbers two years ago. I inclose report from a recent News-Register, relating to the Glidden outfit.

S. N. LEEK.

The News-Register reports:

The people of the valley, with few reputed exceptions, are jubilant over the recent actions of the State Game Warden, upon request of Gov. Richards, in the revoking of the permits to capture and ship elk, etc. This question is one which has solidified the people upon its being carried out as was indicated it would be when the question first came up. As matters progressed it looked favorable to the game. The stand taken by the game warden in the first instance, followed by the opinion of the Attorney-General, indicated that we as a people were more directly interested than any one, and would be compelled to take a stand. Then came the news that the game warden had issued a permit to ship forty head of elk. The fact of the elk being shipped, and the assertions of one Glidden (which threw an unjust suspicion upon the Governor of the State as well as the State Game Warden), and the fact of his having obtained three separate permits to capture and ship game, so de termined every person in the valley to make a request for at least a modification of the orders granting permits, which now remains to have been issued upon misrepresentation; 95 per cent. of the people of the valley made a demand that Glidden's commission of game warden be revoked, and substantiated the petition with affidavits as to Glidden and his practices, which connected him, and justly, as being a person with whom misrepresentation was a part of his stock in trade. The Jackson Hole Gun Club, in behalf of the game interests, made a strong request for the revoking of the permits to capture and ship elk. The action of the game warden, accompanied in a letter to the people from Gov. Richards, revokes absolutely the permit to

H. K. Glidden to ship fifty head of elk, the permit of Margaret Adams to ship five head of elk, out of a prior permit to ship forty head of elk, thirty-five of which had been shipped; and the permit to M. W. Pettigrew to ship two head of elk. Also the revoking of the commission of a deputy State game warden, issued to said Glidden in December last, and the further statement that under no circumstances would any more permits be issued to capture or ship wild game from the State. This makes us feel glad. We feel that the game interests have not been subverted to any personal ends. It is evident that the Governor was misinformed in some respects as to the condition of the game interests in this locality; it is evident that Glidden and others in his employ disregarded the truth, and under numerous promises to be good, etc., got something which is now granted as lost. The people of this valley thank the State officials for favors in this regard, and appreciate the full and complete actions taken in behalf of the game interests of Uinta county.

Foxes and Grouse.

Editor Forest and Stream:

Among the many enemies of small game the fox has—and perhaps unjustly—been condemned as one of the most destructive. In this part of New Hampshire the ruffed grouse is what we to a great extent depend upon for our shooting. We also have a good many red foxes. During the past twenty-five years I have hunted pretty steadily in this vicinity. Following up the birds from the opening of the season until snowfall, and then turning to the foxes in our New England style of hunting them, I should not care to form an estimate of the number of miles I have tramped when after them, or the hundreds of tracks I have seen. It is enough to say that I have shot a good many, and am now on my third hundred.

I have never as yet shot a fox which could be called thin in flesh, and many were quite fat. I have often wondered what they lived on, particularly during the winter months when the ground is covered with snow, as in all my tramps after them (and I have taken pains to observe) I have seen not more than five or six places where they had caught grouse or any other birds. I have followed their tracks on deep snow when they went quite close to where grouse were lying under the snow, and I can recall but one instance where I saw where a fox had tried to catch one under such conditions. The fox made quite a long leap, landing apparently fairly over the bird, but the grouse was too quick, and got away, leaving a few tail feathers. I have followed many a fox track through swamps where the snow was completely trodden down with rabbit tracks, and the foxes took no notice of them. I occasionally see where one has caught a rabbit, but not on an average once in each winter. I saw once a fox following a rabbit. I had shot a fox that day, and was on my way home when I saw one of our large white rabbits running fast toward me. When a few feet away the rabbit saw me and turned to one side. I waited to see what was coming next, and in a few moments a fox came trotting along on the rabbit's track. At the rate he was going he would never have caught up, and he seemed to think so. When some 30 yds. from me the fox stopped and smelled of the track he was on. I watched him for a moment and gathered him in.

I have often cut open the stomach of a fox when it appeared fuller than usual, and almost always have found remains of mice; and if early in the winter, when there was but little snow, there would be quite an amount of chewed-up apples. A fox which my dog holed a few minutes after starting, I found, had just eaten a grouse. I know well that foxes are great mousers, and that the squeak of a mouse is very attractive to them, as I have shot quite a number by calling them to me, even when a dog was after them; they would always come if the dog was not too close.

I know that foxes are very destructive to poultry, and the people about here have long since given up raising turkeys on account of the foxes. Last fall a fox came with unfailing regularity every night into my yard, taking a duck each night until the ducks were shut up; then he would come within 50 yds. of the house and bark; and I would let my hound out, and he would chase him all night. I have that particular fox's skin hanging with some others I have.

During the breeding time foxes may do considerable damage both to eggs and very young birds, although I have never seen any evidence of it. I have often found grouse nests full of eggs within a few feet of cattle paths near the edges of the woods, and there were sure signs that foxes had traveled those parts, apparently never suspecting the presence of the nests. I have heard that a grouse when on a nest gives out no scent. I never knew of a dog's pointing one under such conditions.

I think your correspondent, Mr. Sullivan, is correct when he says that a certain class of sportsmen, in blaming the foxes for the decrease of some kinds of game, wish to find a scapegoat for their own deeds.

When I first began shooting about here, twenty-five years ago, I could start fifty grouse where I would do well now to find a dozen. Foxes were also many times as numerous. My neighbors then, men and boys, nearly all went gunning more or less; and when any of them shot a grouse it was out of a tree or on the ground. Should a bird get up right at their feet, they never thought of shooting. To-day almost every one owning a gun shoots on the wing; and many do it well. My nearest neighbor, a young man who previously to last fall had killed but one grouse on the wing, shot last season, using a \$6 gun and no dog, sixty-five grouse; and the way in which he would drop his birds, even in very hard places, shows why the game is growing scarcer.

In the times past when game was plenty not much attention was paid to the game laws. Never have they in this section been so well enforced as at present. With the exception of five grouse killed this winter by a man living some six miles from here, and for which I hear he was promptly fined, I do not know of a single in-

stance where a game bird has been killed in close time since last spring; and this is more than I can say of any previous year.

Of course foxes, skunks, mink and such animals do destroy some game; but the very worst enemy our game has is the market shooter. Almost invariably he is a rattling good shot and an untiring worker, hunting from daylight to dark, day after day. He wants every bird he starts, and sticks to it until he gets most of them. His dog is a genuine meat dog, and knows well how to do his work. Next to the market shooter comes the sportsman who shoots for sport, and never thinks of selling any of his game. He is seldom anywhere near as good a shot as the market hunter, nor is he such a worker; yet he will kill all he can. His dog, although of bluer blood, is not "in it" with the meat dog. Considering the numbers both of market shooters and of sportsmen who are daily in the field during the season, it is a wonder the game lasts as well as it does.

C. M. STARK.

DUNBARTON, N. H., Feb. 24.

Maine's Game Revenue.

IN his address before the recent Tampa Fisheries Congress Commissioner L. T. Carleton said of Maine's fish and game resources, their magnitude, value and administration:

You will pardon me, sir, when I declare to you that Maine in this respect, as in many others, leads the world. In her limitless forests roam countless numbers of the monarch of the forest, the gigantic moose, the bounding caribou and the graceful, beautiful Virginia deer.

In her more than 2,000 inland seas and lakes are found in greater abundance than elsewhere the square-tailed trout and the landlocked salmon.

The great dailies and sporting papers of the American continent are in the habit of referring to Maine as the "Paradise of the Sportsman," and this is a very appropriate title, and nowhere is there such sport to be had for either rod or rifle. We have an area of about 30,000 square miles in extent, and from the nature of the soil and climate affording food and cover for numberless herds of deer, caribou and moose, not to speak of the countless flocks of birds, both indigenous and migratory, including the ruffed grouse, woodcock, snipe, wild geese, black duck and wood duck, and an endless variety of sea birds, and the whole world is fast learning of our advantages in this respect.

In her majestic rivers, those great highways from the mountains to the sea, is found, in ever increasing numbers, the best fish that swims the ocean blue, the Atlantic salmon. Wise, well-considered laws we have, and an enlightened public sentiment.

Ten thousand citizens of other States during the open season last year, now just closed, came to Maine to fish and hunt, employed our 1,300 registered guides, skilled guides, and spent \$4,000,000 in shining gold among our people, and killed 10,000 deer, 250 moose, 230 caribou and 160 bears, while \$6,000,000 more were spent there by non-residents last year, by visitors to our seashore and inland summer resorts, making \$10,000,000 expended in Maine last year by non-residents for pleasure.

Do you wonder that the people of Maine are marvelously interested in fish and fisheries? We follow the example of the great Apostle Peter—we go a-fishing and invite everybody to come and do likewise.

We have a health-giving, invigorating climate, wondrously charming and enchanting scenery. There's not to be found a poisonous reptile, nor ravenous beast, nor poisonous insect, in all her borders, and in her mountain streams, numerous as the sands of the seashore, are the protected nurseries of our lakes, wherein are millions of speckled beauties, the brook trout, and these feeders are so numerous, so well protected and re-stocked by artificial propagation as to give assurance that fishing in Maine will be better and still better as the years go and come in an unbroken, endless procession.

Something has been said here about the constitutional right of a State to enact restrictive and protective laws, regulating the times in which and the circumstances under which inland fish and game may be taken. That question has fortunately been settled for all time in the United States. The United States Supreme Court in a late decision has declared that the people of a State in their sovereign capacity own the fish and the game within its borders, and may say through its Legislature how, when and where it may be taken, and what may be done with it after it has been taken; in other words, the Legislature may give a qualified property right or ownership to fish and game lawfully taken.

We have found by experience that protective laws are necessary, and that these laws must be enforced.

Why, do you know that down in Maine if a person is shot by another while hunting it is called an accident, but if a person shoots a moose or a caribou unlawfully we imprison him four months in prison "without the benefit of clergy."

As true disciples of Izaak Walton we propagate artificially the trout and the salmon, and aided most greatly by the United States Fish Commission, we are constantly making the fishing better, and the multitude is constantly growing larger of those who come among us. And let me say, though I am no prophet, or the son of a prophet, but only a down East Yankee, that in these time of wages growing less and still less, and the army of unemployed constantly being augmented, that the Congress of the United States can display wise statesmanship by giving earnest attention to the improvement of fishing, better fishing to those who go down into the sea in ships, better opportunity to secure this good, wholesome food, greater opportunity to willing hands to engage in this great industry.

Dollar wheat may be a blessing to the farmers of the West, but it means dearer bread to the toiling millions; but better than dollar wheat would be a great abundance of fish and game and enlarged opportunities to our laboring people to engage in this great and important and growing industry.

CHICAGO AND THE WEST.

A Relic of the Past.

CHICAGO, Ill., Feb. 19.—From the Blackfoot reservation in Montana Mr. J. W. Schultz writes me in regard to a recent find made by his son of a relic which carries one back to the days of the Indian and of the buffalo.

"Riding up the steep rocky side of a butte near my ranch the other day," he says, "my son found a flint-lock gun lying upon the gravelly slope. It was cocked, there was a priming of caked powder in the pan, and later investigation shows that it contains a load nearly 3in. in length. The ramrod had been chewed into small bits by the prairie mice or other rodents, probably for the grease it contained, and the stock is quite rotten where it touched the ground, but the side exposed to the weather is still sound, and, although quite rusty, the gun is still in fair condition. It is stamped on the lock "Parker & Field, 1861," and the barrel is stamped with the British crown and other proof marks.

"This is one of the guns the Hudson's Bay Co. used to trade to the Crees and other northern Indians, and was probably lost by its owner during a raid down here against the Blackfeet. It is possible the owner may have dropped it in flight, but more likely he was wounded and died where the gun was found. Quite near the place the gun laid is a deep crevice, into which the wolves would have dragged the body, and the freshets long since have covered the bones.

"News of this find soon spread, and Indians from all directions have flocked to my house to view this relic of the olden times. Each one's eyes have glistened as he beheld the ancient piece and reverently handled it. We have, figuratively, been wading waist deep in gore and blood, for all the battles with their ancient enemies, the Crees, have been recounted by my visitors, and I've had visions too of fleeing herds of buffalo, pursued by the naked warriors mounted on their fleet-footed ponies, and along the trail the yellow prairie has been dotted by the huge dark forms of the slaughtered creatures. And with these simple red men, I too wish we could have those times over again. Who wouldn't trade the cattle and the railroads and all this tame civilization for the wild, free life of those other days?"

What historic ground is this upon which this old Hudson's Bay piece was found, and what a train it does indeed bring up of regretful recollections of the once glorious, but now fading and forgotten West of the good old days!

Sun River Slaughter.

The North Fork of the Sun River, in Montana, is a good game country, especially in the winter, when the elk, sheep and deer are driven down out of the mountains. For some weeks skin hunters have been operating in that region, and have killed some hundreds of elk, deer and sheep. This action has been taken up by the press of Montana, and the sportsmen of Helena and other cities have undertaken a crusade to stop the slaughter. Deer hides net the killer from 50 to 75 cents each. Elk hides bring \$2 and upward. One man killed sixty-five elk. Last winter a party of these same men had a bunch of elk corralled for shipment East, but the animals were too weak, so they were shot and skinned.

A Western Interstate Meeting.

The convention of State wardens and legislators at Chicago last week has attracted a great deal of attention all over the West, and the idea seems in a fair way to receive expansion. The Salt Lake, Utah, Herald takes up the idea editorially in the following form:

"Why cannot such a conference be held by the game wardens of Utah, Colorado, Wyoming, Idaho, Montana and Nevada? The natural game seasons in all these States are about the same. If the open and closed seasons were made the same in all of them it would make impossible, to a very large extent, the illegal traffic in fish and game that now goes on in all the States above named. When a game warden caught a hunter or dealer with game that was out of season it would be impossible to say that it was killed in or shipped from Idaho or Colorado or Wyoming or Utah, as the case might be.

"It is only within a few years that the importance of protecting the fish and game has been fully realized in the West, but now it is, and public sentiment is in favor of all measures that will tend to preserve and increase the game. Uniform fish and game laws in the States above named would have a very strong tendency that way."

Michigan Deer Licenses.

Deputy Warden Brewster, of Michigan, has prepared his statement of the deer licenses, resident and non-resident, issued by the State of Michigan during the season for 1897. In detail it is as below, for the counties respectively:

Alcona 30, Alger 423, Allegan 114, Alpena 161, Antrim 185, Arenac 50, Baraga 219, Barry 87, Bay 123, Benzie 87, Berrien 83, Branch 32, Calhoun 79, Cass 38, Charlevoix 213, Cheboygan 271, Chippewa 415, Clare 28, Clinton 141, Crawford 102, Delta 372, Dickinson 459, Eaton 107, Emmet 479, Genesee 120, Gladwin 47, Gogebic 95, Grand Traverse 233, Gratiot 126, Hillsdale 52, Houghton 286, Huron 11, Ingham 108, Ionia 75, Iosco 129, Iron 203, Isabella 46, Isle Royal none, Jackson 86, Kalamazoo 60, Kalkaska 143, Kent 206, Keweenaw 1, Lake 79, Lapeer 119, Leelanaw 26, Lenawee 52, Livingston 166, Luce 75, Mackinac 199, Macomb 54, Manistee 149, Manitow none, Marquette 844, Mason 152, Mecosta 63, Menominee 366, Midland 104, Missaukee 95, Monroe 47, Montcalm 107, Montmorency 93, Muskegon 54, Newargo 87, Oakland 156, Oceana 84, Ogemaw 217, Ontonagon 127, Osceola 202, Oscoda 66, Otsego 125, Ottawa 32, Presque Isle 102, Roscommon 88, Saginaw 170, Sanilac 20, Schoolcraft 397, Shiawassee 133, St. Clair 46, St. Joseph 53, Tuscola 112, Van Buren 80, Washtenaw 35, Wayne 137, Wexford 186.

Licenses issued to non-residents: Alger 2, Alpena 7, Dickinson 26, Gogebic 1, Iron 1, Marquette 3, Menominee 2, Schoolcraft 2.

The State realized \$4,051.25 on the licenses, and the counties \$2,962.

Common Carriers.

Suit was brought by Deputy Warden Slocumb, of lower Illinois, against the Adams Express Company last week for \$2,000 under the charge of being in the possession of illegal game, and a similar suit to this has been commenced by Attorney Mead, of Shell Lake, Wis., against the Adams Express Company for accepting illegal game for transportation. This case was brought up by that of John B. Olson, who shipped a lot of birds and venison to St. Paul labeled as poultry. Olson was fined \$125 and lost his birds, which were seized at St. Paul by the State warden.

Spring Ducks.

Ducks have appeared in large numbers along the Kankakee River, and have come in on the Tolleston Marsh, nearer to Chicago, in good flight. At the Calumet Heights Club, along Lake Michigan shore, the deep-water ducks were numerous this week, and a fisherman who also shoots a bit made a big bag from the edge of the ice fields. Still nearer to town, off South Chicago and along the Seventy-first street piers, the birds have been seen and shot in numbers. A sad result of this was the drowning this week of two South Chicago hunters, Michael Lutkoski and John Ofchrosky, whose boat was capsized while they were out attempting to put out their decoys just outside the ice pack. The men were entangled in their decoy lines and lived but a short time in the icy water of the lake. They had been tempted by the heavy flight of bluebills along the edge of the ice.

Bob Whites for Washington.

Sportsmen of Pullman, Wash., have ordered ten dozen Bob White quail from Kansas, and will try to establish that bird in the region around Pullman, where they will be protected until 1900. While I have no definite word to that effect, I should not be surprised if behind this movement would be found Prof. John A. Balmer, once of Vincennes, Ind., who moved to Washington later. From what I learned of Prof. Balmer in course of several days' shooting with him in the fall of 1893, I am disposed to think that he would never be entirely happy in any country which did not have Bob Whites in it. I suppose it was a case of either moving back to Indiana or moving quail out to Washington.

"One Dollar, No More, No Less."

The finance committee appointed at the late convention of the Illinois Sportsmen's Association at Peoria have begun the work of soliciting funds from the members of the Association all over the State. The committee will not ask any contribution larger than \$1 from any man, and will not attempt to hold up the sporting goods trade for donations, but it will ask each and every man who belongs to the Association or cares to have better laws and better means of enforcing them to come forward at once with his \$1. Subcommittees of finance, composed of three or five members in each club, will be appointed, and these will be asked to apportion out the club lists. To each member of each club a statement will be sent of the sense of the late convention on game matters, as shown in the answers to the list of questions sent out, and as voted upon by the convention. Each member will also have sent to him a brief statement to the effect that a bill will be drawn in accordance with the above sense of the Association, and that the passage of the bill will require more than idle methods and will imply the raising of funds to send a delegation to Springfield. The request will be for "\$1, no more, no less." After receiving this request the sportsman will know very soon what he wants to do about it. The subcommittees will take up their canvas after this advance information has been sent out, and each man of such committee will have a subscription list, which will serve as a record, each man who contributes \$1 putting down his name. After the club canvas is made the total of the contribution is to be forwarded to the finance committee. The work is now in progress, and it should not take very long to complete the canvas if the local committee go to work at once and do not allow delay in the collections. It is not much to ask, \$1 for good laws. The man who will not loosen to that extent does not really care what the law is. All will be treated alike in this plan, so that no one ought to complain and all ought to pay. Sportsmen have sometimes been accused of a disposition to pass resolutions and not pass any cash. Let us see if this old accusation shall not be proved to be in this case unfair.

Mass Meeting.

In another column I have submitted the complaint of a young sportsman who states facts regarding violations along the Rock River of this State. It seems that he has not been alone in his discoveries or in his reflections upon the same. A mass meeting of the citizens of Rockford, Ill., was called on the evening of Feb. 15 and a gratifying action is shown. Organization was made, with R. G. McEvoy as president, and Chas. Baldwin secretary, and the intention is to keep up the body permanently, with a membership of over 100. The plan is to charge a membership fee, and also dues of perhaps 50 cents monthly. This is not much, but \$50 a month spent in protection will rid the beautiful Rock River of nets and stop illegal gunning around Rockford. It is not really so very difficult to do, but the way to do anything is to do it. The local press has taken up the fight for decency in game laws, something which the average local paper is afraid to do for fear of offending some country subscriber who owns a seine or shoots out of season. Let me suggest to my friends Messrs. Cohen and Bartlett, of the State Fish Commission, and to State Warden Loveday also, that since the men of Rockford have taken hold of this work in earnest, it would be a graceful thing to send them deputies who shall help them as much as possible.

Spring Ducks in Illinois.

The rising waters have cleared the ice from many of the streams in Illinois and Indiana, and the north-bound water fowl have appeared in good numbers all over the usual ducking grounds of this region. A number of heavy bags have been made along the Kankakee.

Another Record Moose Head.

Since the opening up of the Alaskan regions by the gold-seeking rush, much has been printed in regard to the big moose of that far-away hunting ground. A spread of 69½in. was thought the top notch for a time, but two weeks ago a local fur dealer here, C. F. Periolat, showed a head from the Copper River country which measured 73½in., this grand specimen having come from the agent he had sent up to the Copper River country for the purpose of buying furs and specimens. This moose head was considered in turn as the last best offering of the Alaskan woods, but this week a yet larger one came down from the same source, and this head scales 74 3/8in. from tip to tip of the antlers—truly a phenomenon which could come from only such a terra incognita as that of Alaska, so soon to become one of the famous hunting regions of the earth.

These big moose which Periolat has shown were killed by his man, R. C. Raddatz, and the latter writes that he killed this last one with the .30-30 rifle, the soft-nosed bullet passing entirely through the body back of the shoulders. He says that the ball tore a hole as big as a dollar on the far side of the animal—this at a distance of over 300yds. Now that the Winchester people guarantee the nitro powder to do its work in any temperature, the small-bore rifle with the above work to its credit would seem to be all that could be asked as a weapon suited to the extreme North.

Mr. Raddatz also got a fine specimen of the white Alaskan sheep (*Stonei*?), the horns being stated to measure 64½in. over the curve. This animal was pure white and very beautiful. Truly the latest hunting stories from this land of wonders are of a sort to make men uneasy and anxious to pack their outfits for the upper trails.

How it Works.

The working of reciprocity in matters of game laws was illustrated this week by the seizure by Warden Loveday in Chicago of two barrels of partridges which were shipped from St. Paul, and which are being held for the action of the Minnesota authorities. When the violators of the law find that these contraband goods are not safe either going or coming, they may perhaps not be so willing to engage in the business of handling the contraband stuff.

Speaking of contraband game, there is at hand the record of a very important seizure made by Deputy Phillip, of Minnesota, of 800 partridges from the celebrated, or infamous, district around Tower, Minn. This game was seized in a peculiar way. An agent of an outside commission house posed as a stranger, but excited suspicion, and was shadowed by Phillip. At a little wayside station far up in the northern country a number of boxes of game were found resting by the railroad track. The engineer made a mistake about the stopping point and pulled past the place where the goods were lying. The deputy, satisfied that he had found the contraband game, got off the train and seized the boxes. The arrangement of the agent for 1,000lbs. of freight was thereby somewhat disarranged. Local merchants at Tower and other points will be promptly prosecuted.

Illegal Deer.

A market hunter who has been killing illegal deer for a Chicago commission firm was last week arrested near Hermansville, Mich. This man had been in camp several weeks killing deer, but had only twenty-two saddles of venison on hand when he was arrested.

Selling Illinois Game.

Warden Loveday, of Illinois, this week prosecuted John Purdy, of Canton, Ill., for selling Illinois game. For this Purdy was fined \$25 and costs. He was then waked up with the other hand on a charge of having illegal game in his possession, which cost him \$55 and costs. Mr. Purdy now sleeps in jail.

As was stated last fall, Circuit Judge Ramsey, of Illinois, handed down a decision establishing the Illinois chicken law dates as Aug. 15 to Dec. 1. This question has not been taken to the Supreme Court, and Warden Loveday is going right ahead and finding men who began their chicken shooting in August. He has several cases at Sterling and Monmouth.

By the way, if Warden Loveday had been on the Chicago & Alton Railroad train between Chicago and St. Louis this week, he might have found a very nice menu on the dining car, which contained among other items the following: "Prairie chicken, half, with jelly, 50 cents; quail on toast, with jelly, 50 cents." Evidently this railroad should revise either its menu or its methods, and I trust Mr. Loveday will assist it in this regard.

Costly Rabbit.

A couple of weeks ago a Michigan man crossed the line and went into Ohio, where he shot a rabbit. It was not a rare or especially beautiful rabbit, but it cost him \$62.50, without counting his traveling expense or ammunition.

Topknots in Idaho.

A wealthy ranchman by name of John Sparks has imported 700 California quail, which he has turned down in Cassia county, Idaho. E. Hough.

1206 BOYCE BUILDING, Chicago.

Sport in Shanghai, China.

ONE OF FOREST AND STREAM's subscribers writes from Shanghai, Jan. 19:

"Just back from our annual shooting trip. Had fifteen clear days and bagged 297 pheasants, 44 geese, 54 teal, 5 mallards, 15 black ducks (yellow nibs), 28 woodcock, 19 partridges, 13 deer, 8 hares, 7 bittern, 7 snipe, 8 quail, 1 civet cat and 1 fox—507 in all, though we do not as a rule count snipe or quail in summing up the total of a bag. We had three guns in the party. The sport was not up to the usual standard. We found the birds uncommonly wild and scarce, and there were too many natives hunting for the market. They had reached remote localities where we had never before met them.

Massachusetts Rod and Gun Club.

The Secretary's Bulletin.

Boston, Feb. 10.—The last bulletin was dated Oct. 6; but although there are many things to tell, this one will be cut as close as possible, that members may read it through.

As was stated in our last report, the trial of Everett Horton came off Oct. 12, and his fine of \$40 and costs probably cut his net profits for the season considerably. He entered an appeal, but afterward paid his fine; we think he saved money thereby.

At North Easton last year's experience was not sufficient. Mr. Mackay has different ideas about game wardens who use the Wood roads now, and it cost him \$20 besides court expenses.

We had hoped to write of another party, but can only say that we met our match. It was a drawn game, however, as they abandoned their snares.

Since the annual meeting the cold weather and snow closed the time when snaring could be done, and your warden, although constantly on duty, had no special work to do until Jan. 12, when, in response to three appeals from different persons to stop the killing illegally of black duck in Plymouth Bay, he started for a trip among the ice cakes. Jan. 18 was cold on the bay, but Shute and Caswell found it colder and more chilly than their native New Hampshire hills on Thursday, the 27th, for \$10 each and costs was the verdict.

The annual meeting of the club was held on Thursday, Dec. 2, at Young's Hotel, President William Minot presiding. The treasurer reported: Balance on hand Jan. 1, 1897, \$441.02; received from assessments, \$900; received from Medford Shooting Club, \$26.39; total receipts, \$1,367.41. Disbursements: Printing, stationery, etc., \$25.89; legal expenses, \$69.50; railroad tickets, two at \$20, \$40; warden's wages, \$675; total, \$810.39. Balance Nov. 28, 1897, \$557.02. The secretary reported the past year has been one of prosperity, encouragement, work and success. Our membership is now 116.

During the year we have added thirty-seven new members, and nine have resigned.

Our club has lost, through death, Mr. Francis Tuckerman, Mr. Thomas Nelson and Col. William H. Forbes—all true sportsmen who joined our club to help on a good work.

We have been interested in five cases of violation of the fish and game laws, and conviction has followed in every case, with a total of fines of \$510.

Besides the above, in two cases it seemed best not to press law beyond true justice. The first was a case of partridges after Jan. 1, it being plainly shown that they were shot in open season in another State and taken home by a sportsman for personal use; the other, of one quail shot by a boy in the summer. Probably they will be more careful of the law in the future.

Also, over forty men found in the country with rods or guns have been cautioned and followed till they left for home.

In addition to members' subscriptions, our club has been honored by gifts of \$23.69 from the Medford Sporting Club, and \$10 from Hon. E. D. Buffington, Commissioner of Inland Fisheries and Game. We hope to appreciate and use these well; also to deserve and receive others still.

Our warden has worked hard and well, and has accomplished much, only a very small portion of which can be shown by bare recital of results. He has been at work constantly, has visited almost every township in the State east of Worcester, besides many others west of that city, and has dealt a blow to professional snaring which will show for years. If the work is continued and our stand of the past two years maintained, in a couple of years wholesale professional snaring will be dead.

We have run the club on "business principles;" we are respected both by sportsmen and by law-breakers; and the support given us by members and the public show plainly that our methods and work are appreciated. We entered our work with the promise that we would work first, talk afterward. I believe we have kept our first promise, and will leave the rest for others.

The following list of officers was unanimously elected: President, C. P. Curtis, Jr.; Vice-Presidents, William Minot, John Fottler, Jr., Henry J. Thayer; Secretary, Walter C. Baylies; Treasurer, William N. Lockwood; Membership Committee, Edw. M. Weld, William C. Thairlwall, William H. Aspinwall.

It was voted that at present the club consider that its work is in the field and not in the State House; that we use the tools provided for us, only hoping that the Legislature in its wisdom may give us better laws to work with and to enforce.

HENRY J. THAYER, Sec'y pro tem.

That Denver Barbecue.

Editor Forest and Stream:

In your issue of Feb. 5 it was stated that the National Stock Growers' Association at its recent barbecue in Denver advertised to serve buffalo, elk, antelope, mountain sheep and quail, and that the press dispatches said that such game was served in large quantities.

This statement is erroneous, so far as the previous advertisement by the Association is concerned. The newspaper reporters so advertised, but without authority. They are also responsible for the subsequent assertion that the game was served. The fact is that several half-breed buffalo, a bear and some "possums" were served, which was as near to serving "game" as they came.

We have some very active reporters in Denver, who do not always hesitate to elongate facts when they can make a sensation by so doing. They did this both in regard to the serving of game and as to the rush at the barbecue when one of the tables broke down; an affair which was not only greatly magnified here, but grew in magnitude as it traveled eastward.

These reporters are mostly young men from the East, and are at first so affected by the altitude that it is doubtful if any of them would be able to detect the difference between a Fort Collins lamb and a mountain sheep, if properly dressed and cooked.

The game law has been better enforced in Colorado during the past season than ever before, and it is quite certain that if it had been violated at the barbecue the Commissioner would not have overlooked it. There has been no game in the market this past season, and the small quantity served at the hotels, and which was imported by them direct, has got them into trouble.

If the hotel keepers could look ahead a little bit, they would see that if the game is protected until it increases there may come a time when it will be plenty enough to serve occasionally in hotels, whereas if the extermination for market continues it will be a very few years only when the annihilation will be complete, and it will not again be seen either at hotels or on private tables.

D. C. BEAMAN.

DENVER, Col., Feb. 22.

United States Fish Commission and Game.

THE House Committee on Marine and Fisheries has reported favorably on the measure introduced by Mr. Lacey, of Iowa, to add to the scope of the Fish Commission by authorizing it to introduce and propagate game in the several States. The report, which was presented on Feb. 23, reads:

The Committee on the Merchant Marine and Fisheries, having had under consideration House Bill No. 3,589, recommend that it do pass without amendment.

The Commission of Fish and Fisheries has been in existence for many years, and its operations have been in a high degree successful and to the great advantage of the people. Many streams that formerly teemed with fish had become almost or quite barren. New stock has been introduced, and the various States, recognizing the mistakes of the past, have enacted suitable laws for the protection of fish, and a healthy public sentiment has been created for their preservation and propagation.

The destruction among the game and other useful birds has been even more ruinous than that which has overtaken our fishes, and State laws for their further protection have been very generally enacted. The desire for restocking fields and forests is quite general, and with the machinery now in the control of the Fish Commission great good could be done with but a moderate expenditure of money. The bill has been submitted to the late Fish Commissioner, and he has expressed his warm approval of its provisions.

It is believed that birds may be successfully transferred from one part of the country to another, and there propagated and extinction of valuable species retarded or prevented. The beautiful and valuable grouse, now so plentiful in Oregon, could no doubt be successfully introduced into North Carolina and Virginia. The prairie chicken, which is becoming very scarce in the Northwest, would be welcomed with friendly enthusiasm in Eastern States, where it is now wholly unknown.

Birds introduced by the National Government, it is believed, would be protected by quite a different state of public opinion from that which has prevailed as to birds introduced by private individuals or shooting clubs. The wild pigeon, once so abundant, has been practically if not totally exterminated, and many of our most valued feathered friends are becoming so scarce as to lead to fears of their early extinction. Interest manifested by the Federal Government in the further preservation and propagation of birds will go very far toward a creation of that healthy public sentiment without which all protective laws are inoperative.

The farmers generally have become earnestly interested in bird protection, and the interest in the subject is no longer confined to sporting clubs, but the general usefulness of bird-life has become more fully understood by all people.

The proposition of the bill does not involve the creation of new officials nor large expenditures, but only authorizes an existing commission to perform additional duties, and the question as to the amount of expenditures for such purpose will always be under the direct control of Congress.

The future continuance of the efforts contemplated by the bill will depend upon the annual appropriations, which may be larger or smaller, as experience shall demonstrate to be wise.

Your committee heartily concur in recommending the passage of the bill.

Night Gunners in Maryland and Virginia Waters.

STOCKTON, Worcester County, Md., Feb. 21.—*Editor Forest and Stream:* I inclose you a clipping from the Virginia Enterprise, the county paper of Accomac county, Va.; this county joins our county, Worcester, which is the last on the eastern shore of Maryland:

"Wild geese and redhead ducks never were so plentiful as this year in our waters. Our sportsmen are making from \$20 to \$30 in a day and night. We do not say how they are doing it."

In last week's issue of FOREST AND STREAM was an article on the fine shooting in Chincoteague Bay, dated Jan. 31 of this year. It has about the same news as the Enterprise item, but fails to end with the same honest statement.

Now, for the benefit of the readers of FOREST AND STREAM, and also the vigilant game wardens, whose meetings we hear so much of in our paper, I will state that nearly all the ducks, geese and brant are shot at night with the use of lights of various kinds. The gunners themselves make no secret of it. Any of them will tell you how many shots they had, and the largest kill at one shot. During the full moon of the first two weeks of this month you could stand on my porch and count four, five, six, and even as high as nine, lights at one time. So anxious were they to get to work that the sun would hardly be down before the twinkle of lights could be seen; and this was kept up all night, as long as a duck could be found on the water. Night after night this goes on, not only this year, but every year; although I must say I never saw so much of it, or such open work, as this spring. I am told that there is a game warden on Chincoteague Island, where the most of the ducks are sold; but I cannot think this is

true, for the shooting is done so near the island that even with cotton in his ears he could not shut out the roar of the guns. Nor is this the only place, for the captains of our oyster boats tell of this night shooting all up and down the coast; yet I never heard of an arrest.

You cannot say in this case, inform on them, like illegal quail shooters. This needs no information; every one who has eyes to see, and ears to hear, knows of it. The ducks are brought in and sold, and the trip is talked of openly and without reserve; and as you see, even the papers write about it.

As for the fowl laws of the Eastern Shore coast of Maryland and Virginia, they are a farce, and the local game wardens are either wooden men or are in it themselves. I have always been a law-abiding citizen, obeying our game laws to the letter. With one exception I am the only one here who has always stood out firm; but I am tired of it. Last fall I saw the quail slaughtered for three weeks before the law opened, and never fired a shot. Last summer I saw the black ducks shot in August and September, and now I see the fowl all driven away, or so wild you cannot get a shot over decoys. Now mark my word, if this goes on next year, with no hindrance from State or county, you can just depend that fellow Foulks has a lantern, and is working it for all it is worth.

O. D. FOULKS.

Maine Snows and Maine Deer.

Boston, Feb. 28.—Reports continue to come in of terribly deep snows in Maine, and that the deer are suffering for want of food. One hunter writes from Piscataquis county that the snow is more than 5 ft. deep. Another report from the upper Kennebec says that the snow is the deepest for thirteen years, and that there is no chance for big game to exist. Then, worse than the deep snow, there is no doubt that a great many poachers are after the deer. A report says that the Commissioners have just sent out circular letters to the 1,400 registered Maine guides, asking them to do all in their power to protect the game, which is entirely at the mercy of the poachers. I am inclined to believe that the reports of the destruction of deer by poachers is true, for I have come across several saddles of freshly killed venison in the places of receivers in the Boston markets. These receivers and marketmen will not disclose the names of the shippers of the deer, though admitting that they must have been illegally killed, and that "they came from down East by schooner." One receiver admitted to me that there were a good many more coming than I had seen; that "it is a shame to kill them when they are so thin and poor; they bring next to nothing." It is a shame that this illegal shipping of game to Boston by schooners and other small coasters cannot be stopped. No railroad or respectable express company, by water or otherwise, will forward game out of Maine illegally. I believe that the settlements along the coast, particularly in Washington county, are mainly responsible.

I have seen a letter from a guide in the Rangeley region, written a few days ago. He had just been into camp to put in wood and ice. He says: "Talk about deer! They have yarded right back of your camp; a lot of them. We saw them almost every day. They come right down around the camp and wood shed. The wire fence you had around the garden to keep the rabbits out, the deer have broken all down." The owner of this camp got two fine deer last fall simply by being out with rifle in hand in the morning; all he desired, even had the law allowed him a dozen. The remarkable feature is that a few years ago there were very few deer in that section.

SPECIAL.

BREWER, Me., Feb. 26.—*Editor Forest and Stream:* I suppose you may wish to know the truth about how our large game is faring in this deep snow. What one reads in the papers is no more reliable than the Cuban reports. The most who write for the papers have not been in the woods, and simply lie for the sake of seeing what people can be made to believe. I think that our large game has suffered very little, except from inconvenience in getting around. One correspondent writes terrible stories of great slaughter of deer and moose in Washington county. As there is record of only one solitary moose being seen in Washington county for several years, one can judge of the truth of the other part. The fact is, Maine people do not hunt in these deep snows for fun. The skins of good fall deer are utterly unsalable now. They cannot be sold here at 10 cents each. Winter skins could not be given away. Any fair hunter can kill deer much easier on light snow than in deep snow, unless he uses a dog. The moose are very well looked after, and there is no danger of any one killing caribou.

There is simply no object in killing, except for meat to eat. Some will be killed for this purpose, as many back settlers are literally snowed in, and will suffer for food.

The only case I know surely of a deer being killed was that an Indian killed one for food. There were fifteen in the family, and very little to eat. The wardens arrested him, but he was not fined, as he ought not to have been, for the State would have had to feed the family.

The amount of game killed this year has been greatly overstated—purposely. The railroad fall report gave as shipped deer 3,058, moose 100, caribou 64. A great many of these are counted twice—two saddle counts, and then the head is counted. Also, New Brunswick moose are counted which pass this way, and New Brunswick, Nova Scotia and Newfoundland caribou heads which are received for mounting in Bangor all count. The railroad shipment embraces about all the deer killed by guides and hunters near the railroad, and lots sent to market. Very few deer are eaten in the woods. The forequarters are eaten and saddles saved.

There is one point overlooked—the wounded which die. I believe that 5,000 will more than cover every deer killed and secured in this State; I think it too large an estimate; but certainly 1,000 is low enough for the wounded, a large part of which die. The count of moose and caribou is plenty large enough.

The snows will allow the lynx and fisher to kill many deer; but the excessive killing of wildcats for bounty will save hundreds of deer near the seashore.

M. HARDY.

Doves in Iowa.

VINTON, Ia., Feb. 23.—*Editor Forest and Stream:* Mr. Hough says that Mr. Hunt, of Burlington, Ia., has introduced a bill in our Legislature making doves a game bird, with an open season from July 15 to Sept. 1. If that bill creeps through our Legislature it will be because the people do not know about it; and I can assure the sportsmen of Burlington that at the next sitting of our Legislature it will creep back again.

Throughout the State of Iowa mourning doves lay eggs and rear their young all through the open season mentioned in that bill, and it would be as cruel, cold-hearted, wicked and unsportsmanlike to shoot them as it would be to shoot prairie chickens and quail during the months of June and July. They are a dooryard bird, and do no harm in any way. They and the blackbirds are the last to leave us in the fall, and more or less of them always make an attempt to stay with us through the winter. We have had snow enough to make sleighing since Dec. 3, and on Dec. 14 I counted twenty mourning doves and one crow blackbird feeding in my stock yard. At this date the blackbird has disappeared, and the flock of mourning doves has decreased to twelve. Shall we for the sake of "fun" begin to exterminate our dooryard birds? I intimated not long ago in *FOREST AND STREAM* that "the pismire age is approaching; it is almost here," but it will never fasten its clutches on the State of Iowa without a struggle.

I feel greatly interested in game matters, but instead of the Hunt bill I would like to see one passed providing for a salaried warden for each county, and for stocking the State with game. I am glad that I can deny myself the hellish enjoyment of shooting song or dooryard birds, and leaving their young to die. MOUNT TOM.

The Maine Cow Moose and the Boys.

BOSTON, Feb. 28.—Commissioner Carleton has appeared before the Governor and Council in defense of his action in allowing the boy moose-killers to escape. So far as I am able to learn, his action will be sustained. The Commissioners are understood to set up the claim that they stand in the position of a judge or the Governor, with the right not to enforce the game laws, if they see fit.

SPECIAL.

A Bangor correspondent writes: "There is intense feeling regarding Mr. Carleton's action in the student moose case. The fact cannot be put away that he took the oath to enforce the laws, and on the first case of illegally killing a moose made a printed statement that he would resign before he would do it. He has done many good things, and I am sorry he has failed in this. No one wished the boys sentenced to the full extent, but every one (or almost every one) feels that they should have been brought back to stand trial, and if convicted have had a nominal sentence passed. It will be hard to get any jury now to convict one of our citizens. In the Moosehead case, sometimes called the Harrington case, there is more than a reasonable doubt that the cow moose shot in open season was killed on purpose. Half a dozen men are shot for deer every year, and no questions are asked; the chances when following a moose track to shoot a cow for a bull by mistake are very much greater."

Spring Prospects.

Editor Forest and Stream:

A week ago last Sunday, which was very pleasant, while strolling through the woods and fields here, I was much surprised and gratified at seeing so many bluebirds in comparison with the numbers that I had seen during several years past. Should think at a rough guess that I saw on that day as many as twenty. Am greatly pleased that so many comparatively are showing up, as I had begun to think that that species of our songsters was nearly extinct. Also have seen more or less of them this year before and since that Sunday. Also saw that day a very large flock of crow blackbirds.

The prospects around here for shooting next fall now seem to be fully up to the average, as several of the local sportsmen and farmers report having seen a goodly number of quail since Jan. 1. Have myself in my wanderings in this part of the State seen several good-sized remnants of beves of birds, enough for the nuclei of large flocks next fall, weather during the remainder of the winter suitable.

A. L. L.

MILHURST, N. J., Feb. 21.

The Boston Exposition.

THE New England Sportsmen's Association is making excellent progress with its exhibition. Among the late accessions to the exhibit is a live beaver or two, secured by Dr. Bishop in New Brunswick. It is understood that the Maine Commissioners declined to have the Maine beaver disturbed, even for exhibition purposes. The anti-announced are arriving, and are in prime condition. Not only are sportsmen, but the public schools are to be interested.

SPECIAL.

North Carolina Quail.

GARFIELD, N. C., Feb. 18.—Mr. G. Harry Squires, of the firm of Henry Squires & Son, of 20 Cortlandt street, New York, has just left my place after spending a few days of very nice quail shooting.

Quail are still plentiful, and there is no doubt but that next fall we will have better shooting than we have had in years, provided we have a good breeding season.

A. H. GRAF.

Pennsylvania Game.

MONROE COUNTY, Pa., Feb. 14.—The game has wintered well in this locality. Ruffed grouse are plenty. The foxes and catamounts have destroyed a great deal of game; and we have destroyed them to some extent. My son and I have killed seven foxes and four catamounts, or bay lynx.

H. T. FRANKENFIELD.

Dimensions of Ruffed Grouse.

MR. JUSTUS VON LINGERKE, of 318 Broadway, New York, was responsible last season for the death of a very large number of ruffed grouse, the majority of them killed in Sullivan county, N. Y. The largest grouse he killed during the season was brought to bag on Dec. 11; as the size and weight of ruffed grouse are often under discussion the following figures and measurements are given:

Weight exactly 2lbs.; total length from tip of the bill to the tip of the tail, 19 $\frac{1}{4}$ in.; spread of wings, 24 $\frac{3}{4}$ in. Judging from the length and color of the tail, the latter being gray and chestnut mixed, and also from the appearance of the legs, the bird is supposed to have been a very old one.

Yellowstone Park Transportation.

Editor Forest and Stream:

My attention has been called to an article in your issue of Feb. 5, 1898, entitled "Nuisances in Yellowstone Park." If your paper desires to be fair, there are statements made in that article which you will be pleased to correct.

I send you herewith copies of briefs submitted in my behalf in the case now pending before the Department of the Interior, which were prepared from the record there, and show the falsity and injustice of the statements to which exception is taken.

My business in the Park dates back to the season of 1880. Since June, 1896, I have maintained during each season tent stations, at four different points in the Park, for the accommodation of my patrons. My tents are clean compartment tents, and the only wooden structures consist of two neat outbuildings at each camp. No other permanent structures have ever been built or used by me. Neither has permission ever been sought to maintain other than the character of facilities for the shelter of patrons which I have. Each of these camps is located in secluded spots, and so far as I am able to learn, no objection has ever been made by reason of any litter or odor at any of these permanent tent stations; and such objection could not be sustained by facts.

After the most open hearing when all of the interests of the Park were represented, and late Acting Superintendent George S. Anderson was present, my plan was fully discussed before Secretary Hoke Smith and the then First Assistant Secretary of the Interior, Gov. William H. Sims, and it was decided in 1893 to permit me to do this business upon a one-season tenure. I would not go to the necessary expense without a promise of renewal, which was given in the spring of 1896 by Acting Secretary Sims. This is the last time that Gov. Sims acted in the matter, and was long before my employment of Mr. George H. Lamar as my Washington counsel, being then represented by another attorney.

It is true that Capt. Anderson opposed the renewal of my license in the spring of 1897; that the Northern Pacific Railway Co. circulated just such a false statement as you have published, to the injury of my business in 1897. I exercised my right to employ such attorneys as I pleased. I chose Mr. George H. Lamar, of Washington, D. C., and James A. Blanchard, of New York, whose several ability and high standing in their profession requires no defense at my hands. Secretary Bliss' action in my favor was in harmony with the written promise of his predecessor and the wishes expressed in writing of many of the best citizens of this country, including prominent representatives of the League of American Wheelmen, the clergy, college professors, etc., most of whom had patronized my camps during the season of 1896, and knew whereof they spoke.

You will see that Secretary Noble's action, to which you refer, had no reference to the camping business, and was particularly aimed at the Northern Pacific combination, against which monopoly Congress and the Department "has been always contending."

Relative to your prediction that "if Col. Young's opinion should be sought in this matter," "he would be bitterly opposed to the nuisance which Wylie intends to establish," attention is called to the report of this very officer (p. 18, brief of Dec. 11, 1897), dated Oct. 26, 1897, made specially upon my camps, in which he says that "there exists an undoubted demand for such accommodations and services as Mr. Wylie seeks to render," and recommends the department to "require" their continuance.

In view of the injury which might logically result from your publication, it is felt that fairness and justice would require such space in your columns as may be necessary to refute the untrue statements therein contained.

W. W. WYLIE.

HELENA, Feb. 17.—*Editor Forest and Stream:* Under the caption of "Nuisances in Yellowstone Park," in your issue of Feb. 5, you strongly protest against Mr. W. W. Wylie's permanent camps in the Park, and you state what doubtless appears to you good reasons for your protest. To one living near the Park, and who has visited it recently, and who is, therefore, familiar with this Park question, your editorial is quite inexplicable.

I have been an occasional reader of your very valuable paper for a good many years. I know the high regard and appreciation in which it is held by the true sportsmen of this country. I have always considered it eminently fair in its criticisms of men and measures, but in this instance a very great injustice has been done Mr. Wylie and his thousands of friends scattered over the entire country.

You are entirely in error in your statements regarding the Wylie permanent camps. This can readily be shown by thousands of our best citizens who have made the trip through the Park with the Wylie Camping Co. In your own imperial city where your valuable paper is published are many most excellent people who have made the trip with this company, among the number an editor who will quickly satisfy you that you have been grossly misinformed in this matter.

Knowing the reputation of *FOREST AND STREAM* for fairness and reliability, I ask you to give space to this

communication—not for the purpose of advertising either the Wylie Camping Co. or the Transportation Co., for I have no interest in either, but for the purpose of doing justice.

The granting by the Department of the Interior of the permit for these permanent camps is not a "retrograde step," but a step forward in the interests of the people, very many of whom prefer this method of doing the Park to any other. I know this to be true from conversations I had last summer in the Park with tourists traveling with both companies. Those who have visited the Park enthusiastically indorse the policy of the Department of the Interior in refusing to fly in the teeth of the acts of Congress and grant exclusive Park privileges. The Park belongs to the people, and its great privileges as well. To foster or create Park monopoly in transportation, or in anything, would in my judgment turn the many from the Park, and only the favored few would visit it.

It is true, as you state, that the Interior Department has not respected the recommendations of any officers who has acted as superintendents of the Park, and it is greatly to the credit of the department that it has not. Especially is this so when the well-known fact is stated that the former Superintendent of the Park was most bitterly opposed to Mr. Wylie and his method of doing business, and for no reason that he has, as yet, been willing to give. No good reason can be given why these camps should be prohibited. Objections made by Park superintendents have been proven, upon investigation, to be utterly unfounded. Why Park superintendents continue their objections to camping is best known to them; certain it is they have never given the department nor the public any valid reason why these camps should not be allowed.

"You say: 'This having been granted him' (referring to his license for permanent camps), 'he erected a number of very flimsy board outbuildings, and later other very temporary shacks, log cabins, or huts, in which his passengers might sleep.' Nothing could be further from the fact. The permanent camps are constructed of the very best tent material. The beds and cooking compare favorably with similar accommodations in first-class hotels. There are no 'temporary shacks, log cabins, or huts.' The outbuildings are made of boards, and so are those of the Transportation Co. Indeed, those of the latter company, in some instances, are placed near the highway for the express purpose of being seen and easily reached. These permanent camps are kept free from all refuse and debris. Inspection each day is made by a soldier for the express purpose of seeing that the camps are kept cleaned up.

These camps, instead of presenting an unsightly appearance, "which can be compared to nothing so well as to the buildings of the old-fashioned shanty town that once existed on the rocks in New York city," are always neat and pretty in appearance, and afford a cheering sight to the traveler, wearied with the solitude of the never-ending "primeval forests" of the Park.

Come and visit the Park, and you will find all the corroboration for the foregoing that is needed. Do not be misled by those who, for selfish reasons, attempt to deceive the public in this matter.

It will be most fortunate for the people when our Government grants exclusive privileges in the Park, and thus insures a complete monopoly of all hotel and transportation privileges.

I send you a copy of our daily paper, which has an editorial confirmatory of our statements.

Thanking you in advance for your courtesy in publishing this communication, I remain,

E. A. CARLETON,
Superintendent of Public Instruction.

HELENA, Mont., Feb. 21.—*Editor Forest and Stream:* The undersigned committee, composed of members of the Montant Division, L. A. W., has been appointed by Chief Consul J. A. Shoemaker to formulate and forward to you a reply to the article entitled "Nuisances in the Yellowstone Park," in the issue of Feb. 5 of *FOREST AND STREAM*. This committee is composed of members who have made the trip through the Park by wheel, some of them stopping at the Park hotels, and some stopping at the Wylie permanent camps.

The article in question is so manifestly unjust, in that its statements regarding the permanent camps are wholly incorrect, that we feel a reply should be made; and we therefore respectfully request you to give space in your columns to this communication. We do this not because we have a cent's worth of pecuniary interest in any transportation company now doing business in the Park, nor because of a desire to advertise the Wylie Camping Co., but we are led to make this reply, and to ask of you the courtesy of publishing it, simply out of a desire to see justice done to a gentleman who has done as much as any citizen in this country to make known the marvelous attractions of Wonderland. We believe in fair play, and knowing the reputation of *FOREST AND STREAM* for fair dealing and reliable utterances, we confidently believe you will not deny us the privilege of stating through your columns the "other side of the case."

The criticism of the Interior Department, of its policy in granting to Mr. Wylie a license to establish permanent camps in the Park, is unjust to say the least; and the statements regarding Mr. Wylie and his business are wholly unwarranted and erroneous. Instead of the "flimsy outbuildings and other very temporary shacks, log cabins or huts," there have been erected large and commodious tents, comfortable and convenient in their interior, and presenting an exterior which adds rather than detracts from the appearance of the neighborhood in which they are situated. There never has been erected by Mr. Wylie a "log cabin, shack or hut" of any kind. His large and sightly compartment tents are supplied with most of the conveniences found in a well-regulated hotel. They are warmed by stoves, furnished throughout with toilet articles, such as wash stands, towels, hair brushes, combs, etc., and the beds are as comfortable as those found in the hotels of the Park.

You state that "it would be practically impossible to such permanent camps properly, and that the littler that would inevitably collect around them would be an eyesore and an offense to all travelers through the

Park," etc. It is clear that in regard to this matter you have been misinformed. Mr. Wylie's camps are located within easy reach of the soldiers' quarters, and these soldiers give frequent inspection to his camps. They of course have full authority to enter his premises at any and all times, and this freedom of authority is not only cheerfully accepted, but invited, by Mr. Wylie. No refuse or debris of any kind is ever seen by the traveler around these camps. Their cleanliness and general attractiveness are matters of common remark on the part not only of those who stop at them, but of hundreds of tourists who make the trip by the other method.

Our experience has shown that the reason so many people make the trip through the Park by wheel is because they can do so more economically than by paying the regular stage fare; and this being true, they naturally prefer to stay at the Wylie camps for a consideration of \$2.50 a day rather than pay the hotel company \$4 a day.

Aside from the monetary aspect of the case another great desideratum is that when a bicyclist makes this trip by wheel he does it not only for an outing, but to get away from the usual routine of petty constraints and conventionalities. He would rather not go through the Park at all than at the end of each day's ride be reluctantly constrained to go through the prosaic and, to him, too civilized formality of "dressing for dinner" before he can satisfy his bicycle appetite.

The very fact that these camps are so liberally patronized by wheelmen is evidence that there is a substantial demand for them. We do not hesitate to say that with these camps discontinued, and no other accommodation to be had except the \$4 a day hotels, more than half of the bicycle travel in the Park will cease. On the contrary, should they be continued, the Park trip, from the point of view of the bicyclists, would in the near future become one of the most justly celebrated and popular bicycle trips to be had in the United States.

From the point of view of the constantly increasing number of bicyclists who make this trip every year, nothing could be more harmful than that these camps should be discontinued. Respectfully,

GEO. H. TILLY,
L. P. SANDERS,
P. G. SCHROEDER,
CHAS. F. WARD, } Committee.

Sea and River Fishing.

Men I Have Fished With.

LXII.—Wallace Eugene Blackford.

If the stork had been kind to me and brought a boy to our hearthstone that grew to be such a boy as Wallace Blackford was, I would have reason to be proud. Probably the stork knew best, and selected only girls for me, arguing that if I had a boy he would be off in the woods with rod and gun, and be instructed about birds, beasts and fishes to the neglect of other things. Certain it is that a little difference of forty years in our ages did not prevent a close and loving friendship which was broken only by that reaper who harvests the unripe as well as that which is ready to be gathered.

In the spring of 1884 his father, Hon. Eugene G. Blackford, then one of the State Fish Commissioners, said to me: "I have a boy about thirteen years old who wants to take a trout. He wants to begin at the top and take it with the fly; can you take care of him and put him in the proper shape to do it?"

"Is he strong?"

"He is very strong for his age, and is fond of athletic exercises in the gymnasium; he is a good boy, and if you like good boys you'll like him. Why did you ask about his strength?"

"Merely to know if he could handle my favorite rod, which is not a light one, or if I should unpack some boxes to hunt for some lighter rods, which I seldom use; that's all."

He came down to Cold Spring Harbor, Long Island, one Friday afternoon in April, shortly after the trout season opened, and was impatient for the morrow. He wanted to know how big the trout grew in the large private mill ponds belonging to the Jones family, as undivided property, and in which I had been accorded the privilege of fishing. He was curious to know who had taken the biggest fish, and when; how many trout could be taken in a day, and his enthusiasm was not only charming, but contagious. What his dreams were that night we can only guess.

After he retired I got out the rod, my 10½ oz. split-bamboo, which is my favorite to-day. I had carefully looked the boy over; he could handle that rod, and if he learned to cast with it he could easily get down to a lighter one, for at that time anglers were using rods of half that weight, and were trying to get a practical rod which would not have any weight. While I believe in light rods for those who have no muscle, and who do not care to develop muscle, I prefer to use a rod that makes my biceps sore after a day's casting, but hardens it in a few days. Therefore I did not search for lighter rods for the boy, but looked the old one over for abrasions of the varnish, faults in the rings or elsewhere; oiled the reel, tested the last 10 yds. of the tapered silk line, soaked the gut leaders for an hour, and then tested their strength and put them away in the box between sheets of damp felt; looked over the fly-book, and journeyed to the land of Nod, where there are not only trout streams, but mines of gold and precious stones, fame, fun and all things which mortals pursue in the mad race of what we call life; a race which sometimes ends in fruition and sometimes in the penitentiary or the lunatic asylum. One generation after another repeats it, learning nothing from those gone before, because each individual considers himself as a special creation, wholly distinct from the great herd. Dreams are not, as Churchill said, "children of the night, of indigestion bred," nor are they, as Mercutio says, "the children of an idle brain," for they come when the brain is busy, and all other parts of the body are at rest and the brain

is at work. If I dreamed that night, there is no remembrance of it, but there is not a doubt that dreams came to my boy guest.

His breakfast was a light one, he was anxious to meet his first trout, and when we reached the dam of the lower pond, where there were no trout, I said: "Wallace, your father told me that you were ambitious to take some trout with the fly; can you cast the fly?"

"I don't know; I think I might, but I've never had a chance to fish with the fly, and only know, in a general way, that fly-fishing is the correct thing for taking trout. How do you do it?"

I found a place free from bushes on the dam, oiled the ferules of the rod in my hair, put it together with reel, line, leader and one fly. "Now," said I, "let me see you cast the fly." He tried to get it out in many ways, but failed; the leader had an annoying way of coming back in his face or of twining around the rod, and after awhile he said: "Let me see you do it!"

He watched the line go on the back cast and then straight out 60 ft., and thought he could do it; but when I called attention to the fact that the whip-snap sound behind him told that the fly had been whipped off, he took hold of the principles of fly-casting, and in less than an hour could get out 40 ft. of line without cracking the fly off on the back cast. I have had many pupils in the art of fly-casting, but never one like this, and we went through the woods on the west to the lower end of the upper of the three ponds, where there was a dam with a long apron and but little water running over it.

WALLACE E. BLACKFORD.

Here he lost a fly in the brush on the back cast, and was admonished to retrieve over the other shoulder, and it did not happen again.

The scholarly angler knows the picture "Steady, Johnny," where the boy with wrinkled brow is straining at a rod which presumably is connected somewhere with a salmon, while the old Scotch fisher rests his hand on the boy's shoulder to restrain him. We would have made a similar picture, if not so picturesque, when Wallace hooked his first trout. He had made several casts, and probably wondered in a boyish way why a trout did not rise at each, but a trout did finally rise, snatched the fly, and the reel was singing merrily when I called: "Check him before he gets into the weeds." And then the fight began. Wallace was disposed to reel the trout in at once, despite its rushes, and I put my hand on his shoulder and gave advice, "Give line," or "Reel in," as the fish rushed or weakened, and when the trout was brought into the shallow at the crest of the dam and Wallace said, "I've got him now, and he is a beauty," there was a rush and the rod bent almost double before I could say, "Let him go!" This was repeated, but the third time the fish was brought near the crest of the dam I netted it. Wallace was pale and trembling with excitement, and said: "It is a beauty, and must have fought me over an hour. Do you think it will weigh 2 lbs.?"

It is not always agreeable to dispel a boy's illusions, and tell him Santa Claus does not come down the chimney; it is safe to infer that he will learn that by degrees, passing through the state of doubt to positive knowledge, as he acquires years; but I could not resist telling him that my watch said the fight had lasted through eleven minutes, and the fish would probably pull the scales down to the ¾ lb. mark. To me this was more pleasure than to take a hundred trout. The excitement and enthusiasm of this boy with his first trout was contagious, and stirred the blood of an old fellow to whom such contests were common, but were always enjoyable—but not with the freshness of youth. I always loved a boy who was companionable and wanted to learn things which I happened to know, and who placed implicit confidence in his instructor. It reverses the condition, for when I was a boy I sat, figuratively speaking, at the feet of "Old Port" Tyler, the professional hunter and trapper, and learned the ways of birds, beasts and fishes from what I believed to be the fountain-head of all such knowledge, and to whom I gave attention such as no instructor in "readin', 'ritin' and 'rith-metic" ever got.

After a few trips to these Long Island ponds my young friend became ambitious to essay the Adirondacks, and a couple of years later we found ourselves at the Mountain Home, on East Canada Creek, near Morehouseville, N. Y. He was now a good fly-caster and brook trout angler, and we fished that stream from Ed Wilkinson's, some ten miles below, to almost as many

miles above, with varying success, taking many other species than trout, such as chub, red-fin shiners, etc., for all of which Wallace entertained great contempt.

He had been listening to some fishing talk in the hotel, and said: "I want to go over to Pine and G lakes, about three to five miles, and fish for lake trout." The wilderness was new to the boy, and his enthusiasm was intense. He wanted to know so many things: "How far do you have to go before you get where the deer are?"

"They are on all these hills; we have passed several deer tracks, but the deer are not apt to be seen by men who talk as much as we do, and most of them are lying down on the hillsides now. This is a well-beaten trail that we are on, and the deer know that men are apt to be on it at any time, and they avoid it as much as possible; but they cross it at times, when necessary."

"Do deer know that this is a path where men go? They surely can't know all the paths in these great woods."

"They surely do. If not run off by hounds, a deer might spend its whole life within a five-mile square, ranging for food or water at different seasons, and would know almost every square foot of it. It is possible that several deer have heard us, and as we kept on the trail they kept still where they were lying and resumed their cud-chewing or sleeping as we passed on. Here is a track; a big buck passed here within twenty-four hours."

And then I had to explain how I knew all this, and play schoolmaster to an eager scholar. I rather like that sort of thing, if a boy takes real interest in the ways of beast and bird, and so we walked and talked until we reached the lake, and found where the boat was hidden. The trout were not rising well, and by noon our catch was two small ones and three fairly large chubs; the whole lot might not have weighed much over 1 lb., but it was time to eat after such a walk as we had, with its trips around uprooted trees and over fallen logs, and I had provided for just such an occasion. A frying pan, coffee pot and tin cups were brought out of a basket, and it was fun to see Wallace hustle around for dry wood while I cleaned the fish. There is a vestige of the nomad left in all of us, a heritage from our wild ancestors which breaks out in civilized man in various ways, and if it does not impel him to live in the woods all his life, as it sometimes does, it tempts him to seek their solitude for rest and recreation; or if this is denied, by reason of lack of time or means, then comes the desire for the excursion, the picnic and the clam-bake on the shore. We all have it, the difference being not in kind, but in degree—a trip to the beach for a day, or a similar outing on a lake or stream being satisfactory to one, while nothing less than a fortnight of life under bark or canvas is satisfactory to others.

Said Wallace: "That frying pan is without a handle; you can't fry fish in that! And, say—you aren't going to eat those chubs, are you? They never send chubs to market, and I wouldn't like to eat them. How are you going to make coffee without a tea kettle to boil the water in first? How long will it take to get dinner? I'm just about as hungry as I can get. Open that basket and let me get at what there is in it."

Before he had finished his questions a wooden handle had been put in the frying pan, and this diverted his attention from his hunger; the water was boiled in the coffee pot and the coffee put in; the fish were fried in salt pork fat, and then the basket was opened. On the birch-bark plates I served him the two small trout and I took the chubs. After the fish came cold boiled ham, broiled chicken and the accessories which go with an *al fresco* lunch, and the amount of edibles that this growing boy put out of sight that noon would have astonished a Maine lumberman.

Dinner over, he wanted to get out on the lake and troll for the big lake trout, of which he had heard; but I said: "No, my boy, we spent part of the morning in getting here because we did not start early, and had only time to try for a trout or two for dinner in the worst part of the day. It is still the worst part of the day, and we may as well rest; and for myself, I propose to crawl into this bark shanty and sleep for an hour."

"Sleep!" said Wallace. "Well, you can sleep if you want to, but I came here to fish, and I'm going to do it."

The sun was hastening into the west when I awoke. It was Wallace throwing the oars into the boat, and that is a sound that seems to fill you ear longer than a rifle shot. He looked disappointed as he said: "I've cast all kinds of flies around this lake, and in the middle of it, and only got three rises, and they were chubs; here they are, but I'll not eat them."

"Come and sit down and rest; in half an hour the sun will be over that mountain, and the lake will be in shadow. Then the fish will wake up, and we will go out and troll for the big lake trout, come in and eat our supper, and get back to the Mountain Home by 9 o'clock. But it will give us more sport if we sleep in this shanty to-night and get out on the lake at early daylight, when the fish are stirring for food. I've got all the necessary provisions, with what we are sure to catch, and a fire in front of this open shanty will keep us warm."

Wallace was a city-bred boy, and imagined all kinds of danger. I told him that the dangerous snakes lived in warmer countries, and that north of Florida no snake was awake at night; that bears and other wild beasts would not come near a fire; but it was no use. I don't think that he doubted my knowledge of these things, but there was an undefinable dread of the wilderness at night which made him prefer a roof. I wanted to stay at the lake, and had prepared for it, but would not insist upon it, and along about 4 P. M. we started in to troll for lake trout. On stiff trolling rods we trolled 202 sinkers, beyond which, at some 10 ft., was a hook baited with a chub, and as we were fishing in 40 ft. of water it was not exciting sport, and I said so to Wallace as I rowed along.

"Well, it's not fly-fishing," he said, "but I want to get a big trout." And he did. He got a strike and reeled in, saying: "That sinker is so heavy that I don't know if the fish is on or not. Yes, he is; I felt him wiggle just now; but it's only a little one." He brought up a laker that weighed close to 8 lbs., and remarked: "That's poor fishing for a fish of that size. Why, I'd rather take a 40z. brook trout on a fly rod than a dozen such lazy things, and with something less than a ton of lead to troll."

"I thought you would come to that opinion, my boy; but you wanted to try it, and are satisfied. The sun is now below the treetops, and we can just about make the Mountain Home in time for supper." We hid the boat and oars, and started, he on the lead, and before we had gone a mile a ruffed grouse got up with a thunder of wings and was lost in the woods before he could see it. He made a big jump and enjoyed his alarm when he learned the cause.

Wallace came down on Long Island very often and stayed several days with me, and he was growing in strength as well as in years. He wanted to contest in the fly-casting tournaments in Central Park, and I put him through a course of training for the purpose; stood on the bridge with him and coached him; "A little more time on the back cast;" "Keep your fly up; throw up as well as back, and keep it off the water behind you;" "Your rod is thrown too far back;" "Count one, two, three, and take as much time on the back cast as on the forward," etc., and so I kept him at it until he could easily beat me. He cast in the tournaments for at least two years and made good records, which are not at hand as I write, and my favorite old 10½ oz. split-bamboo had the hardest service that a rod can get in this work; but it is as good to-day as ever, and Mowry won a contest with it in the tournament last month.

As he grew older I saw that he had great mechanical ingenuity. He was an expert amateur photographer, and made his own cameras. He was also an artist in oils, and made some creditable paintings at the early age of fourteen. He graduated from the Adelphi College, Brooklyn, in 1891, and after a few months' supervision by his father the latter turned over his large business in Fulton Market to him, in order that the father might attend to his banking and other business. After a year at this work, Mrs. Blackford, his mother, joyfully told me that Wallace had made more money in the market in the past year than his father ever did in the same time. It was with a full knowledge of the character of this boy that I wrote the first paragraph of this sketch, and lamented that the stork had not been equally kind to me. Yet, while we know that it is as natural to die as it is to be born, in some cases the reaper follows the stork at a cruelly short distance.

Wallace was born on Dec. 4, 1871, and was married on Dec. 4, 1893. It was a large wedding, in church, and Mrs. Mather and I were there, and also had cards to the house reception. Our seat in the church was far back, but we could see that Wallace was not well, and that after the ceremony he was hurried from the church. Albert Haley gave me the first hint that pneumonia threatened the bridegroom by saying: "It's too bad, Fred; I'd as soon give up a boy of my own as to give up Wallace."

"Do you think he is dangerously ill?"

"Yes, I do; but I hope he will pull through."

At the house reception Wallace was not to be seen. He had been ordered to bed by the doctors, and we hoped that he would baffle the reaper with his vigorous physique, and we enjoyed the music and the feast and then went to our Long Island home.

A week later, Dec. 11, a message came: "Wallace E. Blackford died to-day." The missive was put in a volume of Longfellow, on the page wherein he says:

"O, what hadst thou to do with cruel Death,
Who wast so full of life, or Death with thee,
That thou shouldst die before thou hadst grown old?"

FRED MATHER.

Jugging for Catfish.

"Just About a Boy," by El Comanche, and its incidents of the lancewood rod, the black poney, and others, bring back memories of my boyhood days; and I think I now have, and have used constantly since (with only the breakage of one tip) the mate to El Comanche's rod, spoken of in his first paper. I have also taken "cats" from that 3-pounder hole, and also have fished those riffles below the old walnut trees of "Penners" pasture; and as I sit in my study this cold winter's night, with the wind howling round the house and piling the snow in huge drifts, there appears to me through the smoke clouds from my pipe a picture of long ago.

It is September, and I see two black canoes slowly paddled side by side over the calm waters of the river by two stalwart youngsters wearing sombreros, and tanned the color of "Otoes." They are talking to each other in siawash as they glide past Beaver Island to the long reach of the river below the pontoon bridge. "There, by that old stump, last week I took a big 'cat,' and maybe we'll get another on our way back," says the larger of the two boys. "Maybe," I say; "let's go 'shore and get some 'hoptoads' for bait." A little further and we run the canoes ashore and are filling our live boxes with frogs.

"Guess we have enough; let's klatawa," says my chum.

Now, readers of our family paper who have never been "jugging" for catfish, come along with us this afternoon, and I will guarantee you a good time. We each have a dozen empty beer bottles, tightly corked, to which about 3 ft. lines are attached. Baiting the hooks with frogs, we drop these overboard in line of battle across the river, and let them float with the current, while we follow along behind. Lighting our pipes, we watch for the first cat to tip up a bottle. Nothing but the releasing of a line from a snag or a bottle running among the branches of a willow that touches the breast of the slowly flowing stream occurs, till we get opposite the old submerged stump alluded to, when one of my bottles begins to bob up and down, and vanishes from view. I clear for action at once, and with a few strokes of the paddle reach the place where I last saw the bottle. Backing water, I wait for it to rise, for it takes an extra large fish to hold one of these bottles down for long. It soon rises close to the canoe, and grasping it, I pull into the well a fine catfish of 3 or 4 lbs. weight.

But my triumph is short-lived, for, hearing a great commotion in the direction of my chum's canoe, I turn and watch the fun. He evidently has a good one, for he is leaning over the side with both arms submerged to the elbows, and is trying to get hold of its gills. He

looks up from under his sombrero, and with a broad grin on his sunburned face says: "If the durned hook doesn't pull out or break I'll sure get him; he's a whopper—'bout s'teen pounds." Inch by inch he gains line, and with the water swirling and a broad tail churning it into foam there comes to the surface, still fighting, although two strong hands are fastened in its gills, a massive black head, followed by the body of a catfish that when held up to view will weigh at least 10 lbs. "Geel! ain't he a dandy, eh?" comes across the water.

But I am too busy to reply, for two of my bottles are bobbing and starting in opposite directions, and must be attended to. The result is one "cat" of about 1 lb., and the other is a small bullhead; nothing else is caught until after we are by Beaver Island, when we have four bottles going at once, and things are quite lively till we near the ice-houses, when we gather in our bottles, turn loose the rest of our frogs and quietly float down to the boat-houses, comparing notes meanwhile. On landing and counting our fish we find we have just thirteen; although this is an unlucky number, we are much elated over the afternoon's sport, which is another page added to life's diary. May all our friends of FOREST AND STREAM be blessed with such pages, that in after years, when in the midst of business cares and worries, as they are smoking an after-dinner pipe, they may live over their boyhood's past, and be more fit for the cares of the morrow, by having such remembrances to call back to the present.

AK-SAR-BEN.

Florida Fish and Fisheries.

A Plea for their Development and Protection.

BY DR. JAMES A. HENSHALL, U. S. FISH COMMISSION.

[Read before the Tampa Fisheries Congress.]

THE principal fishing industries of Florida are prosecuted on the Gulf coast, at Pensacola, Tampa, Punta Gorda and Key West, though the shad fisheries of the St. John's River are very important, and considerable business in this direction is also done at various places on the East Coast.

At Pensacola the principal fish product is the red snapper, a fish of good size and of firm flesh of fine quality, which bears transportation well. It is taken with hook and line on the snapper banks in from ten to fifty fathoms, and from ten to fifty miles off shore. At Cedar Key, Tampa and Punta Gorda the bay and brackish water fishes are taken by haul seines on the shores of the bays and inlets; the varieties mostly handled are mullet, red fish or bass (as it is known commercially), sea trout, pompano (the best of all fishes for the table), Spanish mackerel, jackfish, etc., while large quantities are cured by salt. At Key West many of the fishes are entirely different from those of the other waters of the State, and belong rather to the West Indian fauna. They comprise the coral fishes, the salt-water fishes par excellence. All are taken with hook and line, as the various seines and nets cannot be utilized owing to the ragged coral formation of the shores and reefs. The principal fish are kingfish, mackerel, groupers, snappers, grunts, jewfish, etc., which exist in great variety. The catch is almost entirely consumed at Key West. Formerly a fleet of smacks carried live fish in wells to Havana until a prohibitory import duty was imposed by the Captain General upon fishermen from the United States, which compelled the abandonment of the industry and the sale of the smacks to Spanish fishermen, who in addition to taking fish contrary to law in Florida waters carried on a nefarious trade in smuggling vile rum and poor cigars.

The Gulf coast line of Florida, Alabama, Mississippi, Louisiana and Texas is more than 6,000 miles in length, being about 1,000 miles longer than that of the Middle Atlantic States, which rank next in extent of coast line of the East United States. Of this extent Florida has nearly 3,000 miles, or one-half.

A statistical review of the United States Fish Commission, published some ten years ago, says: "The Gulf States occupy a favorable location for supplying a large part of the country with marine product. A dozen or more States in the lower Mississippi Valley have the nearest coastal connection through these States, and it will probably be in response to this section's demand for marine food product that the Gulf fisheries will reach their highest development."

The fulfillment of this prediction has been realized; for at present a large demand exists for the food fishes of Florida in all the South Atlantic States, while the choicer varieties, such as red snapper, pompano, Spanish mackerel, etc., are shipped to all the principal Northern cities. The same report says: "This region is favored with many highly esteemed food fishes, which occur in greater abundance than elsewhere on the coast of the United States. The undeveloped resources of the Gulf States invite outside attention and afford a promising outlook for future increase. The possibilities of the region in the matter of oyster production and cultivation are believed to be great."

Few sections of the United States are better supplied with desirable and important marine fishery products, including fish, reptiles and invertebrates, than the Gulf States. Among the invertebrates the oyster ranks first in commercial importance. It is extremely abundant throughout the entire section and constitutes the most prominent fishery product. No other mollusks have as yet attained economic prominence, though in Florida the round clam or quahog is taken in small quantities, and the meat of the conch is used for bait and eaten locally.

"A number of species and varieties of sponges occur off the Florida coast and are objects of an important fishery, the only one of the kind prosecuted in the United States."

Among crustaceans the shrimp is the most prominent. Crabs are abundant in this region. In addition to the common blue crab of the Atlantic coast, there occur the shore crab, the lady or sand crabs, and others of less importance. The stone crab, which reaches a large size and is very palatable, is probably most abundant on the coast of Florida.

The economic value of the reptiles inhabiting the Gulf States is greater than in any other section. Foremost among them is the alligator. There are at least five specimens of the terrapin in this section, which are valuable as food. Four of these occur in fresh water. The salt-water or diamond-back terrapin is also found in the salt marshes from Florida to Texas, and is a valuable article of fishery. The region is included within the range of three soft-shell tortoises. Two species of snapping turtles also inhabit the fresh waters of these States. Three important marine turtles frequent the Gulf of Mexico and are sought by the fishermen; these are the green turtle, the loggerhead and the hawksbill or tortoise-shell turtle.

From the foregoing brief account of the fishery resources and kindred industries of Florida it is evident that the present active demand for fish, oysters, etc., will be largely augmented in the future, especially in view of the fact that there is a material decrease in the supply of these products in Northern waters; indeed there are already many fishing smacks in Florida waters every winter, and lately there have been oyster grounds located and taken up by Northern parties with a view to an increased cultivation of oysters. The granting of these privileges should be paid for by the parties interested and made a permanent source of revenue to the State, the same as is done in the States of Virginia, Maryland, New Jersey, New York, etc. This is a very important matter and should be attended to before the best grounds are disposed of gratuitously. A State fish commission could be made self-supporting by the revenue derived from the rental of oyster grounds alone, and there should be therefore an intelligent supervision of this branch of the fisheries in order that those interested may keep pace with the improvements and discoveries that are yearly being made in the cultivation of oysters and be better enabled to foster this important industry.

The same necessity exists for an able and competent supervision of the sponge interest, in which Florida alone is concerned, for in the waters of that State are the only sponge beds in the United States. It is of vital importance then that those beds should be properly protected, the taking of the sponges subject to wise and judicial surveillance, and their cultivation prosecuted with vigor and intelligence in order that the supply may be maintained and increased, and the revenue to the State consequently enhanced.

The shad fishery of the St. John's River constitutes one of the most important branches of Florida fishing industries, and the first shad of the season are shipped thence to Northern markets at a time when they command the highest market price. As the supply has lately been seriously decreasing, it is of paramount importance that the yield should be increased by artificial cultivation. The artificial propagation of shad has been attended by more pronounced success perhaps than that of any other fish, a most convincing example being that inaugurated by the United States Fish Commission in California, where by the planting of less than a million shad fry in the bay of Sacramento a few years ago they have become so numerous that this fish is now sold for a less price than in Eastern markets. When it is considered that prior to this experiment there were no shad whatever on the Pacific coast the argument in favor of artificial culture of the shad is incontrovertible, and its success is at once assured.

The State of Florida could have at least one hatchery on the St. John's River, and as the shad hatching season lasts but a couple of months the expense is trifling, while the results are all important, far reaching and most bountiful.

There has also been a marked decrease in some of the coast fishes, while a complaint of the scarcity of the best food fishes in the inland waters of the State is universal. Now is the time to do something toward a restoration of the fish supply of these waters or at least to prevent a further depletion by the proper and fostering care of a competent Fish Commission—one that is able to cope with the situation and to apply a proper remedy, whether it be by artificial cultivation or by increased protection, and by so doing to increase the food supply of the people.

In the Northern States the fishes of many of the interior streams have either been totally destroyed or very materially decreased by the pollution of the streams through the refuse and offal from manufacturing establishments. It would be the part of wisdom for Florida authorities to be forehanded in this matter, on the principle that "an ounce of prevention is worth a pound of cure," and to enact such laws as will prevent a like decrease of the fish from similar causes. The United States Fish Commission has done considerable work in Florida and will do a great deal more; and it is also contemplated to establish a station for the cultivation of fish, oysters, sponges, etc., at no distant day. In view of such an event, therefore, it is all the more important that good protective laws and their effective enforcement by a competent State Fish Commission should be provided for, otherwise the work of the National Commission would be to a great extent rendered nugatory.

It will be readily seen from what has been said that it is of the utmost importance that the fisheries industries of the State should be looked after by an efficient and competent commission. It has been demonstrated in Northern States, and particularly in Florida, that the plan of a complimentary fish commission composed of several who receive no compensation has not worked advantageously, although liberal appropriations were annually made in the older States. Too often such commissions degenerate into mere political machines, for the securing of votes, for the legitimate work of the commission is neglected or frustrated. It cannot be expected that men will give much time and attention to duties for which they receive no compensation; so it follows as a matter of course that if they cannot command dollars they will command votes if possible.

The Fish Commission of Florida is virtually obsolete at present, for notwithstanding the appointment of three Commissioners several years ago, as provided by law, the Secretary of State has informed me that nothing has been done by them, and that to all intents and purposes the Commission has ceased to exist.

What is needed is the enactment of laws that provide

for the appointment of a single commissioner of fish and fisheries at a fair salary; one who has a scientific and practical knowledge of fish and fisheries, and is fully competent to deal with the subject in all its bearings. Such a person would be materially able to augment the revenue of the State by an increased development and a more abundant yield of the various fisheries. If thought best he might also have supervision of game birds and mammals, and see that the laws for their protection are enforced.

CHICAGO AND THE WEST.

Chicago Fly-Casting Club.

The Chicago Fly-Casting Club held its annual banquet Monday evening of this week, Feb. 14. A very pleasant time was enjoyed. The club will send representatives to the angling tournaments at Grand Rapids and San Francisco. The following officers were elected for the ensuing year: F. N. Peet, President; C. G. Ludlow, Vice-President; G. A. Murrell, Secretary-Treasurer; I. A. Bellows, Captain; B. W. Goodsell, Director for three years, and F. L. Crosby for one year.

Colorado Trout.

State Warden Swan, of Colorado, this week made a trip to Twin Lakes, near Leadville, to look into the recent monstrous slaughter of trout, occasioned by the damming of the outlet of the lakes by a reservoir company. The water in the outlet was drained, and the trout were left in heaps along what had once been a well-stocked stream. The State warden is disposed to prosecute the offenders to the limit of the law.

Iowa Fish.

State Warden George E. Delavan, of Iowa, in his annual report points out that the sentiment in favor of protecting fish is growing in Iowa. I can remember when Iowa only appropriated \$1,000 to the pay of the whole expenses of the Fish Commission for two years. Mr. Delavan's last appropriation was \$6,000 for two years. A bill has been introduced in the present session asking for \$21,000 for the next two years. This is more like it.

Anglers in Iowa have long had occasion to objugate the memory of the dam at Bonaparte on the Des Moines River. This dam was built by the State in 1850 and was sold to the parties who still own it. The latter agreed to keep it in repair for fifty years. They have kept it in good repair, so good that a fish cannot get over it, and no fishway has ever been put in. Thus the natural run of fish was cut off from thirty-one counties of this rich prairie State. The Iowa State Sportsmen's Association, with a petition of 15,000 names, asks the State Legislature to appropriate \$30,000 for the purpose of buying and blowing up the Bonaparte dam.

I notice the following interesting scores of large muscallonge, speared this week in Chautauqua Lake, N. Y.: Two of 30lbs., one of 36lbs., one of 31lbs., one of 37lbs., three of 18lbs. and one of 9lbs. and one of 11lbs. Muscallonge steaks retail there at 24 cents a pound, and the average gross price is 15 cents a pound.

I notice also the following matter-of-fact comment on the above takes, as mentioned by the Jamestown, N. Y., Journal:

"Nearly all of the large muscallonge which have been taken during the two days have been filled with eggs."

We hold up a good many people here in Chicago, and we gold-brick a man from New York every once in a while. But we don't spear spawn-bearing muscallonge in the spring.

Protection for the Rock River.

CHICAGO, Ill., Feb. 24.—The Winnebago County Fish and Gun Club has now been permanently organized for the purpose of protecting the Rock River, of Illinois, which has been the scene of many violations of the fish and game laws. The annual dues will be \$1. The officers are as below at this date:

President—A. E. Savage.

Vice-President—P. A. McPherson.

Secretary and Treasurer—Charles S. Baldwin.

Concessioners.

On Feb. 12 another conference was held in this city between the State Fish Commission and the larger fish dealers of Chicago. The practical result is immunity for the fish dealers except in flagrant cases of the violation of the law. The trouble seems to be that we have some deputy fish wardens in this city who are making things too beastly hot to please the big dealers. The latter claim that they cannot afford to lose a barrel of fish because some shipper has allowed a few short-sized fish to get into the lot. The Fish Commission has tried to meet the market fishermen half way, and the latter have promised to do as much. This is the American way of enforcing the law. When I used to live out in a cow camp, we never knew any law except the Sheriff, and he always told us to behave about the way he thought was right. I suppose this is the way with the Fish Commission.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Frozen Fish Thawed Out.

Editor Forest and Stream:

For many years I was employed in a factory situated within a stone's throw of a pond of several hundred acres, well stocked with perch, pickerel, bullheads and smaller fish. This pond furnished the water power for three mills, and was drawn down about 6ft. or more every summer. The highway, at a point near our factory, cut off a part of the pond. The two parts, however, were connected by a stone culvert, or "bridge hole." The bottom of the main pond was several feet lower than that of the Meadows, as we called the smaller part; the Meadows consequently were shallower, filled faster, and flowed into the main pond when it was half full or less.

Owing to a dry autumn the pond was very low, and the water from the bridge hole flowed over the stones in a wide, shallow stream about 20ft. before reaching

the pond below. It was about the third day of a very cold snap when, passing along the highway, my attention was attracted by the struggling of a fish on the stones below the bridge. On investigating I found a number of fish, some of them frozen on to the stones; in fact, some were completely encased in ice. I ran over to the factory for a water pail, and filled it with the fish. They were horn pouts and yellow perch. The temperature was close to the zero point, and they were soon all of a kind so far as freezing was concerned. In that state they were carried to my home, a mile distant, where a large sink was nearly filled with water, and the fish were placed therein. At that time they had been in my possession from an hour and a half to two hours.

Now I cannot say that all of the bullheads revived, but most of them certainly did, and were apparently as lively as ever. As to the yellow perch I am not sure, but my impression is that none of them recovered. It seems fairly evident that the question of recovery depends altogether upon the species of fish frozen. Horn pouts, eels and black bass, in a lesser degree, are tenacious of life, and survive treatment that would prove fatal to trout or smelts.

Some five or six years later fish appeared at the same place under precisely the same circumstances. This time the fish were about all yellow perch (not a pickerel, as far as I know); the run was larger, and more of them; not so numerous as the Kekoskee bullheads, of course, but several hundred, perhaps. Now, what was the cause? I have always supposed it to have been the lack of air under the ice, the meadow being shallow and no air-holes whatever open.

Has any one another theory?

HOCKLEY.

A Proposition for Great Britain.

I HAVE a letter from England which says: "Would Reuben Leonard come over?" Of course this means to cast the fly in public. "I think he could get enough to pay half his rail, sea and living expenses, out and home, if the other half can be subscribed on your side." My correspondent is a solid, reliable man; and if I was in a financial condition to say the word I would say: "Here, Reuben, is a check and an order for you to draw on me for any deficiency. You know that we sent Reuben Wood over there in 1883 and he astonished our relatives who live beyond that damp spot on the map which geographers have named the Atlantic. Now, Reuben, go and show them how a second Reuben and a Yankee arm can get out a Yankee line on a Yankee rod, whether the latter be a 100z. affair or only a toy of 40z."

That is what I would do if I could; and if possible, there would be a great big bonus for Reuben if he did what I know he can do.

My correspondent says: "Of course the recent competition in New York, in a building [italics are his], are not the same as out in the open air, where the wind and the weather have a good look in."

Let us to send Reuben Leonard to England; not as an athlete, to demonstrate physical superiority in an individual, but to show that American rods are the best that the world produces. Let those who believe this send in their subscriptions, and make it more than mere "expenses" for our champion. I will start the ball with a small one.

This challenge, if it is a challenge, is hurriedly gotten up. Without consultation with any person, it seems to me that if our English friends want to get Reub Leonard over there to cast, in order to prove that American rods are the best, they should offer direct inducements for him to cross the water and cast in their contests. It is nothing to me, nor to thousands of others, that Reub Leonard has beaten the world's record in fly-casting. It is much to the firm that Reuben works for, and after considering the subject in that light I think that they, and not we, should send Reuben over the pond to a fly-casting contest.

BENCH SHOWS.

March 8.—Northwestern Kennel Club's dog show, St. Paul, Minn. C. E. N. Howard, Sec'y, St. Paul, Minn.
March 15.—Kansas City Kennel Club's second annual show, Kansas City, Mo. A. E. Ashbrook, Sec'y.

The New York Show.

THE twenty-second annual show of the Westminster Kennel Club, held in Madison Square Garden on the four days beginning Feb. 21, was one of the greatest ever given by the club, and in some respects the greatest, as in the number of entries, which numbered 1,703—a record breaker for America. The total number of dogs was 1,330. It was also great in the high quality of the dogs as a whole, and the special excellence of some of the classes. It was a model in the matter of superintendence, neat, attractive, and well managed. The benching and feeding were done by Spratts Patent in their usual satisfactory and thorough manner. The eminent veterinarian, Dr. H. Clay Glover, was alert in his duties as veterinary officer of the club.

The judges were Miss A. H. Whitney, Lancaster, Mass., St. Bernards, Newfoundlands and pugs; J. Blackburn Miller, New York, Great Danes; Dr. A. H. Heffinger, Portsmouth, N. H., American foxhounds; Charles Heath, Newark, pointers; William Tallman, Greensboro, N. C., English setters; George Jarvis, New York, Irish and Gordon setters; Andrew Laidlaw, Galt, Ont., sporting spaniels; Robert McEwen, Byron, Ont., collies; Charles D. Bernheimer, New York, poodles; J. H. Matthews, New York, bulldogs; J. F. Holt, Boston terriers; H. F. Schellhass, beagles; George Raper, Wincobank, Yorkshire, Eng., all other classes. Their work as a whole was well received.

While the show was well supported in respect to public patronage, there was a noticeable absence of the crowds

which were in attendance at some former shows. In respect to them, so dense was the Garden packed at certain hours of the afternoon and evening that it was difficult to pass through the throngs of visitors. The aisles were so crowded that it was perforce necessary to move with the crowd as a part of it. While the last show was well attended by the public, there was a distinct falling off in numbers as compared to previous years. This might have had no effect on the actual receipts, as there were rumors in wise quarters that there were very few complimentary tickets out, whereas in former years there was an extremely large number of free admissions, quite enough to explain the difference of the attendance this year as compared with the larger ones of previous years. In fact, so close was the management in the matter of complimentary tickets that it evoked much discontent among the exhibitors. They do not look upon their support of a dog show as being wholly a business venture. Each exhibitor considers that his exhibits are a component part of the show, and that there is a reciprocal fellowship and common purpose between the exhibitors and the club members. The granting of a complimentary ticket or two to an exhibitor has been so sanctioned by general usage that it has almost come to be considered a right, so that the sudden transition from the generous giving of complimentary tickets to the giving of a very few was far from meeting the approval of many of those who helped to make the show. Still, there is on the other hand the financial responsibility of the club for the many thousands of dollars expended in conducting the show, and the matter of revenue and expense may have had a direct bearing on the readjustment in respect to the giving of complimentary tickets.

There were quite a number of imported dogs which made their American debut at this show. Of these, Black Peter was quite notable for his excellence. Mastiffs as a rule are devoid of symmetry, but Peter has it to perfection. He is very sound physically. Then there were the bulldog Rensal's Dandy Ven, and the bull terrier Woodcote Wonder; the Irish terrier Leed's Muddler; the collies Border Lad, Old Hall Admiral, Heather Mint and Heather Moll, imported by the Verona Kennels, of San Francisco.

Foxhounds were ten in number, a light entry. As to quality, they rated low. English foxhounds numbered two, one in the free-for-all class for dogs, one in that for bitches. The American division were a bad lot. Legal, first in free-for-all dogs, is a coarse hound; Duke, second, is leggy and but little better than an average hound; Jim Corbett, third, and the reserve and vhc. dogs were very ordinary. There were two bitches in their free-for-all class. Veracity, first, shows some characteristics of the English hound.

Pointers were in good numbers, eighty-one entries, this number including re-entries. There were a few dogs of excellent quality, after which the commonplace prevailed. The Westminster Kennel Club had a kennel of four for exhibition only. In the puppy class for dogs and bitches Island Boy, a good puppy, took first. He is smoothly turned, well ribbed, symmetrical, and stands on good legs and feet. He carries his ears high, which mars an otherwise good expression. Second went to Geisha Girl, plain in head, still a very good puppy. King Chimes, third, is a long cast, large puppy, fairly good in quality. Fairview Graph, first in novice dogs, is well built, symmetrical, a good all-round dog. Ridgeview Lad, second, is narrow in muzzle and heavy in skull. Island Boy took third. A well-ribbed, good-bodied bitch, Ridgeview Blithesome, took first in novice bitches, second going to Highland View Revel, third going to Daisy Belle, plain in head, good otherwise. Light-weight junior dogs was won by Fairview Graph, second going to Furlough Bang, a low-set dog, a trifle out at elbows and flat in skull. Ridgeview Prince, narrow in muzzle, the reserve in the novice class, took third in this class. Heavy weight junior dogs brought out quite a strong competition. Dustaway is a large pointer, of excellent muscular development and symmetry, soundly built, stands on good legs and feet, and is as active as a light-weight. He is upstanding and gamy in appearance. Second went to Prince's Lad, an upstanding, well-built dog, lacking in smoothness of finish. Ridgeview Lad was third. Free-for-all dogs was won by Lad of Kent, second going to Sir Walter, third to Ridgeview Comet, all old competitors and well known. The strongest rivalry was between first and second. Lad also captured the honors in the winners' class. Fay Templeton, a cobby bitch, was first in light-weight junior bitches. Ridgeview Blithesome and Revel were second and third respectively. Jane Faulkner, reserve, was very poor in head. Furlough Bloom, in good condition, was first in junior heavy-weight bitches. She is a well-known competitor. Ridgeview Blooms was second. Daisy Belle third; the two latter were in the novice bitch class, wherein Belle was third and Blooms reserve, the judge thus reversing them. Fay Templeton won in free-for-all bitches, Kent's Kate, a good all-round bitch, scoring second, and Urada third. The latter two are well-known winners. Fay Templeton also won in the winners' class. George Gould's exhibit took the kennel prize.

English setters rated low in quality, although there were a few good individual dogs to relieve the mediocre showing. In puppies the competition was weak, as it also was in the novice class. In junior dogs, Gilhooly first, Orangeman second, Baron M., light in muzzle and a little slack in build, took third. In free-for-all dogs, Cincinnatus Pride, a dog of rare symmetry, took first easily, over Gilhooly and Orangeman, first and second respectively. Junior bitches was won by Blanche G., a fairly good all-round bitch, second going to Laundress, light in muzzle; third going to Lady Victress Llewellyn, plain in head, but good otherwise. Free-for-all bitches numbered four, first going to Ruby D. III., a lanky bitch, plain in head; second going to Minnie K., light in bone; third to Lady Victress Llewellyn. Cincinnatus Pride took first in the field trial class, over Montell, and the Eldred Kennel took the kennel prize.

Irish setters were poor in quality. Miss Rockwood had a walkover in puppies. The novice class first was won by Tuppeny, a snipy-nosed dog, light in color, and a dog of average quality only. Second went to a long-cast dog, Rockwood Dash, third going to Hunter, coarse

in head and flat in ribs. Junior dogs was won by Londonderry, light in muzzle, and he might be better ribbed. Second went to Hunter, third to Shamrock O'More, a good, large dog, good in color, first at New York in two previous years. He was much the best dog in this class, which was not of a noticeably high character as to its entries. Free-for-all dogs was won by the well-known Kildare, looking in good condition, while Hunter and Shamrock took second and third respectively. Kildare also won in the winners' class. Junior bitches was won by Meg Merrilles II., plain in head, thin, weak feet, light in loin. Red Belle, second, was better in every respect than the winner. She is a fairly good all-round bitch. First went to Time, heavy in shoulders. In free-for-all bitches, the well-known Queen Vic took first honors. She was in good condition and carries her years well. Duchess and Ruby Glenmore II., both well known, won first and second in the order named. Queen also won in the winners' class. The field trial class had three entries, first going to Lady Alice. Joe Lewis' kennel won the kennel prize.

Gordon setters had a light entry. The two puppies, Lady Clinton and Lassie, first and second, were commonplace. There were four entries in the novice class, of which Echo Clinton, having a coarse head and flat ribs, took first; Lassie, beefy in appearance, took second, and Black Chief, cowhocked, coarse in head and light in body, took third. Doc was first in junior dogs; Beaumont, Jr., second; third going to Don B., light in bone, good color. Free-for-all honors were taken by Doc, second by Heather Bruce, third by Heather York, all well-known winners. Doc also won in the winners' class. Lassie was first in junior bitches, second going to Sallie Beaumont, third to Pinemont, all winners in previous competitions. Free-for-all bitches were, first, Heather Bee, second Lassie, third Flomont, all being previous winners; the first mentioned taking first in the winners' class. Flomont and Sallie Beaumont were first and second respectively in the field trial class.

Beagles were an excellent exhibit, both in the number of the competitors and their quality. The kennel prize was taken by the Hempstead Beagles, and their Parson took the Pickhardt cup. The juvenile challenge plate was won by their Primate. A. J. Purrinton's Millard R. took the medal for the best beagle placed in any field trial.

FOXHOUNDS.—Free for all—English—Dogs: 1st, A. B. McGregor's Songster; 2d, L. H. Parson's Song. American—Dogs: 1st, J. Gibbs' Legal; 2d, A. B. McGregor's Duke; 3d, Dr. C. A. Foster's Jim Corbett; res., J. H. Van Dorn's Rice. Bitches: 1st, J. Gibbs' Veracity; 2d, A. B. McGregor's Gipsy.

POINTERS.—Puppies: 1st and 3d, W. G. Brokaw's Island Boy, and King Chimes; 2d, A. M. Hopper's Geisha Girl. Novice—Dogs: 1st, C. P. Wilcox's Fairview Graph; 2d, Highland View Kennels' Ridgeview Lad; 3d, W. G. Brokaw's Island Boy. Bitches: 1st and 2d, Highland View Kennels' Ridgeview Blithesome and Highland View Revel; 3d, F. A. Hodgman's Daisy Belle. Light-weight, junior—Dogs: 1st, C. P. Wilcox's Fairview Graph; 2d, George J. Gould's Furlough Bang; 3d, Highland View Kennels' Ridgeview Prince. Heavy-weight—1st, Frank Clark's Dustaway; 2d, George S. Mott's Prince's Lad; 3d, Highland View Kennels' Ridgeview Lad. Free-for-all—1st, George Jarvis' Lad of Kent; 2d, W. G. Brokaw's Sir Walter; 3d, George J. Gould's Ridgeview Comet; res., Geo. W. Lovell's Shotaway. Light-weight, junior—Bitches: 1st, R. A. Fairbairn's Fay Templeton; 2d and 3d, Highland View Kennels' Ridgeview Blithesome and Highland View Revel; res., J. H. Bradley's Jane Faulkner. Heavy-weight, junior—1st, George J. Gould's Furlough Bloom; 2d, Highland View Kennels' Ridgeview Bloom; 3d, F. A. Hodgman's Daisy Belle; res., George Ferguson's Beggie. Free-for-all—1st, R. A. Fairbairn's Fay Templeton; 2d and 3d, F. J. Lenoir's Kent's Kate and Urada. Winners—Best dog, Lad of Kent; best bitch, Fay Templeton.

ENGLISH SETTERS.—Puppies: 1st, G. S. Raynor's Chief Rival; 2d, J. M. King's Rod Star; 3d, H. G. Ogden's Empress; res., J. M. King's Ornament. Novice—1st, T. Watt's Highland Fleet; 2d, Royal Blue Kennels' Comtesse Bijou; 3d, Kalmia Kennels' Maud III.; res., H. D. Ogden's Neil of Burnett. Junior—Dogs: 1st, C. J. Gaylor's Gilhooly; 2d, John Brett's Orangeman; 3d, Meadow City Kennels' Baron M.; res., James M. Bullock's Frank S. Free-for-all—1st, E. A. Burdette's Cincinnatus Pride; 2d, C. J. Gaylor's Gilhooly; 3d, John Brett's Orangeman; res., S. W. Carey, Jr.'s Albert's Ranger. Junior—Bitches: 1st, Meadow City Kennels' Blanch G.; 2d, Eldred Kennels' Landress; 3d, W. J. Davis' Lady Victress Llewellyn; res., Royal Blue Kennels' Comtesse Bijou. Free-for-all—1st, James E. Borden's Ruby D. III.; 2d, Dr. E. H. Kessler's Minnie K.; 3d, W. J. Davis' Lady Victress Llewellyn; res., Kalmia Kennels' Maud III. Field Trial—1st, E. A. Burdette's Cincinnatus Pride. Winners—Best dog, Cincinnatus Pride; best bitch, Ruby D. III.

IRISH SETTERS.—Puppies: 1st, James M. Bullock's Miss Rockwood. Novice—1st, Jas. M. Claxton's Tuppenny; 2d, James M. Bullock's Rockwood Dash; 3d, P. F. O'Neil's Hunter; res., E. R. Ladew's Massasoit. Junior—Dogs: 1st, Jas. B. Blossom's Londonderry; 2d, P. F. O'Neil's Hunter; 3d, G. Shippen's Shamrock O'More. Free-for-all—1st, Joe Lewis' Kildare; 2d, P. F. O'Neil's Hunter; 3d, G. Shippen's Shamrock O'More. Bitches: 1st, J. M. Bullock's Meg Merrilles II.; 2d, Joe Lewis' Red Bell; 3d, Dwight E. Bowers' Trine; res., Jas. B. Blossom's Rosamond. Free-for-all—1st and 2d, Joe Lewis' Queen Vic and Duchess; 3d, E. W. Tynan's Ruby Glenmore II. Field Trial—1st and 3d, Jas. B. Blossom's Lady Alice and Bedford; 2d, W. L. Washington's Finglas. Winners—Best dog, Kildare; best bitch, Queen Vic.

GORDON SETTERS.—Puppies: 1st, Kugler & Cook's Lady Clinton; 2d, L. Prasse's Lassie. Novice—1st, W. G. Kugler's Echo Clinton; 2d, C. E. Squire's Lassie; 3d, H. A. Smith's Black Chief; res., H. Blake's Prince. Junior—Dogs: 1st and 2d, J. B. Blossom's Doc and Beaumont, Jr.; 3d, Thomas M. Gollin's Don B.; res., H. Blake's Prince. Free-for-all—1st, 2d and 3d, J. B. Blossom's Doc, Heather Bruce and Heather York; res., Dr. F. S. Nostrand's Rex. Junior—Bitches: 1st, C. E. Squire's Lassie; 2d and res., J. B. Blossom's Sallie Beaumont and Venus; 3d, C. J. Reynolds' Pinemont. Free-for-all—1st, 3d and res., J. B. Blossom's Heather Bee, Flomont and Sallie Beaumont; 2d, C. E. Squire's Lassie. Field Trial—1st and 2d, J. B. Blossom's Flomont and Sallie Beaumont. Winners: Best dog, Doc; best bitch, Heather Bee.

IRISH WATER SPANIELS.—Junior—1st, F. A. Carson's Mollie C.; 2d, Samuel W. Orr's Blarney. Free-for-all—1st, T. A. Carson's Dan Maloney; 2d, Miss A. Green's Dennis.

FIELD SPANIELS.—Puppies: 1st and 2d, M. A. Viti's Royd Monarch II. and Trouble. Novice—1st and 2d, R. P. Keasbey's Saybrook Popcorn and Saybrook Boss; 3d, George R. Preston Jr.'s, Donnie; res., Miss A. Green's Topsy. Black—Junior—Dogs: 1st and 2d, Miss A. Green's Wardleworth Sweep and Dark Despair; 3d and res., R. P. Keasbey's Black Night and Saybrook Boss. Any other color—1st, R. P. Keasbey's Saybrook Popcorn; 2d and 3d, C. T. Mead's Napoleon and Woolton Wonder. Free-for-all—1st and res., C. T. Mead's Woolton Baron and Woolton Wonder; 2d, M. A. Viti's Royd Monarch; 3d, Dr. S. J. Bradbury's Drayton Warwick. Black—Junior—Bitches: 1st, R. P. Keasbey's Saybrook Minnie; 2d, George R. Preston, Jr.'s, Princess Alice; 3d, Miss Anabel Green's Honey. Any other color—1st, C. T. Mead's Walton Dagmar; 2d, R. P. Keasbey's Saybrook Cypress. Free-for-all—1st, C. T. Mead's Walton Dagmar; 2d, G. R. Preston, Jr.'s, Princess Alice; 3d, R. P. Keasbey's Saybrook Cypress; res., M. A. Viti's Scandal. Winners—Best dog, Woolton Baron; best bitch, Walton Dagmar.

COCKER SPANIELS.—Puppies: 1st, Mepal Kennels' Mepal's Cleo; 2d, F. E. Adler's Elm City Doc; 3d, George Douglass' Axtel; res., Montrose Kennels' Montrose Surprise. Novice—1st, Belle Isle Kennels' Princess Flavia; 2d, Mepal Kennels' Mepal's Cleo; 3d, F. E. Adler's Elm City Beauty; res., W. Douglass' Queen of Spades. Black—Junior—Dogs: 1st, George Douglass' Ono; 2d, Belle Isle Kennels' Ono; 3d, F. W. Fiske's Chief; res., George Douglass' Axtell. Red or Liver—1st and 3d, George Douglass' Red Mack and Harvey; 2d, H. G. Charles-

worth's Nugget; res., Terra Cotta Kennels' Red Coat. Any other color—1st, Swiss Mountain Kennels' Cupid S.; 2d and res., W. F. Payne's Pebbledash and Kite; 3d, H. J. Lord's Puck. Free-for-all—Black—Dogs: 1st, George Douglass' Premier; 2d, Belle Isle Kennels' Ono. Junior—Black—Bitches: 1st and 2d, Mepal Kennels' Little Egypt and Mepal's Opal; 3d, Belle Isle Kennels' Princess Flavia; res., Swiss Mountain Kennels' Village Belle. Red or Liver—1st, Swiss Mountain Kennels' Banner Mattie; 2d, Montrose Kennels' Rosamond; 3d, George Douglass' Silver Queen; res., Terra Cotta Kennels' Amusement II. Any other color—1st, Swiss Mountain Kennels' Banner Rita; 2d, W. T. Payne's Kingston's Tansy; 3d, Hornell-Harmony Kennels' Hornell Jeane; res., Dr. S. J. Bradbury's Lynbrook Bridal. Free-for-all—Black—1st and 2d, Mepal Kennels' Little Egypt and Mepal's Opal; 3d, Belle Isle Kennels' Princess Flavia; res., H. G. Charlesworth's Simcoe Rose. Any other color—1st, W. T. Payne's Blue Bells II.; 2d, Terra Cotta Kennels' Amusement II.; 3d, Miss Ada Caldwell's Toby Adams. Winners—Best dog, Premier; best bitch, Blue Bells II.

BEAGLES.—Puppies: 1st, Hempstead Beagles' Primate; 2d, W. Saxby's Turpin; 3d, Waldingfield Beagles' Medley. Novice—1st, Hempstead Beagles' Parson; 2d, A. J. Purrinton's Millard R.; 3d, Waldingfield Beagles' Orator; res., H. Fitzsimmon's Yankee Ben. Junior—Not exceeding 15in.—Dogs: 1st and 3d, Hempstead Kennels' Laughter and Hector; 2d, Waldingfield Beagles' Orator. 13 to 15in.—Dogs: 1st and 2d, Hempstead Beagles' Parson and Nimrod; 3d, A. J. Purrinton's Millard R.; res., Windholme Beagle Kennels' Robino II. Free-for-all—1st, Hempstead Beagles' Florist; 2d, Windholme Beagle Kennels' Robino II.; res., Waldingfield Beagles' Orator. Not over 13in.—Junior—Bitches: 1st, Hempstead Beagles' Tragedy; 2d, Waldingfield Beagles' Marjory; 3d, F. E. Thurston's Fan R. 13 to 15in.—Bitches 1st and 2d, Hempstead Beagles' Oransy Matron and Welcome; 3d, Waldingfield Beagles' Medley; res., George F. Reed's Reed's Flirt. Free-for-all—1st, Hempstead Beagles' Oransy Matron; 2d, Franklin Field Trial Beagle Kennels' Belle Summers; 3d, Windholme Beagle Kennels' Totteridge Lovely. Field Trial—1st, A. J. Purrinton's Millard R.; 2d, George F. Reed's Scorch R.; 3d, Hempstead Beagles' Leader; res., W. Saxby's Doubtful. Winners—Best dog, Parson; best bitch, Oransy Matron.

Club Meetings.

American Kennel Club.

THE annual meeting of the American Kennel Club was held in Madison Square Garden on Feb. 23. The president and vice-president were absent. Mr. A. P. Vredenburg, the secretary, was called to the chair. There were present: Associate members, G. W. H. Ritchie, A. C. Wilmerding, H. K. Bloodgood; Baltimore Kennel Association, W. P. Riggs; Butterfly Bench Show Association, D. E. Waters; Collie Club, James Watson; Columbus Fanciers' Club, J. M. Taylor; French Bulldog Club, W. W. Watrous; Gordon Setter Club, James B. Blossom; Mascoutah Kennel Club, C. F. R. Drake; National Beagle Club, H. F. Schellhass; Pacific Fox Terrier Club, B. Waters; Pointer Club, G. Jarvis; San Francisco Kennel Club, C. B. Knocker; American Dachshund Club, Dr. C. Motschenbacher; Milwaukee Poultry and Pet Stock Association, J. Mortimer; Philadelphia Kennel Club, F. G. Taylor; Metropolitan Kennel Club, G. M. Carnochan; St. Louis Kennel Club, C. A. Pratt. The credentials of G. Muss-Arnolt, delegate of the Great Dane Club, and J. H. Van Dorn, delegate of the Brunswick Fur Club, were accepted.

Credentials from the Pug Club and the Central Beagle Club were received too late to be acted upon at this meeting. The quarterly report of the secretary was read and approved.

The treasurer's report showed a balance of \$4,994 on hand.

The report of the stud book committee contained nothing of importance beyond the mention that the stud book will probably be ready for distribution next month. The committee recommended that the championship medals be confined to such breeds as are entitled to registration. The report was accepted.

The old board of officers was re-elected as follows: President, August Belmont; Vice-President, Edward Brooks.

Stud Book Committee—James Watson, Chairman; H. F. Schellhass, C. B. Knocker.

Field Trial and Coursing Committee—H. F. Schellhass, Chairman; Horatio Nelson, H. S. Joslin, Arthur B. Sharp, J. H. Van Dorn.

Constitution and Rules Committee—H. K. Bloodgood, Chairman; James Watson, H. F. Schellhass, G. W. H. Ritchie.

Finance Committee—A. Clinton Wilmerding, Chairman; James B. Blossom, Leslie A. Burritt.

Membership Committee—G. M. Carnochan, Chairman; C. D. Bernheimer, A. P. Vredenburg.

After a lengthy debate the changes in the new classification, as announced in the Gazette, were adopted by a decided majority. The classification is now as follows:

1. The puppy class shall be for all dogs over six months and under twelve months of age. No entry can be made or accepted of one under six months of age, or whose date of birth is unknown.

2. The novice class shall be for all dogs never having won a first prize at any recognized show, wins in the puppy classes excepted.

3. The limit class shall be for all dogs never having won four first prizes at any recognized show, wins in the puppy and novice classes excepted.

4. The open class shall be for all dogs of any age over six months.

5. The winners' class shall be open only to the winners of first prizes at any show, giving at least three of the before mentioned classes, one of which must be the open class, and the winner of three first prizes in this class will thereby become a champion of record, be so registered by the American Kennel Club, and will be entitled to an American Kennel Club champion medal. Before awarding "reserve" in this class, the dog or dogs having been placed second to the winner in any of the regular classes must be brought before the judge for competition with the remaining dogs in said winners' class. No class winner can be withdrawn from competition in the winners' class, and no entry fee shall be charged for said competition in said class. A dog that has already won one or more first prizes in the late challenge classes shall retain these wins to its credit, toward becoming a champion of record, the remaining qualifying wins to be gained in the winners' class. The winners' class can be divided by sex, provided the required three classes are also divided by sex.

The above classification to go into effect at once.

On motion it was carried that the new rules shall not

go into effect in respect to clubs whose prize lists have been published prior to March 1, 1898.

The senior class has been cut out, and what was the free-for-all is now the open class. The recommendation of the committee to strike out Article XIII. Constitution, was adopted. The proposition to change the name American Kennel Club to The Association of American Kennel Clubs could not be acted upon at the meeting. The name, being a part of the constitution, would need to be acted upon as in any other changes in the constitution, formal notice of such being required. It was pointed out that the new name gave a truer idea of the club's manner of organization, and thereby would tend to dispel any idea that the club was a clique or an independent aggregation of individuals. The amendments concerning the preservation of old championships in new competition was lost.

It was carried that an annual convention of the Pacific coast clubs shall be held in February, and they shall elect four delegates of bench show clubs and three of specialty clubs as members of the advisory board.

The Cedar Rapids Kennel Club was admitted to membership. The resignations of the Rhode Island Poultry Association and the Erie County Society for the Prevention of Cruelty to Animals were accepted.

The action of the executive board in the matter of the suspension of Messrs. Toon and Thomas was confirmed. The following cases were referred to the board: T. A. Howard versus Al G. Eberhart. A. E. Smyth versus F. Kirby. J. Tilburn versus J. Whelan. J. H. Parrott versus E. H. Moore. In the matter of the suspension of Dr. F. A. Davis, the action of the New England Kennel Club was indorsed. The matter of the suspension of J. Simpson for striking the judge in the ring at the late Boston show was referred to the board. The action of the N. E. K. Club in disqualifying the dog Dr. Jim, which was being shown by Simpson at the time, was not sustained. Mr. Wade Collins, pending the action of the Pacific Advisory Board, was suspended. The Central Beagle Club's application for permission to so amend its constitution that it can hold shows was referred to the board. The appeal of the Hempstead Farm Beagles from the decision of the N. E. K. C. was referred to the board.

Dr. Huidekoper, as representing the committee, submitted the report on their investigation in the matter of rabies. The replies to the committee's inquiries covered a large area, and were quite voluminous. The country was divided up into sections and apportioned off to different members to facilitate investigation. A table was added summarizing the results from the different States, also a map with the infected areas marked on it in red ink. He reported that the disease was unknown north of Massachusetts, though there is a small area in eastern Massachusetts where occasional outbreaks appear. In Connecticut there are only isolated cases. Of the Middle States, Pennsylvania has an infected district extending some fifty miles south of Philadelphia, and which originated in the suburbs of Philadelphia in 1870. The remainder of the State, and Delaware, Maryland, District of Columbia and Virginia, were free from the disease. There was but little proof of the existence of rabies in the Southern States which bordered the eastern bank of the Mississippi River. Less than 100 cases were reported in Wisconsin, Iowa, Minnesota, Nebraska, Colorado, Oklahoma and Kansas. The disease is unknown west of the Rocky Mountains. The daily press received a most scathing rebuke for the sensational and untruthful manner in which it treats the matter of rabies.

About eighteen clubs were in arrears for dues. They were given thirty days in which to properly respond, failing which they will be dropped from the roll.

In response to an inquiry the secretary informed the meeting that the cost of the championship medal was just about \$3.

It was carried that the club shall pay the mileage expenses of the executive board for the ensuing year.

Eastern Field Trials Club.

A MEETING of the Eastern Field Trials Club was held in Madison Square Garden Feb. 22. Ten members were present.

Officers were elected as follows: President, Pierre Lorillard, Jr.; Vice-President, C. H. Phelps, Jr.; Secretary and Treasurer, S. C. Bradley. The next trials will be held at Newton, Nov. 11. The following stakes will be run: Members' stake, Derby, all-age and subscription stakes; the same purses will be offered and the same rules will govern as last year, except in the members' stake; dogs competing in this stake must be the bona fide property of the member or members who enter them. Dogs having been placed in public field trials are barred from running in this stake. Dogs must be handled by owner. Special prizes offered for members' stake by Messrs. Hodgeman, Baker and Brown.

The purses offered are: \$600 for Derby; \$600 for all-age, and \$500 for subscription stake.

The Derby entries close June 1. All-age and subscription close Oct. 1.

Messrs. S. C. Bradley, Edmund Osthaus and Arthur Merriman were selected to act as judges.

The club grounds at Newton, N. C., now consist of nearly seven thousand acres.

The treasurer's report was read and accepted. It showed a good balance on hand.

Manitoba Field Trials Club.

THE eleventh annual meeting of the Manitoba Field Trials Club was held at the Manitoba Hotel, Winnipeg, at 8 o'clock P. M., Feb. 9.

Present: G. B. Borradaile, G. Soames, F. G. Simpson, John Wootton, W. F. Ellis and W. C. Lee. Proxies, G. A. Gouin, Thomas Cowan and W. E. Macara, represented by G. B. Borradaile; F. W. Jones and Thomas McCaffry were represented by F. G. Simpson. President Simpson was in the chair.

The audited report of the honorary secretary-treasurer, G. B. Borradaile, showed that after the club had paid all their prizes and expenses in connection with their 1897 trials, a substantial credit balance remained.

The secretary-treasurer's report as read was adopted, and the club tendered him their thanks for the able manner in which he had conducted their affairs.

On being nominated for president Mr. Simpson expressed thanks for the honor the club wished again to confer upon him. He pointed out that for the last five years he had been the club's president, and during that period his business had not always permitted his attendance at their trials. He considered it the duty of officers to be present on such occasions. He further pointed out that in his opinion the best interests of the club were not served by electing the same officers year after year; under the circumstances he could not allow himself to be nominated.

The club tendered their thanks to the retiring president for the untiring efforts he has always used to make their trials a success.

Officers were elected as follows: President, John Wootton, of Manitou; First Vice-President, Thomas McCaffry, Winnipeg; Second Vice-President, N. G. Leslie.

Mr. Borradaile informed the meeting, on being nominated for secretary-treasurer, that business obligations demanded his undivided attention, especially at the time of the club's trials. For this reason it was impossible for him to accept any office.

The club tendered its retiring secretary-treasurer a hearty vote of thanks for the manner he had filled the office.

Mr. W. C. Lee was elected Honorary Secretary-Treasurer.

Managing Committee—W. F. Ellis, W. E. Macara and Thomas Cowan.

Auditors, G. B. Borradaile and D. M. Telford.

The club will hold its twelfth annual field trials at Morris on Sept. 8 next.

The Management Committee was authorized to select a judge or judges for the club's 1898 trials.

The club's 1898 events will consist of an amateur, Derby and all-age stakes. The following prizes will be given and competed for under the following conditions: Amateur stake: Dogs eligible must be the property of an amateur residing in Canada. The following are barred: Dogs having won first place at any recognized field trials in any previous year, or whose owner may have trained for money. All dogs to be handled by owner or other amateur. Entries close Aug. 1, 1898. Prize, silver sup, suitably engraved; \$2 forfeit, \$3 to start.

Derby stake is for setters and pointers whelped on or after Jan. 1, 1897. Entries close July 1. Purse \$225; first, \$100; second, \$75; third, \$50. Forfeit, \$5. Starters, \$10.

The all-age stake is for setters and pointers who have not won first place at any recognized field trials in any previous year. Entries close Aug. 1. Purse, \$225; first, \$100; second, \$75; third, \$50. Forfeits, \$5. Starters, \$10.

A vote of thanks was extended to the club's patron, his Honor Charles Patterson, Lieutenant-Governor of Manitoba, for his kindness in judging the club's trials, and to F. Sprado.

National Field Trial Club.

At a meeting held in Madison Square Garden, at 4 P. M., Feb. 22, the National Field Trial Club was organized to run a national produce stake, with charter members as follows: Messrs. E. H. Osthaus, N. T. Harris, George Crocker, F. W. Dunham, J. B. Becker, F. R. Hitchcock, S. C. Bradley, Theo. Sturges, W. B. Meares, G. G. Williamson, Hobart Ames, J. E. Gill, W. Allen Peirce (Boston), C. H. Phelps, Jr., Dr. J. S. Brown. Messrs. Hitchcock, Sturges, Bradley, Meares, Becker, Brown and Phelps were present. The officers elected were: President, George Crocker; Vice-Presidents, Edward Dexter and Norvin T. Harris; Secretary-Treasurer, C. H. Phelps, Jr.

It is expected that the membership will be increased to twenty-five when all the parties who have been invited to join have been heard from.

The National Field Trial Club's produce stake will be run in the South on quail in Dec., 1899, or Jan. or Feb., 1900, and succeeding years. It is open to the produce of all setter and pointer bitches whelped on or after Jan. 1, 1898. Bitches to be nominated by June 1, 1898. Fee \$10. Entries of puppies to close Jan. 1, 1899, with \$5 fee. Second forfeit \$5, payable Oct. 1, 1899, and \$10 additional to start. The stake will be for a guaranteed purse of \$1,250 cash, of which \$500 to winner of first place, \$300 to winner of second place, \$200 to winner of third place, \$125 to breeder of winner of first, and \$75 to breeder of second, and \$50 to breeder of third. The nomination of the bitch may be made by anybody, and any number of puppies of a litter may be entered. Should less than fifty bitches be nominated, the right is reserved to abandon the stake for 1900. Efficient judges and suitable grounds will be selected.

It is intended to run the stake each year, commencing in 1900; but for stakes after 1900 nomination of bitches will close on a date to be later recided.

The Pointer Club of America.

The annual meeting of the Pointer Club of America was held Monday evening, Feb. 21, in Madison Square Garden Café. The president and vice-president being absent, Mr. F. J. Lenoir was elected temporary chairman. The report of the treasurer was accepted. Both the treasurer's and secretary's reports showed the club to be in a very flourishing condition.

The Northwestern Kennel Club, of St. Paul, Minn., was donated \$10 for special prizes, divided as follows: \$5 each for the best pointer dog and best pointer bitch, to be competed for by members of the Pointer Club at their show to be held March 8-11.

The replies received from members as requested by the secretary, relative to the suggested breeders' trophy, were read, and it was resolved that the matter shall be dropped. This decision was further arrived at as the W. Gould Brokaw four challenge cups have filled the present requirements.

It was also resolved that the holders of the four W.

Gould Brokaw cups, competed for at the Westminster Kennel Club's bench show, shall furnish with the secretary a bond of \$200 to insure their return until won outright, and that the secretary shall be the custodian of the cups until this requirement be fulfilled. The cups to be returned to the secretary thirty days previous to the opening day of the Westminster Kennel Club's bench show each year; said bond to be filed with the secretary, and to be acceptable to the board of governors.

Resolved, That the Pointer Club of America shall offer a breeders' trophy, to be competed for at the Westminster Kennel Club's bench show. The competition governing said trophy to be arranged by the board of governors.

Resolved, That the award made to the pointer dog Shotaway at the Metropolitan Kennel Club show at Brooklyn, and which reverted to the Pointer Club by disqualification, on the grounds that his owner was not a member of the Pointer Club of America, shall be paid to the owner of the pointer dog Prince's Lad, Mr. Geo. S. Mott.

Mr. F. R. Vernon, of Brooklyn, N. Y., was elected to membership. The names of four other gentlemen were offered for membership.

The election of officers for the ensuing year resulted unanimously as follows: President, W. Gould Brokaw; Vice-President, James Mortimer; Secretary, William H. Brush; Treasurer, C. F. Lewis; Board of Governors, J. D. James, George Jarvis, Thomas Blyth, J. Roger McSherry, William C. Root, George S. Mott; Delegate to the American Kennel Club, George Jarvis.

National Beagle Club.

THE regular quarterly meeting of the National Beagle Club of America was held at Madison Square Garden on Feb. 22. The members present were George B. Post, Jr., James W. Appleton, H. F. Schellhass, George F. Reed, William Saxby, A. J. Purinton, John Bateman, George W. Rogers, H. L. Kreuder, James L. Kernochan, Harry T. Peters, D. F. Summers and G. Mifflin Wharton.

After the minutes had been read the officers for the year were installed as follows: George B. Post, Jr., President; Herman F. Schellhass, First Vice-President; James W. Appleton, Second Vice-President; James L. Kernochan, Third Vice-President; G. Mifflin Wharton, Treasurer and Secretary; A. Wright Post, George W. Rogers and John Bateman, additional Executive Committee; Herman F. Schellhass, Delegate; Official Judges, George B. Post, Jr., George F. Reed, James W. Appleton, H. F. Schellhass, W. T. Clark and Bradford S. Turpin.

The report of the treasurer was read and ordered placed on file.

The committee on the standard were requested to make a definite report at the next quarterly meeting. The chair is to appoint a member in the place of Mr. Clark on said committee.

The report of the secretary of the Produce stake was read, and also that of the secretary of the Futurity stake for 1898.

Messrs. R. L. Bohannon, William G. Rockefeller, H. L. Pierson and Roy B. Baker were elected to membership. Messrs. Horace Porter and W. C. Duff were dropped.

G. MIFFLIN WHARTON, Sec'y.

Irish Setter Club.

Editor Forest and Stream:

The annual meeting of the Irish Setter Club of America was held at the Madison Square Garden, New York, on Feb. 22, at 8 P. M., the president, Dr. G. G. Davis, in the chair. Present: Dr. G. G. Davis, James B. Blossom, B. L. Clements, Woodruff Sutton, George H. Thomson and, by proxy, F. L. Cheney. The reading of the minutes of the previous meeting was dispensed with. The treasurer's report, showing a balance of \$70.46, was read and approved. The resignation of W. L. Washington, Esq., of New Castle, Pa., was read and on motion accepted.

It was resolved to offer \$40 at bench shows, open to members only, and \$60 at field trials, open to all, during the coming year, the manner and time of application of the money to be left to the executive committee. It was decided that the secretary be empowered to employ such means as he considers necessary to inform Irish setter men of the above resolution.

The following gentlemen were then elected to hold office during the ensuing year: President, Dr. G. G. Davis, Philadelphia, Pa.; Vice-President, James B. Blossom, New York; Secretary-Treasurer, George H. Thomson, Philadelphia, Pa.; Executive Committee, F. L. Cheney, Pittsfield, Mass.; B. L. Clements, New York; Woodruff Sutton, New York; J. Maxwell Bullock, Philadelphia, Pa.; Dr. William Jarvis, Claremont, N. H.; Ray Tompkins, Elmira, N. Y.

GEO. H. THOMSON, Sec'y.

Collie Club.

THE annual meeting of the club was held in Madison Square Garden on Feb. 22. Some business of a routine character was transacted, and last year's officers were re-elected. They are: President, Jenkins Van Schaick; Vice-Presidents, J. Pierpont Morgan and John L. Lincoln; Executive Committee, Jenkins Van Schaick, J. Pierpont Morgan, James Watson, S. L. Stewart, W. T. Ford, H. Jarrett, F. M. McWilliams, John L. Lincoln, Robert McEwen, J. A. Long and C. Y. Ford.

JAMES WATSON, Sec'y-Treas.

Irish Terrier Club of America.

BOSTON, Feb. 28.—The annual general meeting of the Irish Terrier Club of America took place at Madison Square Garden Feb. 22, at 3 P. M. The following governors were elected for 1898: President, Oliver Ames; Vice-President, W. L. Beadleston; Treasurer, S. D. Parker; Secretary, O. W. Donner; Delegate to A. K. C., Singleton Van Schaick; G. Gordon Hammill, T. Dudley Riggs, Morton E. Cobb, W. W. Caswell.

O. W. DONNER, Sec'y.

Great Dane Club.

THE annual meeting of the Great Dane Club of America, which was held at the Madison Square Garden on Feb. 21, 1898, at 8 P. M., resulted in the re-election of the old officers, viz.: Charles G. Peters, President; J. Blackburn Miller, Vice-President; C. H. Mantler, Secretary and Treasurer; G. Muss-Arnolt, Delegate to the A. K. C.

The Executive Committee will consist of Messrs. C. D. Bernheimer, A. P. Ramsdell and Clifford Wood.

Applications for membership in the club will be received by C. H. Mantler, secretary, 60 Water street, New York.

Bull Terrier Club.

A MEETING was held in Madison Square Garden on Feb. 22. The officers of the past year were re-elected. A new medal, handsome in design, was adopted. There are now twenty-six members in the club, and many more are expected to join in the present year.

The Greyhound Club.

THE club held a meeting in Madison Square Garden, and elected E. R. Ladew, President; L. C. Whiton, Vice-President; R. F. Little, Jr., Secretary-Treasurer; Executive Committee, Mrs. W. W. Green, Dr. S. D. Barr, with the officers of the club.

Western Canada Kennel Club.

WINNIPEG, Feb. 23.—The Western Canada Kennel Club's second annual show came to a most successful close on Saturday, Feb. 12. In point of numbers and excellence of quality it far surpassed that of last year. There were some fifty or sixty entries. The pointers were especially good. The setters far outnumbered any other class, there being some fifty-six English alone, although hardly up to the pointers in merit. The smaller classes, including fox terriers and cocker spaniels, can be improved on, but are gradually getting stronger each year. For the first time a genuine Russian wolfhound bitch was shown, and was purchased by Winnipeg parties. They have sent East for a mate, and no doubt in a short time the prairie coyote will be trying conclusions with these beautiful hounds. Some fair specimens of the Scotch deerhound were also on hand, one especially eliciting much admiration. The "ribbon" setters and pointers will, if present intentions are carried out, visit New York show next season.

W. L.

POINTS AND FLUSHES.

The premium list of the Kansas City Kennel Club can be obtained of the secretary, Mr. A. E. Ashbrook, Lyceum building, Kansas City, Mo. Typographically it is gotten up with rare taste. Entry fee, \$2. Entries close March 8.

Mr. Arthur Trickett, of Little Rock, Ark., who has long and favorably been known to fanciers as a bench show handler, owner of good dogs and bench show judge, has resolved to go to the Klondike in search of fortune in the gold region. In recent years he has had charge of Mr. C. A. Pratt's kennel of St. Bernards. If his success is in accord with the wishes of his many friends, good fortune will come to him quickly and largely.

Mr. Henry Klee, of the firm of Klee & Dean, New Castle, Pa., writes us as follows, under date of Feb. 10, concerning the bench show at Youngstown, O.: "The bench show that closed here this evening was very satisfactory, and attracted a large attendance. Fine dogs, especially in English setters and pointers, were abundant. The judge was Mr. John Davidson, of Monroe, Mich."

Mr. A. E. Ashbrook, of Kansas City, Mo., writes us under date of Feb. 26: "By referring to Classes 131 and 132 for Boston terriers you will notice that it reads 25lbs. and over, and under, while it should read 23lbs.; and this correction will be made in our catalogue. Our prospects for a big show are very bright, as we have received up to this time a great many entries, and inquiries are coming from all parts of the United States for prize lists. Last year we had 253 entries, but I think this year we will have over 500. We will have almost 100 dogs from St. Louis alone. All of the judges named in the prize list will be present, and everything points to a very successful show."

Mr. A. Clinton Wilmerding, the well-known fancier, had a narrow escape from death Monday morning, Feb. 21. A fire broke out in an apartment below the one he occupied on the third floor. Dense smoke drove him and his wife to the street; then he remembered that Watnong I., his spaniel, was in the apartment. He rushed back through the stifling smoke, but before he could find the dog impending suffocation forced him to the window, where a few gasps at such fresh air as was within reach revived him sufficiently to continue a hurried search for his pet. Fortunately he found him quickly—both much the worse from smoke inhaled, but neither suffered more than passing injury. The fire was extinguished before it did any damage to Mr. Wilmerding's home.

Take inventory of the good things in this issue of *Forest and Stream*. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Yachting.

THE latest development of the Seawanhaka one-design class promises a new and interesting variety of interclub competition that will be most welcome at a time when there is practically nothing in the way of large yachts to claim public attention, and which cannot fail to be of benefit to the parties directly concerned. As is well known, the Seawanhaka fleet of one-design boats, which Mr. Stearns has announced is now completed, to the number of twenty-five, except for the launching and setting up of spars and rigging, has been duplicated by two other clubs: the Corinthian Y. C. of Philadelphia, and the Country Club, of Westchester county. The Corinthian fleet, now partly completed at Harlan & Hollingsworth's yard, Wilmington, numbers seven yachts, and may be increased to ten before the season opens. The Country Club order was for nine yachts, to which one more may be added. These two fleets are built under Mr. Stearns' supervision, and to the standard Seawanhaka design. It has been intimated to the Seawanhaka C. Y. C. that the owners of the Corinthian yachts would like to visit New York waters and sail an interclub match with an equal number of yachts—seven—and at the meeting of the S. C. Y. C. last week the race committee was given full power to arrange such a match by issuing a challenge to the Corinthian Y. C. to visit Oyster Bay, and to offer a suitable trophy for the winning fleet, and if considered desirable individual prizes for helmsmen, etc. At the same time the committee was empowered to challenge the Country Club fleet to a similar interclub contest of three races, at Oyster Bay, Pelham Bay, and on a neutral course.

The absolute equality of the yachts, making the contest depend solely upon the skill of the club representatives, will add a novel element to the contest between the Delaware River and Long Island Sound, and there is little doubt that the matches will afford the best of sport to all directly interested and awaken a general interest on the part of yachtsmen and the public, while such a friendly competition must be to the advantage of both parties. The date suggested for the Corinthian matches is the end of July, following the trial races of the 20-footers off Oyster Bay (July 11, 12, 13) and preceding the New York Y. C. cruise and the international matches with the Royal St. Lawrence Y. C. at Montreal, the latter beginning on Aug. 13.

Yacht Measurement.

Editor Forest and Stream:

Having read with much interest both the report of the race committee of the Seawanhaka Corinthian Y. C. and the subsequent resulting correspondence in your journal relative to the adoption of some new mode of measurement of yachts for racing purposes, I take the liberty of addressing to you my little contribution to the general fund, not with the idea that the position that I assume is impregnable, but that if many lights are thrown upon this vexed question there is a possibility of perhaps approximating in time to a felicitous result.

Will the following axioms not be generally admitted?

1. The rule of measurement must be a simple one and not complex.
2. A measurement to be practical must be capable of being expeditiously made and while the yacht is afloat.
3. The measurement should be such that the designer or builder cannot easily cheat the rule.
4. Yachts should be so classified under the rule that the more powerful boat shall be in the higher class; in other words, that power shall be the basis of measurement.

It seems to me from an extended investigation of this question ranging over a period of many years, and viewing the subject from very many points of view, that theoretically (and I believe this will commend itself to every thoughtful person) the truest and most accurate method of comparing yachts is by their respective stabilities at some fixed angle of heel, say 20 degrees; in other words, the simplest and truest form of comparison would be to multiply the displacement of the yacht, expressed in tons or in pounds, into its righting lever at some fixed angle of heel.

Now to obtain this result means not only long calculation, but a knowledge of naval architecture, which can only be acquired by diligent and persistent study; so that we are practically barred from this means of comparing yachts.

Let us look a little further, however. Is there no feasible and readily obtained equivalent of this expression of the stability of a yacht? We have not far to go in search. The righting power of the yacht expressed in pounds multiplied by righting lever has an exact equivalent, easily and expeditiously obtained without wading through tons of calculations, and that is the force that retains the yacht at its angle of heel in equilibrium, viz., the area of the sail multiplied by the height of its center of effort above the center of gravity of the vessel. This moment multiplied by a given wind pressure, expressed in pounds, which would be a constant for all yachts, would precisely represent the expression of stability sought for.

Now it seems to me that, so far as the height of the center of effort above the center of gravity is concerned for purposes of measuring yachts, this factor can be wisely discarded, leaving it to the choice of the designer whether to cut his sails high or low, according to his fancy or the exigencies of climate, surroundings, etc. The constant, so many pounds wind pressure per square foot, can also be discarded. What then do we have left? Simply the area of the sails, and this is the form of measurement which seems to me the mode which sooner or later will at least be given a fair trial.

It may be said that it is a very radical change. That is true, but it is generally felt among thoughtful yachtsmen that something radical is needed in order either to develop a type of yacht wholesome in character, combining beauty with speed, and possessed of every good quality which can be imparted to it by skill in design and skill in construction; or if not to develop such a type to at least place such a boat on a fairly equal footing with craft built solely for racing.

Moreover I ask this simple question: What do we as Americans desire in our yachting world, and what is our aim? We have freedom in everything; why not have freedom in design? It is often said, let the fastest boat win; and this is precisely what we desire to accomplish.

What is our aim? To obtain absolute speed or speed relative to some standard, fixed by cramping taxation of elements which go to make speed and in some instances tend to detract from it. For instance, our English cousins tax girth; in other words, wetted surface, and wetted surface is generally considered to be a hindrance and not an aid to speed.

I contend that speed absolute is what is dear to the American heart.

Say we classify yachts by their sail area, making classes of 500sq.ft., 750sq.ft., 1,000sq.ft. of sail, etc. Take, for instance, a small yacht well known in Boston waters, the jib and mainsail Privateer. Here we have a 2ft. waterline boat that carries 1,100sq.ft. of sail. Is it not probable that with the same sail spread a faster yacht could be turned out, and would not this be a move in the right direction? More especially if the yacht would thereby gain certain good qualities which perhaps in the eyes of some she does not possess to-day.

Let us now view as far as we may be able the probable effect of such a rule. Take four examples of types, each carrying say 600sq.ft. of sail: Fig. 1 representing the broad and shallow centerboard type; Fig. 2 the medium wholesome, fixed keel type; Fig. 3 the deep and narrow boat of former English fashion, and Fig. 4 the bulb keel of the present type.

We will assign for means of comparison the same righting power to each; that is to say, each boat will carry the 600sq.ft. of sail equally well.

Under these questions No. 1 will be the shortest on load waterline, and will have light displacement, because the natural righting lever is largely increased by adding to the beam. She will have rather large wetted surface.

No. 2 will have slightly greater length and slightly greater displacement, but aided by a lower position of center of gravity and less wetted surface will be more compact.

No. 3 will have still greater length, but to compensate for the very much shortened righting lever at moderate angles of heel will have largely increased displacement and wetted surface will be great.

Of No. 4 not much need be said. She will be fast, and at first appearance one might say your rule would produce simply bulb keels, that is all.

Not so fast. Many can remember (and it is to a certain extent the case to-day) when boats were divided into two classes, viz., centerboards and keels. To-day many keel boats not only equal, but in many instances surpass the centerboards. Why not, following out this idea, divide boats not as centerboards and keels, but as fin and bulb keels (accurately defining them) and other boats. Then if a man wishes to build a bulb keel he is at perfect liberty to do so, and he will find others of like tendencies who will be ready to race with him; but the man who desires something more than a mere machine, who wants a boat that will be strong and serviceable, and on which he can visit a sand bank now and then without fear of damage, will choose No. 2, I believe, and in so doing he will possess a good all-round boat, good in any weather, and good enough to race too on even terms.

That there are pros and cons on this question I am very ready to admit, but there is one matter to which I would call your attention. America leads; does not follow. If any good rule is adopted in this country it should spring up in this country. We cannot adopt somebody else's rule unless somebody else's has shown splendid qualities.

If I had time and was not disinclined to weary you I should like to speak of the types of yachts which each well-known form of measurement has given rise to in England, in France and in the United States. But these facts are well known to your many readers and can be passed by.

To be sure the mode of measuring yachts by sail area alone was advocated by that pioneer in English yacht designing P. R. Marrett, but there is one thing to say, the rule has never been adopted. Other measurements have been employed, and in the opinion of thoughtful men have failed to develop in general what may be considered the best and most wholesome types.

Why not try sail area and see what type will result? Experience alone will prove its efficacy or its deficiency.

The locality would largely regulate the type of yacht constructed under this rule, and what could then be more general in character or better adapted to the exigencies of widely different conditions such as prevail in the interior of this country and on the sea board.

It may be thought by many that such a rule would tend to produce very attenuated forms. But a competent naval architect well knows, give a boat small area of midship section, with extremely fine lines forward and aft, and such yachts are only good in light weather, and more powerful hulls will quickly outstrip them with a rising wind and a rising sea.

Moreover, so far as small yachts are concerned, they will always be given a fair proportion of beam, because it is a natural law in yacht construction that as the tonnage diminishes so should the proportionate beam and consequent sail carrying power increase in order to enable the small craft to overcome the natural obstacle which she has to encounter in the way of speed, viz., that for a given volume the surface exposed is largely in excess proportionately of that for craft of larger tonnage, and to make a good showing in point of speed she must be relatively to the larger yacht a more powerful craft.

By using sail area as the mode of measuring and classifying yachts no time allowance is needed.

In actually measuring the sails it seems to me advisable to confine the tax to what may be designated working sails. For example, a cutter or sloop, measure:

First.—Area of mainsail.

Second.—Area of forward triangle, the three points of which would be: (1) Where jib stay cuts bowsprit; (2) where jib stay cuts mast; (3) intersection of forward side of mast with deck.

Third.—Area of working topsail triangle, the three points of which would be: (1) Topsail halyard sheave; (2) topsail sheet sheave; (3) intersection of main gaff with after edge of mast.

Free latitude is thus given the use of large clubtopsails, jibtopsails and spinnaker untaxed. These sails are only carried in moderate weather, and the presumption would be that yachts would be constructed to carry the sails for which they were taxed in good fresh breezes, and in moderate weather they would fly their kites.

Now I am not going to write a treatise, but in closing this article I cannot refrain from speaking of one or two matters which bear directly upon the question in view.

First.—What has been the result in England in the experience of the Yacht Racing Association in passing from Dixon Kemp's rule

Length × Sail Area
6,000

to the present girth rule so far as small yachts are concerned? Norman, built by Sibbick under the old rule, is a better boat than Heartsease, by the same builder under the girth rule. And why was a committee of very competent men, including Mr. Froude, selected to devise a formula which would produce a better type of boat in the smaller classes? The present rule therefore does not give satisfaction. What did the committee recommend? To leave out of the formula sail area and to tax length and especially beam and depth heavily. This committee struck the keynote, correct in principle, either tax your hull or tax your sail. Don't tax both. The committee (if I may be permitted to venture an opinion) with deep English conservatism hit beam and depth pretty hard, and so the Y. R. A. would have nothing to do with its recommendations.

Second.—In our own country lately several excellent formulæ have been proposed. These formulæ could not but give good satisfaction, as they have been devised by very experienced men.

The formulæ seem to me, however, open to this objection: The measurement results from these formulæ would have to be deduced from accurate drawings of yachts, and therefore such formulæ would not seem to be adapted to the quick needs of a yacht measurer, who would only take such results on faith, and that would not mean measurement.

In closing I may appropriately quote a few words by William Cooper (Vanderdecken), one of the truest yachtsmen that this century has produced. He says, speaking of the far-famed America: "Then there is a very important element in the construction and fitting of a yacht, which tends more than anything to success, and that is, the proper adjustment of displacement and driving power, and we are quite sure that in this respect the America had no rival, and I have a strong idea that her great achievement may in part be attributed to the care and attention bestowed upon her in this important matter."

ISAAC B. MILLS.

BOSTON, Feb. 5.

Treatise on the Construction of Sailing Yachts.

WE have frequently had occasion to comment on the growth of yachting literature in France as evidence of the progress and prosperity of yachting in that country, and we note with pleasure the publication of a new and important work, the latest addition to the "Library of the Union of French Yachts," published by Messrs. E. Bernard & Co., Paris. This series already numbers such standard works as the French edition of Dixon Kemp's two books, and the "Elements of Astronomy and Navigation," by J. de Chabannes la Palice, the noted French yachtsman. The latest edition is entitled "Traité de la Construction des Yachts à Voiles" ("Treatise on the Construction of Sailing Yachts"), the author being Mr. C. M. Chevreux, the French yacht designer.

The book, which is an octavo volume of over 300 pages, is devoted exclusively to practical yacht construction, the author explaining in the préface that this subject was selected as of more immediate value to builders than the subject of the geometry of the yacht (practical drafting and designing), which would naturally precede it.

The book begins with the assumption that the design is completed and all calculations made, the first work of the builder being the consideration of the table of scantling, presumably furnished by the designer. The dimensions of all parts determined on, the table of offsets is described, with the practical operation of lay-off

LIBELLULE.—ONE-TON FIN-KEEL, DESIGNED AND BUILT BY MR. GODINET.

LUCIOLE II.—RACING 10-TONNER, DESIGNED AND BUILT BY ABEL LEMARCHAND.

NOUGATINE.—DESIGNED AND CONSTRUCTED BY MR. GUEDON.

lead keels and their details, centerboards, special methods of planking and fin-keel construction. Chapter VII. deals with riveting, fastening, painting, launching and ways for hauling. Mast and rigging fills the eighth chapter, with dimensions of spars and details of rig; the working drawings of spar iron work which illustrate this part being particularly good. In Chapter IX. the subject of yacht boats, with sizes of boats for different classes of yachts and details of boat building, are treated very thoroughly. Chapter X. deals with the internal arrangement and fittings of yachts, and the final chapter with the woods used in yacht and boat building.

We have already mentioned the illustrations accompanying the letterpress, which are numerous and excellent, including many detail plans of parts. In addition to these are two photo reproductions of small yachts, Trilby and Quatre-Etoiles, under construction in the shop.

Accompanying the book is a portfolio of plates, thirty in number, and each 30 by 11 in., with designs of modern French yachts, the work of such designers as Messrs. Sahuqué, Lemarchand, Tellier, Caillebotte, Guédon and the author. These designs include all types, keel, centerboard and fin-keel, both racing and cruising; the details of construction being given in many cases as well as the lines. We reproduce three of the designs: Libellule, the fin-keel one-tonner by the U. des Y. F. rule; the 2-tonner Nougatine, and the noted 10-tonner Luciole II.

In this book Mr. Chevreux has done much for the advancement of yachting in France, both in showing to the world what has already been done, and in giving to French builders, amateurs and yachtsmen most valuable assistance in their future work. Though written in French, the book is so general in its treatment of the subject as to be valuable to American builders and yachtsmen.

Yacht Stoves.

Editor Forest and Stream:

Answering your request for stove experiences, I have used apparatus for this purpose in the following order: Plumber's gasoline furnace, Sestalit or patent fuel stove, wick burner stoves of the Florence type, gasoline stoves and oil gas stoves.

I have cruised for ten successive seasons; two in a 20ft. open gilling skiff, with a plumber's furnace for a stove, with a lanyard fastened to the frame to save it should necessity arise to tip it overboard in case of accident.

Five seasons in a 28ft. cabin sloop with Sestalit, or patent fuel stove, inhaling the fumes, our nostrils and throats doing the duty of chimneys; wick burner stoves of the Florence type, which smoked badly in a seaway, and gasoline stoves with reservoirs containing enough explosive to blow us out of the water.

Three seasons in a 40ft. sloop with an oil gas stove, which I found satisfactory except for the expense attending the replacing of burners and retorts. In the order named each stove is better than its predecessor.

This season I shall install kerosene stoves of the Primus type, and from my observations of their work on other yachts last season I feel confident that they will give good service.

I shall be glad to give you my experiences with this form of machinery at the end of this season.

JULNAR.

on the mould loft floor. Following this comes the taking of the bevels from the body plan and the preparation of the various moulds. The second chapter deals with the preparation of the keel, stem and sternpost, the laying of the keel blocks and keel, getting out and beveling the frames, general systems of construction of frame, counter, etc., the erection of the frame, the planking and decking. All the details are illustrated by numerous diagrams and plans.

Chapter III. is devoted to metal and composite construction, with tables of scantling for iron and steel. The fourth chapter treats of the deck fittings and attachments to the hull, such as bulwarks, cleats, keels, mast bitts, bowsprit bitts, skylights, companion and other hatches, rudder, etc.; and the fifth is devoted to the hull iron work, both being very fully and clearly illustrated. Chapter VI. deals with special constructions, including

WISSAHICKON HEIGHTS, Philadelphia, Pa.—*Editor Forest and Stream:* Having seen in looking over the latest number of the FOREST AND STREAM a general inquiry as to the best kind of stoves to use aboard cruising yachts, I have thought that possibly my limited ex-

perience might prove of some use to any one thinking of cruising in a small boat.

I have cruised more, or less along the Jersey coast, snipe hunting, in the late summer and early fall, and consequently employed rather a small yacht. The boat in which I did most of my cruising was a 23ft. cat, of the fore-and-aft overhang type, and it was necessary to have a stove which could be stowed out of the way when necessary, but which would perform efficiently the duties required of it. I first used a gasoline stove, which I found heated the cabin to such an extent when preparing supper that it was very difficult to get it cool enough for comfortable sleeping on warm, quiet nights by the time we were ready to turn in. At the same time gasoline is rather an uncertain quantity, and one does not care to take too many liberties with it, particularly as I often found it necessary to cook, eat and sail all at one time.

I used the gasoline stove for one season, and then purchased a three-burner kerosene-oil stove. I had more satisfaction out of this one little stove than one would imagine. It never seemed to make the cabin uncomfortably hot, and in the evening this is most important, as any one who has cruised along the Jersey coast during the warm months will readily understand, owing to the unceasing efforts of the Great Jersey Razor-bill (mosquito), who makes cooking or anything else in the open air in the evening next to impossible. It never appeared to me to be in any way dangerous, and I never felt anxious when my boat was knocking about in a small sea and the stove was going at the same time.

Another advantage which a coal-oil stove possesses over some others is shown by the ease with which kerosene may be procured almost anywhere, while it is comparatively hard to find gasoline and some of the other stuffs used for burning in stoves. My stove had three burners, set over the reservoir for the oil, and over each burner was a grating on which to set pots, kettles, pans, or anything else, all joined in a solid top. It was about 3ft. long, 1½ft. high, and about 1½ft. across, with no "outrigging," so to speak, which could be in the way. The reservoir held, I should think, about 2 to 3 gallons. Altogether it answered exactly the purpose for which I wanted it, and never gave me the slightest trouble.

I have written this simply from my own experience, which has not been a very extended one at the best. And it will probably interest only those who care to do the kind of cruising which I do; but for such purposes I do not think any one can very much improve on a stove such as the one I have just described.

CHARLES M. HARRIS.

Aluminum in Naval Construction.

APROPPOS of the important paper on Defender and aluminum in naval construction by R. P. Hobson, Assistant Naval Constructor, U. S. N., recently reprinted in the FOREST AND STREAM from the Proceedings of the U. S. Naval Institute, the last quarterly issue of that journal contains the following, by Prof. A. H. Sabin.

My own (unpublished) experiments have shown that rolled aluminum plates have a foliated structure, and while the corroding action of sea water is rather slow on the sides of a plate it is rapid and penetrating where it acts on the edges. A plate ⅝in. thick was not rusted through by immersion in sea water (in a cask) in eight months, but was entirely destroyed to a distance of ⅓in. from the edge and the edge was swelled up to a thickness of ¾in., looking like a bunch of paper. The plate experimented on was pure aluminum, and was not exposed to galvanic action. It seems to me that this throws light on the corrosion around bolt holes and the like; the water gets in and then it destroys the metal around the edge of the hole. This agrees with the statement of Mr. Hobson that the joints swelled and strained the rivets. No doubt the presence of some other metal aggravates the trouble by inducing galvanic action.

It is quite practicable to coat aluminum so as to effectually protect it from sea water. The "pipe coating" described in my paper gives practical protection. The trouble with any coating is that it is liable to be scratched or worn off, and I do not see how this difficulty can ever be avoided. For example, it is of very little use to depend on a coating for protecting the sides of a hatch because it will be rapidly worn off, while an air pipe or cowl may probably be kept in good condition for a long time. Even if it gets scratched off in places, these may be retouched by some suitable air-drying varnish; but no coating can ever be depended on for resistance against constant wear. No coating has ever been applied which is of considerable thickness, and in the nature of things it is liable to be worn or scraped off. I have no confidence in protecting the outside of the bottom of a vessel by any coating if the metal is aluminum; on steel, which is much less liable to corrosion, it may possibly be of some substantial use. All our experiments show, and I think have fairly proved, that by far the best protection is given by a properly made baked coating; and this is reasonable, for if the material used will stand the heat it is hardened and made more impermeable, while its adhesiveness is not lessened. It is entirely practicable to apply this process to articles of considerable size; it has already been used on pipe sections 25ft. long and 5ft. in diameter, and it can be quite as well applied to even larger objects. It would of course be advantageous to get the same results with a coating not needing baking, but it has not yet been done. Some of the varnishes have, however, given excellent results. If a varnish is used it should be of special quality, and a considerable number of coats should be applied—not less than three, and probably eight or ten would be better. I have no doubt that in this way aluminum may be efficiently protected, but if the coating is scraped off the protection ceases at once.

Andrew Peterson, the Excelsior boat builder, is in receipt of an order for a mahogany sailing yacht, to be 40ft. over all, 30ft. l.w.l., to cost \$1,000, and be of a different type from the class that made him famous. She is to be a keel boat, and when completed will be shipped to China. Rumor has it that the order came from John Goodnow, Consular-General at Shanghai. The boat will be sloop rigged.—*Minneapolis Tribune.*

YACHTING NEWS NOTES.

Ibis, steam yacht, of Boston, arrived at Nassau on Feb. 11. Utowana, steam yacht, A. V. Armour, is now in Florida waters. May, steam yacht, Mrs. Alexander Van Rensselaer, was at Savannah on Feb. 19, en route from Philadelphia to St. Thomas.

Penelope, steam yacht, nee Cleopatra, under charter to John Shepherd, of Boston, sailed from New York on Feb. 20 for Tampa, Fla.

Barracouta, steam yacht, D. P. Reighard, arrived at Nassau on Feb. 12 from Philadelphia.

Hildegard, schr., G. W. Weld, has wintered at her builder's yard, Wilmington, where she has been refitted recently with a new sea-going rig, under the direction of A. S. Chesebrough, her designer. She will sail this month for a West Indian cruise.

The Spalding St. Lawrence Boat Co. has made a change in its catalogues this year. In place of one large catalogue it is issuing a number of smaller ones, each describing a special branch of its work. One of these is devoted to small power launches, another to small sailing craft suitable for one-design classes, and a third to yacht boats. The latter contains some excellent photos of dinghies, cutters and gigs lately built for different sail and steam yachts: Buccaneer, Tampa, Enterprise, Intrepid and others.

The February meeting of the Seawanhaka C. Y. C. was held last week at the town club house. The race committee announced that it proposed to build one and possibly two 20-footers from designs by C. H. Crane, the estimated cost being \$2,000 for one and \$3,800 for two, including the expense of sending one boat to Montreal and racing her for the cup. It also announced that the members of the Corinthian Y. C. of Philadelphia who would own the new one-design knockabouts were desirous of visiting the Sound for a series of intercity matches; and on motion the committee was empowered to issue a challenge to the Corinthian Y. C., and to make all arrangements for such races; also to challenge the fleet of the Country Club to a similar series of matches. It was also announced that the races for the Seawanhaka international cup would begin on Saturday, Aug. 13.

Mr. B. B. Crowninshield has an order for a design for a 32ft. R. M. cutter under the rules of the Y. R. U. of the Great Lakes for Mr. R. H. Fenwick; of Chatham, Ont., and also for a racing yacht 26ft. over all, 18ft. l.w.l., 7ft. beam and 2ft. draft, for Mr. John Robson, of Boston.

The Corinthian Y. C. of Marblehead announces the following fixtures: June 18, club race; July 2, club race; July 16, first championship; July 30, club race; Aug. 3, 4 and 5, midsummer series (invitation); Aug. 6, open race; Aug. 13, second championship; Aug. 27, third championship; Sept. 3, 4 and 5, Labor Day cruise. Ladies' day to be announced.

At its annual meeting on Feb. 21 the Jeffries Y. C., of East Boston, elected the following officers: Com., Elmer E. Gray; Vice-Com., F. L. Tilton, M.D.; Fleet Capt., Walter S. McLaughlin; Treas., Ambrose A. Martin; Sec'y, Alfred E. Wellington; Treas., Walter S. McLaughlin; Regatta Committee: Ambrose A. Martin, Jacob Rood, Charles L. Joy; Directors: Elmer E. Gray, William B. Pigeon, Charles L. Joy, W. B. Starkweather, Ambrose A. Martin, Jacob Rood, Alfred E. Wellington, George A. Anderson, Walter S. McLaughlin, Herbert F. Vaughn, John Marno, Frank H. Tilton, M.D., H. H. Smith, E. A. Skinner. On May 1 the club will celebrate its twenty-fifth anniversary.

Muriel, c. b. sloop, has been sold by Herbert F. Nute, of Boston, to F. M. Randall, of New York. Muriel has been very successful as a racer in the Y. R. A. races about Boston.

The Norwalk Y. C. held its annual meeting on Feb. 26, the following officers being elected: Com., Philip G. Sanford; Vice-Com., George A. Jennings; Rear-Com., John H. Ferris; Treas., Jos. R. Taylor; Sec'y, Horace S. Hatch; Ass't Sec'y, Robert G. Mitchell; Meas., Orlando I. Allen; Governing Committee: Gilbert E. Bogart, Alfred E. Chasmar, Aurelius J. Meeker, Herbert A. Mathewson, Herbert R. Smith; Regatta Committee: Samuel Lynes, Wm. F. Acton, Frank Nash.

The Buffalo Canoe Club Dinner.

By One who was There.

FIVE commodores, ex-commodores, vice-commodores and rear-commodores, by name Dunnell, Hogan, Dater, Hale and Pinkney, set sail for Buffalo on Saturday night, Feb. 19, to attend the fifteenth annual dinner of the Buffalo Canoe Club on the eve of Washington's Birthday. The commodores landed about 10 o'clock the next morning, and were immediately seized upon by Com. Forbush, Willy Williams, Frank Danforth and Walter English, with his latest double-spinaker collarette, who jostled them into a nearby restaurant, after the preliminary cordialities had been finished, and filled them up with the good things of this life, as the train was over two hours late, and five aching voids needed attention. This was but one instance of the genuine heartiness of our welcome, and the cordial attention extended us during our entire stay. Truly, the Buffaloes are right jolly blades, and ideal hosts. We New Yorkers will doubly certify to that, even if we are awakened in the middle of the night to do so.

But I am digressing. An elegant little dinner at the Niagara Hotel was enjoyed a few hours later by eighteen or twenty of us; a drive to the Country Club through the handsome residence portion of the town, and a delightful little supper at Mr. Danforth's for some of us, while the rest were most royally entertained by Charley Forbush, finished up the first day of our stay in that royal city.

Next morning we arose at 6 o'clock, and Dad Thorne engineered a trip to the Canoe Club house, which is delightfully situated on the Canadian shore of the lake, but which is rather difficult of access in the winter. The trip nevertheless was most interesting, and all who went were most enthusiastic.

Remember, the Buffalonians housed, fed and transported us, and in every way evidenced that brotherly love which is common to all canoeists, be they navigating the land or the water, and the unanimous verdict of the five commodores was that they would not "do a thing" to the boys when they again struck New York.

Com. Forbush (God bless him!), those royal good fellows ex-Com. McNab, Willy Williams, Charley Skis-senhoefer (who will lead the choir at next year's meet), Allen Monroe, Kelly, the Messrs. Lansing, Potter, Jarvis, and a host of others, certainly did everything up to the queen's own taste, as Howell, Sparrow and Wilson, the commodore of the Toronto Canoe Club, will certainly testify.

The dinner occurred Monday night. But before going any further I wish to state that a party of thirty of us went to Niagara Falls Tuesday morning in a parlor trolley car, a distance of twenty-three miles, stopping en route at the site of the Pan-American Exposition to be held some time in 1898; the famous power house, through the medium of which the great falls are harnessed, and to the bottom of whose pits the water falls 185ft. on turbines. The rest of the day was spent about the Falls, lunching, and a trip down the "George," as Ho called it. About 2in. of snow had fallen the night before, and as there had been no wind the effect on the trees and "shrubbage" (again Ho) was extremely beautiful and enhanced the natural attractiveness of the scenery.

And now the dinner. Ye gods! Last Monday night, and I am still smacking my lips. Dad Thorne worked like a slave to decorate the large dining room of the Niagara, and it was a fairyland when he rested from his labors. Flags, plants, pictures, trophies filled all the available crannies, and testified to the ability and artistic instincts of the Captain. The dinner itself was delightfully served and excellently cooked, and the liqueurs slipped down one's throat as though one had been used to such things all one's life. Com. Forbush presided most gracefully, and again and again evidenced the merits which had elected him to his office. Com. Dunnell was the first speaker, and outlined to the boys the nature of the A. C. A. camp, and gave them a clear understanding of the royal good times we have there; and when he had finished Com. Forbush promised him thirty men from his club at the 1898 meet. Com. Dunnell acknowledged the courtesy of the Buffalo Canoe Club in agreeing to use the one and one-third fare round trip granted by the railroads, as this enabled him to carry out his plans, which would probably have otherwise miscarried. Speeches were made by the organizer of the club, Mr. Lansing; Com. M. T. Bennett, who was the guest of Dad Thorne, and who was not included among the five commodores first mentioned, as he did not travel with the "push;" Com. Dater, Captain "G. B. Y." Hogan, who borrowed Harry Dater's hearty "God bless you," and almost improved upon its delivery—but not quite; recitations by Mr. Paul Jarvis, who ultimately responded to the toast, "The Ladies," and songs by an excellent quartet, of which Charley Skiss was first tenor, which sang admirably, as did one or two others present; all of which tended to make the dinner one of the most successful that had ever been held by the Buffaloes or any other club.

We New Yorkers went home Tuesday night, vowing that the Buffaloes were the best fellows that ever lived; and I do not think we came far from it. As I said before, they are ideal hosts, and I have left many warm friends there whose acquaintance I hope to renew at the meet, if not before. As Ho and Harry Dater say, "God bless them."

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 8-10.—St. Thomas, Ont.—Tournament of the St. Thomas Gun Club. Targets and live birds. Added money, and an international live-bird trophy. Under the management of Jack Parker.

March 15-18.—Utica, N. Y.—Tournament of the Oneida County Sportsmen's Association. Live birds and targets. Open to all. Henry L. Gates, Pres.

March 17.—Wellington, Mass.—Tournament of the Boston Shooting Association. Sweepstakes optional. Targets, 15 events. O. R. Dickey, Manager.

March 22-23.—Stanhope, Ia.—Central Iowa shooting tournament, for amateurs only. Gold medal representing Iowa championship. Manufacturers' agents allowed to shoot for price of targets and birds.

March 22-24.—Elkwood Park, Long Branch, N. J.—Interstate Association's sixth annual Grand American Handicap. 25 birds, \$25, birds extra; \$1,500 guaranteed to the three high guns; \$600, \$500 and \$400; all surplus added.

March 28-30.—Galena, Kans.—Interstate shoot. Two days targets; one day live birds; \$50 a day added. W. W. McIlhany, Sec'y.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Sec'y.

April 5-8.—Baltimore, Md.—Annual spring tournament of the Baltimore Shooting Association. Geo. L. Harrison, Sec'y-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 7-9.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting park, under the management of J. A. Corry.

April 8.—Bridgeport, Conn.—Target tournament of the Bridgeport Gun Club. J. G. Kingsbury, Sec'y.

April 13-15.—Atchison, Kan.—Manufacturers' fourth annual tournament. Added money later. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, manager. Address all communications to J. L. Head, Peru, Ind.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

Under date of Feb. 25 Mr. John L. Lequin, secretary of the Interstate Association, writes as follows: "We have received inquiries from most all directions recently, from a number of shooters who are desirous of entering the Grand American Handicap next month, concerning the weight of guns, and whether the fore and hold and recoil pad will be counted as a part of the gun when weighed. The subject has been placed before the tournament committee of this Association, which committee has decided that the guns will be weighed naked."

The chief feature of this day's events was the phenomenal

Of those who finished with 24 McMurchy came the nearest to killing out, as his lost bird, a hot left-quarterer, fell dead only a few feet out. Trimble's lost bird was one of that peculiar kind. It was knocked down and to all appearances it was dead, but when the boy went to retrieve it it got up and struggled out of bounds. Fanning's bird, not a very fast one, apparently was not hit with either barrel, yet it flew against the fence with an

Hot Springs Vapors.

Mr. G. F. Simmons, of Peoria, Ill., secretary of the Illinois State Sportsmen's Association, arrived in the Springs several days before the commencement of the tournament, but was unable to remain, being called home on account of the serious illness of his wife.

Funk and Garrett, the two Colorado shooters, created a most favorable impression. If they are a fair sample of the Western shooters, send along more of them next time.

Faurete perhaps felt as though his handicap was a trifle too severe. However, he never murmured or complained, but shot along the best he could. A yard nearer would most likely have landed him in the 21 hole, as two of his lost birds just managed to struggle out of bounds. That 99 out of 100 last October was responsible for placing him at 31yds. Frank expects to take in the Grand American. It is then that that supper Heikes and Budd and Gilbert and Bartlett won of him and Winston will be eaten.

Eaton is a quite unpretentious young fellow who will probably be heard from on the Western circuit this season.

That Marshalltown, Ia., trio made a host of friends by their quiet and gentlemanly demeanor. Such sportsmen contribute much toward the success of a shoot.

This was Tom Graham's first trip South, and for some reason or other he failed to shoot up to his usual high standard. Try it again, Tom, and perhaps next time you will demonstrate to the Southerner just how good a shot you are.

Charley Young was clearly out of form on targets. It was amusing to hear him explain how he lost his first pigeon in the handicap. He said: "I hit him right in the middle of the back, and though it brought a cloud of feathers he wouldn't have it, but kept right on."

Col. Martin, he of rotund appearance and genial good nature, shot way up to the top at times, but was hampered by having to shoot all kinds of shells. On the fourth day his was one of the high guns. He missed several occasions to land good money by losing his last target. One of these losses occurred by not having his safety up.

Mr. C. J. Schmelzer, of the Schmelzer Arms Co., of Kansas City, was present at the tournament, and while not participating took much interest in the shooting. Mr. Schmelzer is the donor of the Schmelzer cup, which represents the target championship at reversed angles. It will be remembered that Heikes, Van Dyke and Young tied for the cup at San Antonio in January, 1897, and that this tie was never decided. Mr. Schmelzer states that one of the conditions of the cup is that it must be put up in open competition once a year, and that now more than thirteen months have elapsed and no such contest had taken place. He holds that Messrs. Heikes, Van Dyke and Young had forfeited all rights to the trophy, and that there will be an open contest for it at Charlie Budd's shoot at Des Moines, Ia., the third week in April, 100 targets, reverse angles, entrance price of targets.

Mr. Irby Bennett, of the Winchester Arms Co., was present just long enough to shake hands all around and say good-by. Almost as soon as he arrived on the grounds he received a telegram calling him East at once. The war scare is probably responsible for this.

That \$4 tax on the paid shooter did not work much of a hardship on Heikes, as he got a piece of the high gun money each day, so he was not out anything by this tax.

All those who were fortunate enough to be one of that special-car party from Indianapolis were loud in their praise of Mr. John M. Lilly, as he made all the arrangements for the trip, and left nothing undone that would add to the comfort or pleasure of those who were of the party. To Mr. Lilly belongs all the credit for the success of the trip. Mrs. Lilly and daughter and Mrs. Beck also accompanied the party.

There was a childish display of temper on the part of a certain shooter for some fancied or imaginary defect in his gun, or more probably because he did not point it right; he became so enraged that he deliberately brought his fine ejector gun down on the ground with such force as to wreck it completely.

Pa Beck did not get a part of high gun money, but he managed to make a straight now and then. But above all he kept the shooters in high spirit by the number of good vars he is able to tell. It would be rather singular indeed if Pa did not have a new one to spring on the gang.

Mr. Macalister and wife are sojourning at the Springs. Mr. Macalister's reputation as a shooter is well established, but it is not generally known that Mrs. Macalister is one of the best lady shots in the country. On the Saturday prior to the commencement of the tournament she broke 45 targets out of 50. True, five of these breaks were made with the second barrel, but even at that it was a very creditable performance, and excelled the score made by her husband and Mr. Young on that particular occasion.

Col. Courtney sustained a very severe injury to his thumb, which pained him so that he was unable to shoot the programme out. Herbert Taylor, the only other trade representative who dropped out, was handicapped by a new gun.

Jack Fanning's work on targets was very indifferent, but it was in the live-bird handicap that he showed what a really good shot he is. To score 24 out of 25 of such birds as were trapped in the handicap from the 32yds. mark is truly a performance to be proud of. This was equalled by only one other scratch man, Frank Parmelee duplicating the feat under precisely the same conditions.

The guns and loads used at this tournament foot up as follows: Guns—Smith 18, Parker 12, Winchester 6, Greener 5, Wesley Richards 1, Purdy 1, Claybrough 1, and Daly 1. Powders—Du Pont 26, E. C. 9, Schultze 5, Hazard 4, Gold Dust 4, King 3, and W-A L. Shells—U. M. C. 24, Winchester 16, Peters 3, while five others shot U. M. C. and Winchester combined.

PAUL R. LITZKE.

Dansville Gun Club.

DANSVILLE, N. Y., Feb. 18.—The Dansville Gun Club held its regular practice shoot to-day. The attendance was smaller than usual, due no doubt to the threatening weather, but the afternoon proved to be pleasant, and the members who ventured out to the grounds were well paid for their trouble, as the sport was fine. Everybody went away satisfied that they had gotten their money's worth of shooting for one day. The club's best previous average for a day's shooting was raised three points to 59 per cent., as the following scores will show:

Event No. 8 was at unknown traps, known angles:	
Events:	1 2 3 4 5 6 7 8 9 10

WILLEY, Sec'y.

Holiday Shoot at Pawling, N. Y.

PAWLING, N. Y., Feb. 22.—To-day being Washington's Birthday, the Pawling Gun Club held an all-day shoot at targets. The weather of the past four days was such that it was sufficient to discourage any but the most enthusiastic trap-shooters from braving the elements in search of sport. To-day was not much better, only instead of rain it was a case of snow squalls all day. The attendance therefore was quite light. There was but little wind, but the light was very deceiving, and the background of wooded hills made it hard to see the targets. The club too has a set of bluerock expert traps that can and do throw the targets "out of sight" in more senses than one. When keyed up for business, as on this day, they threw the targets fully 60 to 65yds. The slope of the hill side, on which the grounds are located, made it extremely difficult to properly gauge the flight of the targets. Hence many lamentable "fall downs."

Among those present from a distance were: Edward Banks, secretary of the American E. C. & Schultze Powder Co.; Ferd Van Dyke, of the Winchester Co., shooting Lafin & Rand's W-A powder; Mrs. M. F. Lindsley, of Cincinnati, O., looking after the interests of King's Smokeless and Peters' cartridges; Jacob Pentz, of New York; H. Nelson and J. G. Dutcher, also of New York; H. Lefurgy, of Hastings, N. Y.; W. H. Hyland and Miss M. E. Hyland, his young daughter, from Tarrytown, N. Y.; I. Tallman and C. Foster, Millbrook, N. Y.; C. Schou, Jr., and H. Sisson, Poughkeepsie, N. Y., etc.

The management of the shoot was in the hands of F. C. Taber, president of the home club; Mort Haynes, its secretary, and G. A. Daniels, the club's treasurer. Mr. Daniels, assisted by Mr. Lefurgy, took charge of the cashier's department in a most efficient manner; T. E. Roberts acted as referee, and did his work well, his eyesight being better than that of most of the shooters; Ferd Chapman, the puller, did his work capably, balks being very few and far between. Three traps were used, being set Sergeant system, the angles on quartering targets being specially acute. The club's small club house was well filled, many spectators being on hand to watch the shooting; yet there was room for the shooters as well, although the crowd was a little bit thick when the time came to attack the free lunch set before its guests by the Pawling Gun Club. All in all, it was a very pleasant shoot, notwithstanding the weather.

Below are the scores made in the programme events, Van Dyke carrying off first honors quite easily:

Programme Events.	
Events:	1 2 3 4 5 6 7 8 9 10 11 12
Targets:	10 10 20 10 20 10 15 10 15 20 10 15
E Banks	5 6 16 9 12 9 12 5 13 15 10 12

H Sisson	6 6 6 3 6 7 6 6
W H Hyland	10 7 9
H Lefurgy	9
H Holmes	1
Miss M Hyland	5 8

After the programme events had been shot out, twelve extras, all 10-target events, were decided. All these events, like those on the programme, were at unknown angles, with the exception of No. 8, which was at 5 pairs. In this event Banks won first with 9, Van Dyke was second with 8, Dutcher and Tallman divided third on 7. Scores in the extras were as below:

Extras.	
Events:	1 2 3 4 5 6 7 8 9 10 11 12

Trap Around Reading.

READING, Pa., Feb. 19.—Harry J. Coldren, wing shot, of this place, has challenged Epler, who I think shoots under the name of Wellington, the champion of Harrisburg, at 100 live birds, for \$100 a side. The event will take place at Lebanon, Pa., if Epler accepts.

Schuylkill Haven, Pa., Feb. 18.—The following is the result of a sweepstake live-bird shooting match held by J. A. Binkley, of this place. Lincoln Kline, of Pottsville, was referee; Walter Bast and Thomas Miller judge and scorer respectively. Money divided; first between Walker, Johnson, Kepner and Burns. First event, 7 birds, entrance \$5, birds extra: D. Walker, Pottsville, 6; D. Wise, Minersville, 5; I. H. Becker, Schuylkill Haven, 3; Achenebach, Schuylkill Haven, 3; Canfield, Cumbo, 4; James, Schuylkill Haven, 1; Zimmerman, Schuylkill Haven, 5; Roeder, Schuylkill Haven, 4; Schaffner, Schuylkill Haven, 5; Lawren, Mahanoy City, 4; Johnson, Pottsville, 6; Burns, Schuylkill Haven, 6; Kepner, Orwigsburg, 6; Albright, Orwigsburg, 1.

Over 100 birds were shot at in miss-and-out events, and after the live birds were all gone the blue rock traps were put in use. The principal event at blue rocks was 15 blue rocks, entrance \$1.50, which was won by Zimmerman, of Schuylkill Haven, break-13 out of 15. Another large shoot is being arranged for Feb. 26.

Pottstown, Pa., Feb. 16.—Sportsmen from Reading, Royersford, Pottstown, Spring City, Churchville, Fagleysville, Boyertown and a number of other places were present at a live-bird tournament at Swamp P. O., near here. Good shooting was interfered with by high wind. Summary:

First event, 5 birds: Trumbauer, Shaner, Evans, E. Nettles, 4 each; Sheeler, Nuss, Urner, Fink, Benner, Leavengood, 3 each; F. Nettles, Yergler, Beist, Major, Bauer, Wein, Croll, Rambo, Rodgers, 2 each; Stauffer, 1.

Second event, 7 birds: Trumbauer, 7; Hartman and Sheeler, 6 each; Croll, 5; Yergler, Nuss, Esterly, R. Smith, Hawkins, Roshon, Evans, Geist, Fink, Leavengood, 4 each; Benner, F. Nettles, F. Smith, Ziegler, Stauffer, E. Nettles, 3 each; Shaner and Bauer, 2 each; Wills and Wein, 1 each.

Norristown, Pa., Feb. 15.—There was a lively shooting match at live birds at Fairview Park. The first event was at 4 birds and the other four events miss-and-outs.

Events:	1 2 3 4 5	Events:	1 2 3 4 5
W Weideman	4 1 0 3 3	Cope	3 2 7 1 5
E Weideman	4 5 7 1 5	Drill	2 5 2 3 5
Johnson	4 4 8 3 5	Clegg	1 3 3 4 0
Steiner	3 4 2 5	Umstead	2 2
Tyson	3 1 3 4		

Owing to the scarcity of birds in the last event E. Weideman, Johnson, Steiner, Cope, Drill killed 5 straight and divided the purse.

Chadd's Ford, Pa., Feb. 17.—One of the most interesting shoots of the season was held by the Chadd's Ford Gun Club at their new grounds this afternoon, which was attended by a large number of crack shots from Wilmington, Oxford, West Chester, Hockessin and other places. Blue rock targets were used. The results follow. Each event was miss-and-out:

Events:	1 2 3 4 5 6	Events:	1 2 3 4 5 6
Steele	2 3 0 0 6	Beebe	0 0 0 0 0
E Malin	4 3 1 2	Pierson	9 0 0 0
Roser	3 2 2 2 4 1	Ritter	2 0 0 0
Brooke	3 4 1 0	Jordan	2 0 0 0
F Malin	2 1 3 1	Hunt	5 1
Alexander	4 6 6 4 2 11	Johnson	0 11
Henry	3 2 3 4 1 7	Huber	0 11
Sellers	0 7 6 1 3		

ARTHUR A. FINKE.

Hell Gate Gun Club.

FEB. 16.—To-day the Hell Gate Gun Club held its weekly live-bird shoot at Dexter Park. Former medal winners being barred, Moersch won on the shoot-off. The scores: H. Meyer 7, H. Leopold 9, Dr. Hudson 6, F. Sauter 4, J. Bantén 0, F. Kromberg 0, J. Meisterhatter 6, J. Moersch 7, P. Garms, Jr. 6, H. Neusch 2, J. Schlier 9, A. Lucas 5, J. Dannefelder 7, J. Wellbrock 6, J. Radley 3, C. Jacob 7.

Answers to Correspondents.

No notice taken of anonymous communications.

E. C., New York.—Will you kindly inform me under E. C. in your "Answers to Correspondents" whether European birds sometimes, while migrating or otherwise, accidentally lose their way to the shores of this country? If this occurs could you name me any of such birds? Ans. Yes, it is true of some land and many water birds. Of the first class Stoni chet skylark and wagtails are examples. Of the last, European woodcock, widgeon and teal.

C. A. L., Jamaica, N. Y.—1. Where and when do English snipe breed? 2. When do they appear on Long Island and New Jersey coasts? 3. When is the open season on Long Island and New Jersey? Ans. 1. They breed from the middle districts north to the British possessions in late May and early June, according to latitude. 2. They reach Long Island and New Jersey coasts on the northward migration in late March and early April, and on their return appear in numbers in September and October. 3. Open season for New Jersey: the months of March, April and September; open season for Long Island: July 1 to Dec. 31.

PUBLISHERS' DEPARTMENT.

Improved Service to Florida, East Coast, New York and Florida and Palm Beach Limited.

THE present season, now at its height, has been the most successful one the South has ever known.

The social summer life of Bar Harbor, Saratoga, Lenox and all the chief resort centers of the North, has been transferred to Florida, Aiken and Augusta.

The winter climatically is the most delightful one in many years at all of these places. Golf, shooting and fishing, bicycling and tennis rule the day, and concerts, entertainments and balls occupy the evenings.

On the East Coast of Florida surf bathing and bicycling upon the hard boulevard-like beaches are the popular diversions.

The New York and Florida Limited, "The Florida Short Line," the most magnificent train in the world, has been the greatest factor in making the Southern season successful, because it has made the journey itself a veritable delight. When the announcement of the New York and Florida Limited was first made public, it was heralded by the press through the length and breadth of the land as an illustration of the extreme limit which it was possible to reach, both as to speed and the refinements of travel. Many expressed the belief that the fast time advertised could not possibly be made. To cut down old established schedules from twelve to eighteen hours seemed impossible; to be able to lunch in New York one day and St. Augustine the next, preposterous.

And yet all of this has been done; not on a few special occasions, but regularly for several seasons by the New York and Florida Limited, and its remarkable time has been maintained with the regularity of clock work. Thousands of delighted passengers who have made the journey on this train de luxe between New York and Florida have realized that upon it traveling has been brought to a fine art.

Aiken, S. C., and Augusta, Ga., are most comfortably and quickly reached by the New York and Florida Limited, a through Pullman drawing-room car to and from these popular resorts being part of the equipment of this train.

Passengers leaving New York at 11:50 A. M. reach Aiken at 9:45 A. M., and Augusta at 10 A. M. the next day.

Jekyll Island and Brunswick, Ga. (the gem resorts of the Georgia coast), are reached by the New York and Florida Limited through its punctual service via Everett, Ga.

The New York and Florida Limited is operated jointly by the Pennsylvania Railroad, the Southern Railway, the Florida Central and Peninsular Railroad, and the Florida East Coast Railway. It leaves New York daily, except Sunday, at 11:50 A. M., and reaches St. Augustine at 2:20 the next day.

Palm Beach Limited leaves St. Augustine upon the arrival of the New York and Florida Limited, daily, except Sunday, reaching Palm Beach 10 P. M., composed exclusively of parlor cars. For further information call on or address Alex. S. Thweatt, East. Pass. Agt., 271 Broadway, New York.

Two other fast trains, the Washington and Southwestern Vestibule Limited, leaving New York at 4:20 P. M., and the United States Fast Mail at 12:05 A. M., are also operated by the same system. Each carries through Pullman drawing-room sleeping cars between New York, Jacksonville and Tampa. Also affording perfect sleeping car service between New York, Augusta, Aiken and Brunswick.—Adv.

Florida.

THE fastest service ever operated between New York and Florida is by the Atlantic Coast Line, working in connection with the Pennsylvania Railroad and Plant System. This is the eleventh season of the "New York and Florida Special" running via Richmond and Charleston. This vestibuled train, composed exclusively of Pullman vestibuled sleeping, dining, library and observation cars, steam heated and electric lighted throughout, will run daily, except Sunday, from New York and St. Augustine, taking also through Pullman cars between New York and Tampa Bay, making close connection to Brunswick and Thomsonville, Ga., and Palm Beach, Fla. The equipment embraces all the up-to-date improvements, and the trains are not only of the highest class, but run over perfect roadways, thus affording the patrons of the line faster time than ever before attained, and the most complete service that could possibly be had. The trains of the Atlantic Coast Line this season will leave New York morning, noon and night. To be exact, the hours are 9:20 A. M., 12:20 and 8:50 P. M. The "Florida Special" leaves at 12:20 noon, and will arrive at Jacksonville, Central time, 1:10 next afternoon, and St. Augustine 2:20 P. M. Passengers for Tampa Bay go through without change, leaving Jacksonville at 1:20 P. M., arriving at Tampa at 3 the same evening, making the run from New York to the Gulf in 32 hours. Passengers are due at Palm Beach at 10 P. M. This is the fastest time ever offered to the Florida East Coast and West Coast. The General Eastern office of the Atlantic Coast Line is at No. 229 Broadway, where all information can be had, and arrangements made for trips to Florida and Georgia, as well as to Aiken and other South Carolina resorts. This line offers the quickest service also to Havana, Nassau and Jamaica.—Adv.

Florida.

LAST TOUR OF THE SEASON VIA PENNSYLVANIA RAILROAD

THE last of the Pennsylvania Railroad personally-conducted tours to Jacksonville will leave New York and Philadelphia by special train of Pullman palace cars on Tuesday, March 8.

Round-trip tickets, valid to return on regular trains until May 31, 1898, and including railway transportation in each direction, and Pullman accommodations (one berth) and meals on special train going, will be sold at the following rates: New York \$50, Philadelphia \$48, Canandaigua \$52.85, Erie \$54.85, Wilkesbarre \$50.35, Pittsburg \$53, and at proportionate rates from other points.

For tickets, itineraries and full information apply to ticket agents; Tourist Agent, 1196 Broadway, New York; Thomas Purdy, Passenger Agent Long Branch District, 789 Broad street, Newark, N. J.; Thos. E. Watt, Passenger Agent Western District; Pittsburg, Pa.; or address Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—Adv.

A Handsome Medal Paper Cutter and Book Mark

Combined

SENT free of postage under sealed cover on receipt of 10 cents in silver or stamps. The latest, best and most serviceable adjunct of every library and office. Address Geo. H. Heafford, 410 Old Colony Building, Chicago, Ill.—Adv.

Brook Trout Stocking.

DURING the New England Sportsmen's Exposition Mr. C. C. Wood, superintendent of the Plymouth Rock Trout Co., will be at the Fishery Exhibit booth of the Association, where he will be glad to meet friends and give information about stocking waters with trout.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, MARCH 12, 1898.

VOL. L.—No. 11.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

I will lay aside my discourse of rivers and tell you some things of the monsters, or fish, call them what you will, that they breed and feed in them. Pliny the philosopher says, in the third chapter of his ninth book, that in the Indian Sea, the fish called balaena, or whirlpool, is so long and broad as to take up more in length and breadth than two acres of ground; and of other fish of two hundred cubics long; and that, in the River Ganges, there be eels of thirty feet long. He says there, that these monsters appear in the sea only when tempestuous winds oppose the torrents of waters falling from the rocks into it, and so turning what lay at the bottom to be seen on the water's top. And he says, that the people of Cadara, an island near this place, make the timber for their houses of those fish-bones. The Complete Angler.

SNAP SHOTS.

MR. McLAUGHLIN'S measure relative to the wearing of birds' plumes as articles of dress has been introduced in the New York Legislature again this winter. It is in line with the Massachusetts law enacted last year, but which proved inoperative because declared by the courts to be unconstitutional. The McLaughlin bill amends the section of the statute applying to wild birds other than game by adding this clause: "No person shall expose for sale, or have in his or her possession, or wear upon his or her person for the purpose of dress or ornament, the wings, feathers or plumage of any bird whose taking or killing is prohibited by this section." The excepted species are the English sparrow, crow, hawk, crane, raven, crow blackbird, common blackbird and kingfisher. The prescribed penalty is a fine of twenty-five dollars.

We print elsewhere a summary of the recommendations made by the New York State League for amendments of the game law. The League has profited by the experience of last year when its omnibus measure failed because of an unimportant provision respecting salt-water fishing, and has this year embodied its recommendations in separate bills, so that all may not be sacrificed to some one. As is rightly said by the committee, the most important amendment urged by the League is that providing for the repeal of Section 249, the iniquitous all-the-year game sale clause, which vitiates the force of the statute by keeping the great New York market open for the reception of game at all times. It is the duty of every good citizen of New York, who appreciates the importance of adequate game protection, to urge personally upon his Assemblyman and Senator at Albany the repeal of this section. The reason it remains in the law is found in the inactivity of sportsmen. How many gun clubs of the State have actually taken any steps to influence legislation at Albany on this question? Is it not a fact that if the larger part of our gun clubs and associations had taken up the campaign in earnest they would have secured their object?

We give in our shooting columns to-day an interesting and instructive examination of the constitutionality of non-resident shooting license laws. The paper is from the pen of a member of the New York bar who entered upon an examination of the North Dakota statute with the object of satisfying himself as to this phase of it. His conclusion is that the law would stand the test.

The non-resident license may now be considered as a permanently engraved feature of our game protective system; and it will in all probability come in time to be adopted by other States which because of their game supply attract visitors from outside. That the discrimination policy is a wise one has yet to be demonstrated. If the purpose of such legislation be to reduce the number of visiting sportsmen, that end is certainly gained; if it be to secure additional revenue, the attainment of

the purpose is at least questionable. More money may be carried into a State and left behind by visiting sportsmen where shooting is free than where a license fee is exacted. This is of course purely a subject of speculation; but the revenues derived from non-resident hunting licenses in States where the system is already in force make a paltry showing in comparison with the sums spent by visiting sportsmen for transportation, board, boats and guides; and it is human nature to spend more freely where there is not that sense of imposition which so many feel when they are called upon to lay down their money for shooting permits.

Maine is perhaps unique among the States in having laws coming down from early colonial days, and still in force, which operate to forbid the establishment of game preserves within her borders. The Massachusetts Bay Colonial Ordinance of 1641, as amended in 1647, declared that the right of free fishing and fowling for all in and upon any great pond lying in common and containing more than ten acres in extent, with the incidental right to "pass and repass on foot through any man's property for that end, so they trespass not upon any man's corn or meadow," that is, his improved land, "shall never be abridged." The court of last resort has held that this right thus secured has never been abridged, but is the law of Maine to-day; and further, that this law gives the right of free hunting for wild game on all unimproved lands, as well as free fishing and fowling in all great ponds, or ponds of more than ten acres in extent. While the game preserve might be independent of any great pond or right of access thereto, it must consist of "unimproved land," and so comes within the definition of territory declared open to the public for free hunting. Some years ago the matter was passed upon by the courts. A corporation owning a large neck of land containing thousands of acres, and surrounded on three sides by the ocean, fenced the third side, thus inclosing many deer, over which the members claimed to exercise exclusive dominion; but the courts held that this could not be done. In spite of the old law to the contrary, there are game preserves in Maine—the Megantic, for example. Here, however, control is secured not by inclosing the territory, but by the agency of the fire laws, which forbid the building of a camp-fire on a territory without the permission of the owner. To secure exclusive fire privileges—that is, exclusive camping privileges—on a tract of wild land is equivalent to holding it exclusively for whatever purpose may be desired.

At the recent convention of the Illinois Sportsmen's Association, a proposition was broached to prohibit by law absolutely cold storage of game; but when some one pointed out that such a prohibition would affect the sportsman as well as the game dealer, human nature asserted itself and the proposition was not urged. As one of our German contemporaries said the other day, if we had in this country the universal military service system, so that the war shouters would need take their own skins to market, there would be less shouting for a war with Spain. If cold storage could be forbidden the goose but permitted the gander, it would be in high favor.

While every effort should be made to discourage and prevent the cold storage of game for commercial purposes, work in this direction will have a substantial basis of reason and common sense if it be founded upon a determination to restrict a traffic in game which is unduly destructive of the stock. That is, in fact, the only reasonable contention upon which limitation may be put upon the sale of game. If the supply were so abundant that the market could be stocked the year around, a wise economy would encourage the killing of game for market and the perfection of refrigerating and cold storage methods. Since the supply falls short and cannot stand the drain upon it, cold storage is to be discouraged simply for checking destruction. To make a crusade against the practice of keeping game in ice chests, on the ground that refrigerated game is not good to eat, is as fantastic as the attempt made some years since to stop spring duck shooting by an alarm cry that ducks in the spring were infected with parasites which made their consumption as food a menace to health. Mankind had been eating spring ducks for thousands of years, and refused to be scared by the spring duck worm discovery. The world has been eating game birds, and domestic poultry and other meats kept in cold storage by the hundred thousand tons, and it is not now to be deprived

of its refrigerated market supplies by resolutions that such meats are not fit for human food.

We have said that the only sensible reason for limiting the traffic in refrigerated game is that same law of supply and demand which should forbid the sale of game at all seasons. It is a principle which applies to our present game conditions in America. In Great Britain the case is different. There game is provided by artificial breeding in such over-supply that dealing in refrigerated game birds is in many respects on a par with dealing in domestic poultry; and so refrigerating plants for the storage of surplus game are recognized as legitimate institutions. Here, for illustration, is an advertisement from a London shooting journal:

Game preserved by freezing for 12 months without suffering any depreciation.

The Leadenhall Market Cold Storage Company, Limited, freeze and store large or small quantities of game in their cold chambers for later sale, or consumption during the close season, at an inclusive charge of 3d. per head per calendar month.

Parcels of stored game sent to customers' or any other addresses on receipt of post card.

Example.—Say a sportsman stores 50 head of pheasants, and requires one or two brace for consumption or presentation. He forwards a post card or letter, giving the address to which he requires same to be sent, and they are despatched forthwith.

"J. S. Jones, U. S. A., Retired," writes from Bath, Me., to the Army and Navy Journal to relate a recent hunting exploit of Orderly Sergeant Richardson, U. S. A., of Fort Popham. The party of four hunters left Bath on Feb. 12 to go into camp in the upper part of the State. On the 15th Sergeant Richardson scouted to within long range of a band of five caribou, and in the presence of two companions as eye-witnesses distinguished himself by killing one of the caribou at 500yds., a second at 450yds., a third at 600yds., and a fourth at a distance unspecified, whereupon the fifth took to its heels and disappeared in the direction of Canada. This, relates the veracious Jones, U. S. A., Retired, "gave us four caribou out of five shots fired, and by only one man at that. We went into camp with flying colors, and were the center of attraction that evening." The summary of the hunt is tersely given, with due credit to the marksmanship of Richardson: "Our party were on this hunt for several days and killed six deer, two elk and four caribou, of which Sergeant Richardson killed four caribou, three deer and one elk, and he killed them all over 300yds., except one deer, which he shot on the run, and about 150yds. distance, breaking his neck." The Sergeant's rifle fire is so deadly to the game of Maine, we may well feel thankful that it operates only in a vivid imagination which stocks New England woods with elk and is unhampered by any knowledge of game close seasons.

The Sportsmen's Show given by the New England Sportsmen's Association will open in Mechanics Hall, Boston, next Monday, March 14. The projectors and managers have gone about their enterprise in the right way, and the affair promises to be notable for the wealth and variety of its attractions. It will be not merely a trade display of the equipments and appurtenances of the varied fields of sport of to-day, but a most effective exhibit of natural objects and woods life. Many thousands of dollars and weeks of planning and working have been devoted to providing special features which will gratify the sportsman's tastes. There will be on exhibition numerous specimens of game, large and small, drawn from the Corbin preserve and elsewhere; fishes from the United States Commission at Washington; Indian camps; a miniature lake, with boats and canoes; and in short, a realistic bit of the wilderness transported as by magic and set down in the midst of Boston. The Exposition will extend through two weeks, March 14 to 26.

A game case which found its way into a justice's court in Orleans county, N. Y., last week, had to do with the ownership of game when killed. A fox-hunting party had pursued a fox several miles, when finally it was killed by their hounds on a farm; and when the hunters came up they found that the game had been seized by the farmer owning the land. They laid claim to it, on the ground that it had been pursued by them and killed by their dogs. The farmer resisted on the score that it had been killed on his land. The hunters brought suit to recover the value of the fox, and the jury found for the plaintiffs, declaring that to the hunter belongs the game which he or his dogs killed or disabled.

The Sportsman Tourist.

Just About a Boy.—VII.

WHEN the snow banks had disappeared and the pussy willows were covered with little balls of bloom that looked strangely like white caterpillars, I met the boy on the way down town one morning.

"Hello! Say, gee! the spickerls (wall-eyed pike) 'r' runnin', 'n' we c'n have a picnic. Less go 'n' git the fishin' tackle 'n' have some fun, will yeh?"

He was all excitement, and eager to wet a line, after being kept away from fish by the ice of the winter.

"Are you sure they will bite this early?" I asked.

"Sure! I was juss down by the dam, 'n' the water is all cleared up again, 'n' I saw a whole lot of 'em right at the east end. They wasn't suckers er redhorse er buffalo, neither; they was juss spickerls, 'n' lots of 'em. Say, we c'n have more fun 'n a box o' monkeys—some ole Balaams 'mongst 'em, too. C'm on 'n' git yer line, 'n' I'll hustle the minnies, 'n' we'll sure git 'em!"

"All right, we'll go," I answered, for I was just as ready for a go at the pike-perch as he was, and if they bit at all I knew we would have good sport and get a mess of fine fresh fish—a welcome addition to the larder when you catch and dress them yourself, too.

"I'll meet yeh at the dam," said the boy as he started for his outfit in a regular boy hurry; and you know the busy man can never "get such a hustle" into his gait as an enthusiastic youth can communicate to his.

Shortly afterward I found him wading in the swirls that threatened to engulf his long rubber boots, working like a beaver to seine the needed bait. Minnows were scarce, but he soon had a couple of dozen in the bucket, and we clambered over the flume, white with the flour dust that sifted down from the rumbling mill on the bank.

"Now take yer line 'n' put juss a little bit o' sinker on 'bout 3ft. from the hook; nen hook yer minnie soss he hangs straight 'n' nice, like he was alive," said the boy.

"Yeh see," he continued, "the swirls 'n' eddies down there 'll keep him a-wigglin' 'round like he was swimmin', 'n' when ol' Mr. Spickerl sees him he juss opens that mouth o' his, 'n' down goes yer bait, hook 'n' all. This time o' year they ain't quite so lively as they are 'long about June, 'n' they kind o' swim away slow 'n' don't get hooked right at first, so yeh don't want to be too quick 'n' pull it away from 'em. When yeh see yer line begin to move crost the current kind o' stiddy, juss let him go 'n' give him plenty o' time, nen jerk kind o'—er don't jerk at all; juss give him kind o' a pull, soss to sock the hook into his mouth solid. If yeh jerk quick yer liable to jerk it away 'n' not git him, see?"

We had baited and cast into the boiling eddies under the fall of the dam, and sat down on the stone pier waiting. A strong, fresh wind came up out of the south, bringing the perfume of the willow catkins, the bursting cottonwood buds, and that earthy smell of spring when the old world wakes up again.

The day was bright and warm; robins and bluebirds crossed the sky at intervals, bound north, or just house hunting there by the peaceful stream. The dull roar of the falling flood filled the air and sung a monotonous chant that somehow goes well with fishing.

"You got one!" said the boy.

My line was moving out steadily across the foam-flecked current, and I let it go 40 or 50ft., then struck as I would for bass. Instantly the line tightened and began to sing through the swift water as the reel screamed and the rod bowed to the strain.

"I got one too!" was the boy's next remark, as he scrambled down on the top of the dam, so we would not foul each other. I was too busy to watch the boy, and he had landed his with a long-handled net before I got mine where he couldn't fight. When I brought him to the top the boy landed him for me, and we had a pair each of about 4½lbs.

"Gee! this is the right kind," said the boy as he baited again and cast for another chance in the river lottery. One by one they struck and fought a vain fight until our string grew long and heavy, while the boy's eyes shone and a healthy outdoor flush tinted his beardless face—enjoyment personified, if I ever saw it.

Several 5 and 6-pounders had been vanquished, and we were thinking of going home, when the boy struck again and then yelled: "Gee! I've got a whale!"

Sure enough, his rod was see-sawing furiously, and the reel screamed above the roar of the flood as his fish rushed into the current and far out into the river, in spite of the drag.

The boy fought him coolly enough until the great fish leaped out of the water a hundred feet away, giving us a momentary glimpse of what the boy called the "daddy of all the spickerls," and then became so excited that he stepped too near the edge of the dam and went over the plank "apron" that pitched, moss covered and slimy, to the river below.

Luckily the water only trickled over the top just here, and was only about waist deep below. Almost before the water that flew up as he dropped in had reached its level the boy bobbed up, scrambled to his feet and began reeling in his line as he stood there, waist deep in the cold water, dripping, shivering, but full of fight and anxious to get his fish.

When he found he still had his fish hooked he let out a yell and scrambled up on a little rocky shelf that jutted out from the pier foundation, and then got down to the business of fighting that big pike.

Time and again he got him up only to have him rush away at a speed that threatened wreck for the rod, reel and line. The boy said nothing, but fought like a general, eyes and hands working together in cool precision that was a joy to the onlooker.

I had climbed down the niches in the stone pier, and stood ready with the net as soon as the fish should come within reach. Several times I saw him rush through the water under me, and each time his dark length seemed longer, and I began to think he would surely get away, just because he was the "big one."

At last he came within reach, broke water and lashed

out with his broad tail in two or three exhausted, weak splashes; the net shot under and raised him, a gasping captive, still snapping his fanged jaws and flashing fight from his big eyes.

Then the boy went wild. "Yip, yip, hooray! Gee! yip! yip!" he said, dancing around in the deeper water, where he had slipped in his excitement, and gone under again with a gurgle as he disappeared.

He forgot about the cold, about being soaked, about everything except his fish, and I had to talk to him five minutes before he understood that he would have to wade around the flume and carry the fish that way while I brought the rest over the flume.

When we got together on the bank we voted unanimously that this fish was a sure whale, and that we had enough. Rods were quickly unjointed and packed, and then we went up town to hunt a pair of scales.

Sixteen pounds strong was the verdict, and the fish looked half as much more. No one in town had ever heard of one as large being caught in the stream, and I believe it is the record fish yet in this Western river, for times are changing, and fish growing smaller there each year.

This stream waters one continuous farm now from source to mouth, and the black soil has made a slimy, muddy bottom and a murky flood where only suckers and bullheads dwell, instead of the clear, swift-flowing river that was there babbling along over its rocky bed when the boy caught the "daddy of all the spickerls."

EL COMANCHO.

Camp of Two Cranks.

White Water River, Indiana.

My friend Tom Smarr is a 33d degree fish crank. I am in the same category. Tom would rather fish than eat. I am afflicted much in the same way. Tom is never happier than when poking along a stream hunting for a deep hole or an enticing sheet of water below a riffle that looks "bassy." "Me too."

The similarity might end there except for some trifling details, for Tom is a youngish sort of fellow, struggling with a widely scattered, pin-feather moustache that keeps him in a perennial state of great expectations. But Tom is a most excellent companion to be out with; as good as ever flipped a flapjack in a fryin' pan, waded a stream for minnows where the ice had to be broken to use the seine; or sat on a soft rock for three hours without getting a nibble. Tom has done all this, and would do it over again if the occasion warranted. Tom has been my Sunday partner in a good many one-day trips for bass in the fall during the past four or five years, after my annual to the North Woods of Michigan or Wisconsin was over, and we have usually kept it up till the lines would freeze to our rods, and then reluctantly put them away till the dogwoods bloomed in the spring.

The streams usually fished have been the big and little Miamis, the East Fork, Stone Lick, Seven-Mile Creek and the White Water, none of the trips taking us more than an hour's ride by rail from the city, except Seven-Mile, and we have spent many a pleasant day together and caught "quite a few" bass, as they say in Michigan; however, on some days one would get nothing on account of the waters being too high or muddy and, on other some days, with the water and other conditions perfect from an angler's point of view, the bass wouldn't respond to the most persistent coaxing and enticing baits and lures at our command; the reason for which no man has ever found out, and "I don't believe no man never will find out"—a chunk o' grammar borrowed from my friend Jim M., who "don't believe in hifalutin' airs when yer speakin' plain English."

But it made no difference whether the fish bit or not; it was good to be along the stream and in the woods anyhow. If we got caught in a rainstorm and caught a soaking we made the best of it, and on all occasions and in all weathers Tom has been cheerful and light of heart; ready to wade to his neck if necessary for minnows, and has always done his level best to make things pleasant on our various trips.

All this is why I like Tom, and is a sort of preliminary to a "really camp" we had together last October, "jest Tom an' me."

After returning from the "annual" last August I was given a hint by an old angling friend about some very good bass fishing to be had in the East Branch of the White Water River, near Brownsville, Union county, Indiana, fifty-nine miles from Cincinnati, and he advised me to take a day or two off and go up and try it. I told Tom about it, and he said, with a solemn and serious expression, "Hickory, let's take it in." I was willin' as usual, but as we thought it a little early for good fall fishing we concluded to wait three or four weeks and go up for a few days about the first or second week in October. Meantime we planned for the trip and indulged in much fish talk and expectations.

I made a new mess box in which to pack a couple of fryin' pans, a camp kettle, coffee pot, tin plates, pans, cups, knives and forks, spoons, etc.—these from my old North Woods outfit—with room for provisions enough to last us four or five days, the time agreed on for our stay on the stream.

Then when the time drew near I packed one of the big canvas bags with bedding, the old slicker suit, a pair of rubber boots and one of the tents, tied an axe on the tent poles and waited for the day to start. Meantime Tom and I talked some more about fish. I had written to the proprietor of the Commercial Hotel at Brownsville about a conveyance to take us up the river a couple of miles to where we wanted to make our camp, and everything was arranged to our pleasement, even to a bucket of good minnows that he would have caught for us for a starter.

Oct. 5 we took the 9 P. M. train on the C., H. & D. railway and were at Hamilton, twenty-five miles out, before we were fairly settled down for a smoke and a trifle of fish talk to keep us from getting drowsy.

From Hamilton to Indianapolis the C., H. & D. boasts the best piece of railway track in the country—so conceded by railroad men—and we slipped along so "slick an' easy" that the brakeman called "Brownsville!" before we knew where we were at.

On the platform we ran against a man who was waiting to pilot us to the hotel, where we were to stop for the rest of the night, and drive up the river early in the morning.

We stored the "calamities" in the station baggage room and followed our guide Bill M.—man of all work about the hotel—across the track and down the street a few rods, and were ushered in and upstairs into a room 8x12 for the rest of the night, albeit we didn't get any rest to speak of. The room was furnished sparingly, only a bed, a wash-stand, a couple of chairs and a strip of carpet in front of the bed; but everything was clean and neat-looking, and we undressed and turned in for a good sleep and rest, but somehow we missed the combination.

The "ingredients" of that bed were past finding out, but Tom and I made a guess that the foundation of it was a cast-iron slab, then a half-inch shuck mattress, a feather tick with about as many feathers in it as there were hairs in Tom's moustache, and last topped off with a quilt and a clean white counterpane.

We may have been wrong in our "diagnosis," but it was as near as we could figure it out without ripping it all up for a more critical examination. And if we were in error about the aforesaid bed we stand ready to apologize and take it all back. Anyhow, we didn't sleep an hour for turning over, first on one side and then on t'other, trying to find a soft place in that tick or mattress or slab, as the case might be—and cussin', for it was a case that called for some of the most scientific profanity. But all things come to him who waits, and Tom and I were waiting for daylight. It came at last, and we dressed and went down stairs and out to get our bearings and limber our j'int's a little before breakfast. This came also at last, and was so much better than we expected that we set it down as a sort of balance to offset the bed, and called it square.

The landlord, Mr. Harvey, and his estimable wife treated us with regular old-fashioned hospitality, and if they will only add a few more feathers to that bed—if we go up again next fall—we'll "hooray" for the Commercial till we're hoarse.

Every village near a stream or lake has its oracle—its Izaak Walton, so to speak—and the Brownsville oracle showed up while we were waiting on the corner for Bill to come around with the conveyance, and the yarns he told us about the big bass that he had taken out of that stream nearly caused Tom to do a turn at standing on his head. He had evidently known of our coming, and was "loaded an' a-layin' for us." He seemed to be a well-informed, intelligent talker on fishing, and doubtless knew every foot of water for miles up and down the stream, and as Bill told us afterward was the best fisherman in town.

We are more or less susceptible to the blandishments of the average oracle, mayhap, and I always make it a point to listen to and believe all they say if I can; but Tom seemed at last to have some doubts about the exact dovetailing of some of his yarns, and made a sign to me "onbeknownst" to the oracle, which read plainly, "He's talkin' for a drink."

"Now," continued Izaak, "the fishin' is better down stream to'ards Quakertown than it is up to'ards Yankeetown, but as your idee is to camp up above to'ards Yankeetown, I'll tell ye where there's a good place, an' maybe I'll come up to-morrer an' see how yer gettin' along."

We invited him to drop in on us at any time that suited his convenience, and this gave him a fresh start, but just as he got the place mapped out the appearance of Bill cut us off from a whole lot more valuable information, and we left him standing on the pavement looking "drier'n a fish," Tom saying as we got out of earshot, "What a pity we haven't a bottle; that old fellow's so dry he can't tell the truth."

Bill had a light little spring wagon, to which was hitched a finely built bay mare, "a thoroughbred and a goer," as Tom declared, "and just sweet enough to hug." (Tom's a Kentuckian, and of course has an eye on good horses.)

We waited a few minutes while Bill went down to the river a few rods away and brought up a big bucketful of minnows that he had seined with a piece of mosquito bar out of a small stream near town the day before, and driving over to the station and loading the outfit we were off up to'ards Yankeetown at a clip that proved the correctness of Tom's estimate of the little mare—Daisy, Bill called her.

After getting clear of the village, Bill let her out to show us her pace, and the way we "swapped saplin's" along the base of the hill for the next mile was a caution to the "Mackinaw flyer" on the C., H. & D. to look for a new record. The pike was hard and dusty, and as the little mare warmed to her work we left a streak of stirred-up dust that could be traced as far back as we could see the road. Once Daisy shied a little at something at the side of the road and broke the steady swing of her trot, and Bill had quite an argument to get her down to work again. "Hi, there, Dais'," he said in a quiet tone; "what's the matter of ye? Want to run off ag'in, do ye? Whoa, thar, come down out o' that foolishness an' git into yer gait. Stiddy, gal, Bill's at the lines, an' ye know Bill." And as Dais' settled to her work again under Bill's skillful handling and quiet talk he said, "My! but ain't she a clipper? But the little heifer 'll run off at the drop of a hat 'less'n she knows who 's got a holt o' the lines."

"Run off with a dude sort of a chap a week er so ago—that feller didn't have sense enough to drive cows—an' like to 'a' broke his neck, an' pity she didn't—stiddy, Dais, gal; don't git too gay so airy in the mornin'!"—as the mare showed a disposition to break again.

"Ye see," turning slightly to me, but keeping an eye on Daisy, "I take care o' Dais' an' feed 'er all the hoss nicknacks I kin git holt of, an' pet 'er an' talk to 'er an' we understand each other, an' she never wants to run off with Bill. Nothin' like knowin' yer hoss, an' nothin' like yer hoss knowin' you; come, Dais', don't let the grass git to sproutin' under yer feet," and with such quaint and kindly talk Bill beguiled the way, and it was a pleasure to listen to him, for his heart was in it, and the little mare seemed to understand it all.

We stopped about a mile and a half above town, at the Riggles (I am not sure of the spelling of the name) farm, and tying Daisy to the fence took our way through

PRONGHORN ANTELOPE.

From a Drawing for the FOREST AND STREAM by Carl Rungius.

a field of tall corn in the river bottom for a hundred yards to the stream to look at a place the oracle had spoken of, and which Bill also said was a good place to camp, and "right by a mighty good fishin' hole."

Tom and I looked it all over, and were well pleased with the place, albeit the water was low on the riffles and too roily and milky to promise good bass fishing. There had been no rain around there for weeks, Bill said, and the water seemed to have become thick and muddy looking, and needed a good rain to clean out the stream.

Thinking that we might find a place further up that would suit us better, we got back in the wagon and drove on nearly a mile further and then forded the stream at a riffle to look at another spot Bill recommended.

It didn't remind us of anything, however, and we drove another half mile, crossed back and came through Yankeetown—three or four houses and a big flouring mill—without seeing any holes that suited us as well as the one first looked at.

We went back and carried the outfit through the cornfield to the spot we had first taken a notion to just beyond the corn rows near the edge of a bank 8 or 10 ft. high, overlooking the water, where there were trees and bushes enough to afford a good shade. While Tom and I put up the tent, Bill took a stout cord that I had brought along for just such a "want" and went up to the farmhouse on top of the hill thirty rods or so from the stream and 100 ft. or more higher than the camp, and brought down a great back load of clean straw, with which we made a bed that would knock the spots off the one we had tried to sleep on the night before. First a layer of straw 2 or 3 in. deep; spread over this the big rubber piano cover; then straw a foot deep on top of it; then a light cotton mattress, blankets and a

big comfort, and we had a bed that, as Tom said, "was good enough for a dog."

We made a table under two trees near the bank by matching together a tongued and grooved box lid 4 ft. square that I had brought along for another "want," driving four posts in the ground for legs, and while I put the finishing touches on it, Tom got together a lot of flat stones, with which the bank was lined, and made a fireplace 3 or 4 ft. from the edge of the bank, on which were placed the two $\frac{5}{8}$ in. square iron bars, 4 ft. long, that had done service in many a camp in the North Woods of Michigan in days gone by.

Our camp was made and we felt as proud of it as two schoolboys with a new sled.

Bill had left for town before we were done camp making, borrowing my little minnow seine with a promise that he would go up the creek about three miles that afternoon and "ketch a bucketful o' bully chubs," and bring them up next morning. By the time the camp was finished it was past noon and we were as hungry as a yaller stray dog.

Tom made a fire in the new fireplace and put the kettle on, while I took a tin bucket and went up to the farmhouse after milk for our coffee and some eggs to put an edge on the bacon. While Mrs. Riggles was getting the milk I struck up an acquaintance with her baby, a chubby nine months old, good-natured youngster, and we had a great romp together, and I got my hair and ears well pulled during the festivities. The friendship ripened rapidly, and we had a heap o' fun together every time I went up to the house for milk, eggs and other produce that we needed at the camp.

I took a great notion to the "boss o' the ranch"—he was their only child—and I trust that as he grows up he will develop a hankerin' after "goin' a-fishin'," for

it has always seemed to me that a boy who takes a notion to a fishing rod and a gun is somehow a better sort of a boy than the one who don't.

Back at the camp I found Tom with the dinner well along (among Tom's other good points he's a first-rate camp cook), and soon after we sat down to our new table on a couple of camp stools—brought along because the evening camp-fire never seems to burn just right without a camp stool to sit on—and figuratively cleaned the platter, and Tom had to fry another course of eggs and bacon, which we "let on" was the dessert—cake, pie, puddin', ice cream, an' sich.

We were too eager to get to fishing to waste time washing the dishes, but we promised them a good cleaning up before they would be wanted for supper.

I don't hold this up as a good example to pattern after in a camp, but sometimes the exigencies of a case warrant a "suspension of the rules," and this appeared to us to be a case with a whole lot of exigencies in it.

The rods were taken out of the case and put together carefully, and with a deliberation taught by years of practice and experience. It is a good rule, and time well spent, to put your rod together carefully and accurately; joints snugly fitted, and guides in line. This may apply to the veterans as well as to the youngsters of the gentle art.

Ten yards or so above the table the stream made almost a square elbow, and 100 yds. above the elbow was the tail end of a long riffle. Forty or fifty yards below the camp the stream was split by a very small grassy island, on each side of which was a few yards of quick water, and below that a strip of quiet, deep water for 200 yds. or more to another square elbow in the stream that led to the left and on down past the town.

At this elbow the stream was 25 to 30 yds. wide, and

from 5 to 15 ft. deep—a mighty promising looking place for fall bass fishing. Just above the camp was a long crib of heavy timbers filled in with rock—"ripraps," Bill called it—to keep the water from eating away the bank when there was a flood in the river.

From the tail of the riffle above, along past the rip-raps and the camp, down to the little island, the water was from 2 to 10 ft. deep, and was a very "bassy" looking piece of water had it been clearer.

Tom chose the rip-raps from which to make his first cast, and I went down along a path through the bushes to another crib of stone at a slight kink in the stream, a matter of 100 yds. below the camp.

The river bottom in this bend was as nature made it, except for the long field of corn between the camp and the road along the base of the hill. The bank of the stream from the camp down around and below the elbow was lined with willows, bushes and trees, some of them gigantic sycamores, with the natural woods reaching back to the cornfield. On the west side, where the stream made the turn, were well wooded hills, along which we frequently heard the barking of squirrels, which stirred up memories of boyhood days, and made us sorter wish for a gun. Altogether it was a very satisfyin' place for a camp, lacking only a good spring to make our cup of happiness run over, albeit we got periodical whiffs of a pestiferous skunk, whose whereabouts we couldn't locate, but which seemed to be within "smell" most of the time. Barring these two drawbacks and the muddy condition of the water, we had nothing to wish for to make our little camp more perfectly enjoyable.

But then we can't always have just what we want; if we could there would be nothing to growl at.

I fished the lower rip-raps for an hour and got nothing, and went on down fishing, when I could get to the stream for the bushes, to the bend below, but still got no sign of a bite.

This was a trifle discouraging, and I went back to the crib and sat down on the soft side of a flat, ragged stone near the water and fished patiently till the sun dropped below the top of the hill across the stream below, and then made my way back to camp with one bass that would weigh probably a pound and a half—poor satisfaction for the afternoon's fishing, if satisfaction were measured by the number of fish taken—but that one looked like a good many to me, considering the condition of the water.

Tom was still fishing along the rip-raps above the camp, and when I told him of my catch I could see him "hump himself" with a suppressed chuckle, and I knew he was quietly laughing way down in his socks at the idea of "layin' old Hickory out," for he triumphantly held up his stringer, on which were four bass and a channel cat that would run from 1 lb. to 1½ lbs. in weight.

Five bass and a cat made rather a poor showing for an afternoon's work of two old bass fishers, notably my part of the showing, but—"it is not all of fishing to fish," blessed be the memory of brother Dawson for the utterance of that truth.

Tom quit fishing and started a fire for supper preparations, and I made another trip up the hill road to the farmhouse for some fresh milk and another "rastle" with the "boss o' the ranch."

We kept our promise and washed the dishes before supper and after, and then built a camp-fire and sat in front of it and smoked and planned for the morrow till it was time to try our new bed, and, oh, my! that bed! it was so restful and full o' solid comfort that I don't think either of us turned over once till daylight was abroad.

KINGFISHER.

[TO BE CONCLUDED.]

Natural History.

An Animal Portrait Painter.

The spirited antelope head which looks out from the page is the work of Mr. Carl Rungius, a young German artist, whose work is more or less familiar to our readers.

Carl Rungius was born at Berlin in 1869, and is the son of a clergyman, who wished his son to follow the same profession. He was educated in a Latin school in Berlin, but at the age of eighteen determined that he would become an artist, and left school. In order to get a practical knowledge of large work and its effects he engaged himself with a fresco painter in Berlin, and worked during the summer in the buildings there, devoting the winter months to study at the Industrial Art School of Berlin. After some time at this he began sketching animals in the Zoological Gardens at Berlin, and continued this work for a year. The sketches made during this time having been shown to Prof. Meyerheim, a prominent German animal painter, he at once took Rungius into his class at the Academy of Fine Arts. Here the young man worked for a year, and at the end of that time was honored with a diploma of proficiency.

The first work that he exhibited was a lion's head shown at the great Berlin Art Exhibition in 1893. The head was much admired, and was reproduced in certain of the art monthlies. After this Mr. Rungius served his year in the army, and during his term of service was promoted to officer's rank.

The summer of 1894 Mr. Rungius accepted an invitation from an uncle residing in Brooklyn, and came to America. Before he had been here long he recognized that there was in this country a great field for animal study, as well as for big game hunting. In the autumn of 1894 he visited the Maine wilderness, hunting and sketching, and became very enthusiastic about the possibilities of wild life here. In 1895, at the Sportsmen's Show, he formed the acquaintance of Ira Dodge, well known as a Wyoming guide and mountaineer, and spent four months of the following summer and autumn at Dodge's place in Wyoming. From this visit he returned in November with many sketches and trophies of his trip, all of which he carried back to his home in Berlin in 1896, where he at once set about working up the material he had gathered. Here he met Richard

Friese and a number of other well-known animal painters. His association with them was not only pleasant, but undoubtedly very useful.

Several of his paintings and studies of scenes in the further West he sold at Berlin, but the attractions of America were too strong to allow him to remain in Europe, and in 1897 he returned to New York. He at once set about preparing for another and more extended trip to Wyoming, and spent a great part of last summer and autumn in the less known mountain ranges, whence he brought home in the late fall another good series of heads and sketches. During this trip he gave great attention to observing antelope and elk, and brought back a very large number of studies of these two species, both in pencil and oil.

Mr. Rungius is a keen and painstaking observer of nature, and has learned a great deal about the life of many species of our big game. Besides this he is a good and untiring sportsman, while his industry and his artistic skill with the brush are not to be doubted. The hand that knows how to pull the trigger at the right moment can wield the brush at home with equal dexterity.

East African Mammals.

BY D. G. ELLIOT, F.R.S.E.

It is well remembered that in 1896 the Field Columbian Museum sent out to East Africa an expedition under the charge of Mr. D. G. Elliot to collect examples of the large wild animals of Africa. This expedition was remarkably successful, and as we have before stated, obtained a large series of very many of the species inhabiting the country which it traversed. Besides these specimens there were brought back as well photographs, casts of heads and muscles and full measurements of the specimens obtained. The proposed expedition was to penetrate deep into the interior, but the illness of the members caused it to fall short of accomplishing this purpose, and for this reason the list of species is not absolutely complete.

Through the kindness of the Director of the Field Columbian Museum, and the leader of the expedition, who made a full report to the museum, we are permitted to publish the following notes on some of the more striking species obtained.

WART HOG (*Phacochoerus africanus*); NATIVE NAME, *Dofar*.

The wart hog was frequently met with throughout the country traveled by us. The first one seen was at Mandera, near the base of the Golis Range—a splendid boar with tushes over 10 in. long outside the mouth, and 10 in. across from tip to tip. He had seen me and sought refuge in an almost impenetrable thicket of thorn bushes. I took a position on one side, and sending the men into the bushes from the other, drove him out. He presented a grand appearance as he came, trotting majestically along, without the slightest evidence of fear, his tail held upright with the tassel pendent forward, and his mane, very long and thick, raised above the neck and back. He passed within 6 ft. of where I stood, and only the click of the hammer answered the pull of the trigger as I threw the muzzle of my rifle toward him. My shikari had forgotten to throw a shell into the chamber before handing me the weapon. Of course the hog disappeared at once among the bushes, and we were obliged to track him a long way before I got a snap shot at him about 100 yds. off, and broke his back. He was the personification of rage when I walked up to him, champing his tushes until the foam flew from his mouth, as he made frantic but unavailing efforts to reach me. Another bullet laid him lifeless.

We always seemed to see these pigs when they were running, and never when going quietly about their business, the very open condition of the country generally permitting them to see us before we could them. They appeared to be somewhat independent of water, for we met them in the middle of the Haud where certainly the nearest water hole must have been fifty miles away, too far, one might suppose, for them to seek daily. The wart hog is a fine-looking animal for a pig, the long mane and rather majestic carriage of the body, especially in the full-grown males, adding greatly to their appearance. They have the courage of their race, and a wounded wart hog at close quarters would be a dangerous antagonist, as he could inflict fearful injuries with his formidable tushes. It is the only species found in this part of eastern Africa. It obtains its trivial name from the peculiar wart-like excrescences upon various parts of the head. These are very prominent and usually pointed, and produce a very peculiar effect, not, however, one of beauty. The natives being Mussulmans will not touch a hog or anything that has come in contact with one, so the European who desires to preserve one of these animals, either as a trophy or for scientific purposes, must do all the work himself, while his followers squat around him, criticise his skill or the lack of it, and make comments about him generally. When the members of a litter arrive at an age between one and two years they leave the parents and shift for themselves; at least this I imagine to be the case, for young pigs that I saw, and some of which I killed, roaming about without any adults near, and apparently quite independent of a parent's watchfulness and care, were at least over a year old. It is difficult to estimate the number of young usually found in a litter, but I should suppose from four to eight would be nearly correct. Many fall victims to carnivorous beasts, leopards being especially fond of pork, so that the species is kept from undue increase.

SWAYNE'S HARTEBEEST (*Bubalis swaynei*); NATIVE NAME, *Sig*.

This rare antelope, to obtain which I made a special trip to Toyo Plain, is only found in a few localities on the elevated plateau south of the Golis Range and north of Ogaden. It dwells in the open, grassy plains, such as those of Toyo, Silo and Marar Prairie, and is never found among bushes, but keeps to the bare country where its vision is uninterrupted by any object, trusting to its great swiftness to carry it beyond the reach of its enemies. This hartebeest goes in troupes and herds from a half dozen to many hundred individuals. On

the plains inhabited by these animals the bushes are rarely over 2 ft. high, and very few in any place, so that stalking, in the usual acceptance of the term, is practically an impossibility, as the hartebeest see the hunter much more quickly than they themselves are observed. Generally they are first sighted along the horizon line of the plain, looking like black spots in the distance, but recognizable from their peculiar shape. It is an ungraceful creature both in appearance and in action when in motion. The hindquarters are lower than the withers, and the animals seem always to be standing up hill. But while it moves away in a lumbering kind of canter, it possesses the greatest staying power and is really the swiftest of all the antelopes, always graduating its pace to that of its pursuer, and keeping the same distance between them, looking back occasionally as if to satisfy itself that its enemy had gained nothing in the chase. Single bulls are approached most easily, but the larger the herd the more difficult it is to get near them, as the courage of the entire number is only equal to that of the most timid, and as soon as one begins to run all are off at once. When one is seen in the distance on the plain the hunter walks toward them in a direct line if they are busy feeding or moving slowly away, but should they stop to look around them the pursuers take a slanting direction as if intending to pass them or had not seen them. Sometimes, when almost near enough to try a shot, they begin to run in their rather slow, clumsy-looking canter, but which is not usually kept up for any great distance, when they stop and turn to look back. Where this happens, and it usually does many times before the quarry is secured, or runs away altogether, the hunter has all his work to do over again. It is therefore only by exercise of much patience and considerable staying powers a sufficiently near approach is gained for a fairly certain shot, anywhere between 200 and 400 yds.; nearer than the first can seldom be secured, and frequently the latter is exceeded. An animal, wounded not in a vital part, or with one leg broken, will often run clear out of sight and escape, and it is practically useless to follow such a one, as it rarely permits a favorable opportunity for a second shot. On the plains it inhabits there is no water, save what may occasionally fall in showers during the brief so-called rainy season, and this antelope must go practically without drinking, at all events for long periods. Those we killed were in excellent condition, but like all the ruminants of the country, possessed no fat whatever. Swayne's hartebeest cannot be considered a game animal; there is very little sport or excitement in its pursuit, and if I had not needed specimens for scientific purposes, after killing one I should not have cared to shoot a second. The "Sig" stands between 4 and 5 ft. high at the withers. Both sexes possess horns, and these vary according to age both in the extent and manner of curvature. Some horns of bulls measure over 23 in. from tip to tip, but the majority is much below this. The flesh is dry and on account of the absence of fat is only fairly palatable.

[TO BE CONTINUED.]

Taxidermy and Sculpture.

Editor Forest and Stream:

Under the above title there appears in a recent issue of this journal a peculiar article, which is full of very loose misstatements. Its writer tells us that "it was only a few years ago that some of the most enlightened taxidermists began to use a form of excelsior." Now, its common use began at least fifteen years ago, in special cases much earlier. "Then [that means after] some one suggested the idea of covering that manikin with a thin coat of papier maché or wet clay," etc. Many persons have positive knowledge that clay was used over thirty years ago, but of course our friend knows nothing of that. He goes on to tell us: "For this reason the very best of their specimens were void of form save for a few outlines and for their attitudes, which were often correct." "Void of form," then "correct," is good. Our gentle critic tells us of a "great drawback to the use of wet clay manikins," namely, "the bursting of the skin caused by the clay being next to the skin and continually absorbing the animal matter out of the skin. After a while this dries and burns the skin," etc. I understand by this that the bursting is caused by the absorption of animal matter (he does not tell us what animal matter) by the clay, and that the burning takes place afterward; that is, after the animal matter is absorbed! What other meaning can it have? Now, burning of a skin is caused by the oxidation of the fat left in the skin; but of course this writer knows nothing of such a common, simple thing as this. "Burnt skins" are common, but they rarely come in contact with clay. Besides, what absorption of animal matter by clay can take place that is not equally traceable to the drying powers of the air? I can confidently assert that clay is not the cause of a skin cracking or opening down a seam. The abuse of clay and its unskillful use undoubtedly cause trouble, but this does not often occur.

Now our friend makes no distinction in his approval of the method he mentions between mounting a long-haired animal and a short-haired one. Undoubtedly a plastic method with fineness of modeling is exceedingly useful for the latter case; but thinking of the artist wasting his time and energies when 4 in. of hair hides his fine details! What use would it be? But he makes no distinction. There are in the National Museum many mammals mounted on clay manikins; yet, except in one case, there is no sign of bursting. The exception was not due to clay. Hornaday's zebra, elephant, tiger and others are unchanged; they are as they were when they left the artist's hands. The extravagant language of our writer is only too evident when he tells us he is "greatly handicapped by a skin." The form of a horse he illustrates is not taxidermy; it is sculpture; the mane and tail prove this, for such things belong to the skin, not to the manikin or model.

It is the rule in taxidermy that skins reach the taxidermist's hands rough, with few or no measurements, perhaps no bones, no photographs, no notes. Perhaps there is no good picture extant; or if so, how often is it accessible to the individual who most needs it? It

is no extravagance to state that 90 per cent. of all skins mounted are in the condition given above; yet these facts play no part in our writer's scheme. Moreover, the taxidermist has to produce quantity under influences almost entirely to his disadvantage; he knows little of the anatomy; he can know but little of the animal whose skin he is working on; he has little time to learn; perhaps he cannot. The average taxidermist works under a very great disadvantage, but he generally satisfies the capabilities of his employer's pocketbook, and if his employer wants a finely modeled result, and is willing to pay the price, he can always get it. In a word, our friend indorses a method well known and useful, but applicable, all things considered, in comparatively few cases, and then only under the best conditions; but the price must fit. The average of taxidermy has been greatly raised in this country of late years; this has been almost entirely accomplished by manikins and the use of clay under proper conditions; let us not burn the ship that has carried us safely over, but rather treasure it for the good it has done and will do yet.

WILLIAM PALMER.

Some Oddities of the Field.

MEMPHIS, Tenn.—I write to ask as well as to give information about curios of land and water. Two seasons ago at Wappanocca Lake, Ark., I killed a perfect cross of mallard and pintail, and this season at the same lake Mr. J. A. Austin, of Memphis, killed another distinctly and beautifully marked pintail-mallard drake. Mine had the dark green head and neck, with white ring, purple breast and court beauty-spot of black and white of the mallard drake, but excepting also the mallard's yellow bill. It was an excellent pintail in back, dark feet and finely pointed tail, also in shape of body; Mr. Austin's hybrid had the mallard body, head, neck, breast and rear beauty-spot, but slate-colored bill and feet and perfect sprig's tail.

Passing through Freyler's Corner during an extremely violent wind, my boat put thousands of ducks and hundreds of geese to flight, but I did not fire, so they would return. Watching the wheeling, rushing, circling myriads, my punter, Adam Green, said: "Look! a duck is falling," and sure enough the lightning down-winders had collided with a bested up-winder and knocked him down, though he rallied from an icy bath and human touch.

At Atoka, Tenn., while quail shooting with Wm. Elison, we fired at a bevy of quail flying through thin woods near a cottage, when a fine hen bird, which was, like Lot's wife, looking backward, crashed against the house and killed herself. We added six more to give the rosy matron a Sunday feast as she opened the door to our supposed knock. Once before in a storm I saw part of a flushed covey fly against a cannon-ball express train.

I was recently paddling through a wooded arm of Wappanocca Mud Flat when three geese crossed in front, and firing at the middle man, though rather high for duck shot, I wheeled my revolving chair sharply to left to kill an easy one that rose at report from wet grass, when my punter yelled, "Dat fust goose dun broke hees own wing a-climbin'," and it was even so; a small chilled shot had pierced the wing bone, and the weight and strain of "climbin'" snapped it.

My next tale is of a fox squirrel's tail, and my excellent cruiser was and is Ebenezer Wingfield. We had thirty ducks by 11 A. M. (the limit is fifty), and as we cruised along the "cypress side" a fox squirrel on a "knee" was eating an oily cypress ball and never dropped it as he scurried up to a flat limb, and spreading out, shook his red flag at us like a Spanish girl's flaring scarf at a mad bull. Eb begged the gun and two goose shells to "hist him wid one and bust him wid tuther bar'l," and turned loose "the Thunderer" from a rest. Down rushed the bob-tail squirrel on Eb's blindside, and again "the Thunderer" belched fire, as Ebenezer shot through the grapevines at only the tail, which ends here.

W. A. WHEATLEY.

A Word for the Red Squirrel.

GRAND VIEW, Tenn., Feb. 20.—*Editor Forest and Stream*: I notice that the characteristics and habits of that erratic and lively little rodent, the red squirrel, have been pretty thoroughly discussed. It reminds me of an old story.

It was said that Daniel Webster, when about sixteen years of age, made his first plea on a case of trespass. Dan's elder brother, Ezekiel, had caught a woodchuck in the bean patch. According to the unwritten law punishment for trespass by woodchucks was the death penalty, and Zeke was preparing to kill the animal when Dan interfered, contending that the chuck should be set at liberty. While the contest was waxing hot between the two boys the elder Webster came along and proposed to be judge and jury, and that Dan and Zeke each should make his plea for and against the prisoner. It was said that Zeke made out a pretty strong case against the prisoner; but before Dan got through with his plea his sympathetic appeal had worked on the old man's feelings so powerfully that a tear could be seen in the corner of each eye, and he cried out: "Zeke, let that woodchuck go!"

My opinion is favorable toward the red squirrel. It is true that in my boyhood days there was always a sort of good-natured warfare between us; he was fond of stealing my butternuts, and I was just as fond of throwing stones at him, in which I generally came off second best. He had a trick of laying flat on a horizontal limb and dodging every stone that was likely to cut very close by slipping over on the opposite side, then coming back on the top ready for another throw. The result would be that he would come off unscathed, while I occasionally came off with a lame arm; and you may be sure that it required considerable stone throwing to lame a boy's arm in those days.

In my very early youth, when six or seven years of age, I caught several red squirrels with a little rat trap, and dressed the skins, and of them my mother made for me a very nice cap, which was about the first head covering I remember wearing.

But I have never wantonly destroyed many red squirrels, nor wished that their numbers were any less. They store up provender when it is plenty, and they are well able to forage for a living when it is scarce. Their diet consists of a great variety of food, and if nothing better is found they can live on the buds of the willow and soft maple; and mushrooms or toadstools are their delight. They are the most lively and active of all squirrels, and are out in the coldest days of the Northern winters, when they are found in the beech and maple woods and in pine and hemlock forests, and they are plenty in butternut groves. I believe that red and black squirrels are not found in this State.

ANTLER.

Bluebirds and Robins Winter in Connecticut.

HAMDEN, Conn., Feb. 27.—*Editor Forest and Stream*: I send you a few sprigs of swamp, or pussy, willow. Their velvet buds will show that spring is coming, and I send them as that glorious season's first harbinger. I cut them in a small swamp to-day—a place where the cold never seems intense, and where bluebirds and robins live the year around. It is an indisputable fact that nearly all individuals consider the bluebird the first harbinger of spring. In this vicinity, however, I have abundantly proved, to my own satisfaction, that this notion is an extremely erroneous one. During the past three winters I have closely observed this cheerful little warbler, and can emphatically declare that some of them stay with us through the coldest weather. Especially through this winter have I kept a vigilant watch upon them, and the results of my observations have afforded me considerable gratification. Not only have I seen them whenever I felt so inclined, but I have heard their warble, at some time, in every month since winter commenced.

One warm day about the middle of January a robin perched himself in the top of an apple tree near the house and regaled us with a burst of melody.

Some Sunday near the last of April, after the frost has disappeared and the cowslips are in blossom, some hibernating, petty city politician will break away from the side entrance of his favorite saloon, don his new spring suit and sally forth to the outskirts of his political bailiwick; here he will hear a bluebird warble. He will then hustle back and disclose the astonishing intelligence to some eight-dollar-a-week reporter on one of the city dailies. Then the electrifying news will be heralded far and near that "Councilman So-and-so saw the first bluebird of the season to-day. Spring is surely with us."

I simply judge from established precedent in this vicinity.

WILLIAM H. AVIS.

Intimations of Spring.

MILHURST, N. J., March 5.—*Editor Forest and Stream*: The vernal migration of the avian hosts is fairly on throughout this section, as one can at almost any time see large flocks of both crow and red-wing blackbirds, and also robins in considerable numbers; besides, the bluebirds are coming fully up to their old-time numbers, seemingly. Many of the ground birds and the bush birds are also here. A great many meadowlarks live in this part of the State—more in proportion than in any other district that I have ever been in.

Along the brookside the spathe of that highly odorous harbinger of spring in the vegetable world in this latitude—skunk cabbage (*Symplocarpus foetidus*)—is already out in its full size and beauty. By the way, there are more points of beauty in the spathe—yes, and in the leaves also—of that plant than many who are admirers of plant-life, and others who are supposed to be well versed in botany, are aware of. Catkins on the willows also are out—another sign that spring, with all its floral attractions, will soon be with us.

A. L. L.

The Third Linnean Society Lecture.

THE third Linnean Society lecture in the American Museum will be delivered by Mr. Ernest Seton Thompson on March 17. It was provisionally entitled "Mammals of North America. It should have been "A Picturesque View of Some of the Mammals of North America." The lecture is to be limited practically to the mammals of the Yellowstone Park, and is to be fully illustrated with lantern slides of sketches and photographs taken there last summer by Mr. Thompson. The slides will illustrate: Tracks in the snow; tracks in the dust; dogs, gophers and coyotes; beavers and their work; bands of elk; the bears of the Park; the gray wolf hunting; trapping the gray wolf.

The previous lectures were by Prof. D. G. Elliott, of the Field Museum, and Mr. Frank M. Chapman, of the American Museum. The final lecture, April 7, will be by Dr. C. Hart Merriam, of the Department of Agriculture.

Early Spring Birds.

NEW YORK.—While walking along the West Drive of Central Park on Feb. 26 I saw, close to the smaller reservoir, a flock of white-throated sparrows. They were in full song, and allowed me to get quite near them.

Is this not rather early for them?

I had heard song sparrows in the same neighborhood on Feb. 17.

WM. COFFIN DORNIN, JR.

Take inventory of the good things in this issue of *Forest and Stream*. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Game Bag and Gun.

Non-Resident Licenses.

FRIENDS in the West recently told me of certain experiences which they had while on a shooting trip in North Dakota. The questions involved were of so much interest to me that I went to some trouble to look them up, and I now venture to send to the *FOREST AND STREAM* the results of the search.

My friends' experiences were connected with the taking out of permits for shooting, which is made necessary by recent legislation in North Dakota, and which in the case of non-resident sportsmen has a tendency toward making a lean purse.

The legislation to which reference has just been made is so important that perhaps it will be best to quote at length from the statutes. The North Dakota statute is as follows:

Laws of North Dakota, 1897, page 128, Section 1643: It shall be unlawful for any person to hunt, kill or wound, in this State, any of the wild animals or birds mentioned in Section 7677 of the Revised Codes of North Dakota, as amended, without having first obtained a permit as hereinafter provided for, which permit shall be subject to inspection by any person upon demand, and any person violating any of the provisions of this section is guilty of a misdemeanor, and upon conviction thereof shall be fined not less than \$20 nor more than \$50, or may be imprisoned in the county jail not more than thirty days, or may be subject to both such fine and imprisonment; provided, however, that nothing in this section shall prevent any resident of this State or member of his family living at home from hunting on lands owned or controlled by him during the open season, as provided by law. Unless such person, either alone or with another or others, uses any dog in hunting, setting, pointing or retrieving any game, in which case such permit must first be obtained.

Section 1644: The State game warden shall cause forms of such permits to be printed, which shall be substantially as follows: State of North Dakota. County of —, ss. * * * a * * * resident of North Dakota, is hereby licensed to hunt in North Dakota under the provisions and conditions of the game laws thereof from Aug. 20 to and including the 15th day of December next after the date of this permit. This permit is non-transferable.

Dated at —, this — day of —, 189—. —, County Auditor.

Such permit shall be indorsed by the State game warden and issued by him to the county auditors of the several counties of the State.

Section 1645: The county auditor shall fill out and issue one of such permits to any person applying therefor on payment of \$25 if the applicant is a non-resident of the State, and on payment of 75 cents if the applicant is known to the auditor or satisfactorily proven to him to be a resident of this State. Provided that any non-resident who may own cultivated lands, or be carrying on the cultivation of any lands in the State, not less than one-fourth section, for a period of not less than one year prior to the time of making application for such license shall be entitled to take out a resident's permit, whether such non-resident is the owner of the lands so cultivated in whole or in part. Provided that such non-resident shall take out such permit in the county where such cultivation is carried on. * * * Such permit shall authorize the holder to hunt throughout the State either with or without dogs. * * *

Emergency: Whereas an emergency exists in that there is no adequate law on the subject matter of this act, therefore this act shall take effect and be in force from and after its passage and approval. Approved Feb. 26, 1897.

The Revised Codes of North Dakota, Section 7677, referred to above, mentions prairie chickens, pinnated grouse, sharp-tailed grouse, ruffed grouse, woodcock, plover, wild duck, wild goose or brant, buffalo, elk, deer, antelope, caribou or mountain sheep.

Another statute on similar matters in South Dakota is as follows:

Session Laws of South Dakota, 1897, page 184, Chapter 66, Section 1: It shall be unlawful for any person not a bona fide resident and citizen of the State of South Dakota to pursue, hunt, kill or capture in any way or manner, or by any means or device, within the borders of said State, any buffalo, moose, elk, deer, antelope, mountain sheep or mountain goat. Approved March 9, 1897.

It may prove of interest to men fond of shooting if we take a look at these statutes and see whether they are likely to be held constitutional by the courts of the United States in the event of litigation in the matter.

Wisdom requires that our first step should be to go to our files of *FOREST AND STREAM* and see whether that paper can give us any aid. We find that, as we had expected, the *FOREST AND STREAM* has spoken at length upon a subject near enough to our present subject to give us great help. The kindred subject is discussed in the number of that journal for March 26, 1896, and there is printed in that number in full a most scholarly and learned opinion by Mr. Justice White, of the Supreme Court of the United States, in the famous case of "Geer against Connecticut."

This opinion of Justice White seems to contain the proper material to form the ground work and basis of our present discussion. In order to bring the facts to mind we now give a short statement of the issue in the case of "Geer against Connecticut."

In the language of Justice White: "The sole issue which the case presents is, was it lawful under the Constitution of the United States, Section 8, Article I., for the State of Connecticut to allow the killing of birds within the State during a designated open season; to allow such birds when so killed to be used; to be sold and to be bought for use within the State, and yet to forbid their transportation; or, to state it otherwise, had the State of Connecticut the power to regulate the killing of game within her borders so as to confine its use to the limits of the State, and forbid its transmission outside of the State?"

The majority of the Court agreed that the State of Connecticut did have such power, and that its exercise was not in violation of the Constitution of the United States.

It will be noticed that the question in the Geer case turned upon the proper interpretation of the "commerce clause" in the Federal Constitution, Section 8 of Article I., which says:

"The Congress shall have power to regulate commerce with foreign nations and among the several States and with the Indian tribes."

We shall find, I think, that the question in the Dakota statutes does not involve the commerce clause of the Constitution of the United States, but does involve certain other important clauses of the Constitution, to be referred to shortly. In spite of this difference between our case and the Geer case, the opinion of Mr. Justice White will throw great light, I am sure, upon the problem which confronts us.

The solution of our problem, I apprehend, requires an answer to these questions:

(1) Are the Dakota statutes in conflict with the "privileges and immunities" clause of the Constitution? This clause is found in the Constitution of the United States, Article IV., Section 2, which says:

"The citizens of each State shall be entitled to all privileges and immunities of citizens of the several States."

(2) Are the Dakota statutes in conflict with the "equal protection of the laws" clause of the Constitution? This clause is found in the Amendments to the Constitution of the United States, Article XIV., Section 1, which says:

"All persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws."

Inasmuch as the discussion of the above questions may require some length, it seems as well to give here the answers, and then try to protect the answers by building for them a fortification of precedent in legal decision.

I think a negative reply should be given to each one of our questions, though any one familiar with "the dry bones of the law" will probably pardon me for adding that I venture this opinion with hesitation. One can never be sure of what conclusion courts will come to upon questions arising under the Constitution of the United States.

Now for our attempt to make a fortification in protection of the answers given above.

At the very outset it becomes necessary to get a clear and distinct notion of the nature of the property in game as recognized by law. For this purpose we cannot do better than to refer to the opinion of Mr. Justice White in the Geer case. The Justice has there, with great care and with keen judicial reasoning, traced this subject from the earliest days down to the present. Any one interested should certainly read in full the opinion of Mr. Justice White; but in this article it will perhaps suffice to give in a brief and general way merely the conclusions to which the Justice comes. These conclusions are that uncaptured wild game in a State belongs to the people in their collective sovereign capacity, and that the States have the right to control and regulate the common property in game. The Justice says in his opinion:

"While the fundamental principles upon which the common property in game rests have undergone no change, the development of free institutions has led to the recognition of the fact that the power or control lodged in the State, resulting from the common ownership, is to be exercised, like all other powers of government, as a trust for the benefit of the people, and not as a prerogative for the advantage of the Government, as distinct from the people, or for the benefit of private individuals, as distinguished from the public good. Therefore for the purposes of exercising this power the State, as held by this court in *Martin against Waddell*, 16 Peters 410, represents its people, and the ownership is that of the people in their united sovereignty. The common ownership is thus stated in a well-considered opinion of the Supreme Court of California:

"The wild game within a State belongs to the people in their collective sovereign capacity. It is not the subject of private ownership, except in so far as the people may elect to make it so, and they may if they see fit absolutely prohibit the taking of it or traffic and commerce in it if it is deemed necessary for the protection or preservation of the public good."—*Ex parte Maier*, 103 California 476.

"The same view has been expressed by the Supreme Court of Minnesota, as follows: 'We take it to be the correct doctrine in this country that the ownership of wild animals, so far as they are capable of ownership, is in the State, not as a proprietor, but in its sovereign capacity as the representative, and for the benefit of all its people in common.'—*State against Rodman*, 58 Minn. 393."

The learned Justice says also in a later portion of his opinion that the State has power to preserve game under the police power.

"Aside from the authority of the State, derived from the common ownership of game, and the trust for the benefit of its people, which the State exercises in relation thereto, there is another view of the power of the State in regard to the property in game, which is equally conclusive. The right to preserve game flows from the undoubted existence in the State of a police power to that end, which may be none the less efficiently called into play, because by doing so interstate commerce may be remotely and indirectly affected (cases cited). Indeed the source of the police power as to game birds (like those covered by the statute here called in question) flows from the duty of the State to preserve for its people a valuable food supply. (Cases cited.)

"The exercise by the State of such power therefore comes directly within the principle of *Plumley against Massachusetts*, 155 United States 461, 473. The power of a State to protect by adequate police regulation its people against the adulteration of articles of food (which was in that case maintained), although in doing so commerce might be remotely affected, necessarily carries with it the existence of a like power to preserve a food supply which belongs in common to all the people of the State, which can only become the subject of ownership in a qualified way, and which can never be the object of commerce except with the consent of the State, and subject to the conditions which it may deem best to impose for the public good."

Having now gained, I hope, a clear idea of the nature of the property in uncaptured wild game, and the power of the State to regulate the taking of game, we are in a position to examine the statutes in question, and see whether they are likely to stand or fall if the batteries of the Constitution of the United States are ever brought to bear upon them.

Taking up first the "privileges and immunities" clause of the Constitution, does the statute which charges a non-resident \$25 for the permit allowing him to shoot violate one of his "privileges or immunities" under the

Constitution of the United States? It would seem not, for, whatever may fairly come under this clause of the Constitution, it is tolerably certain that the right to shoot would not come under it. The right to shoot is a right which tends (strongly or weakly according to how well he can shoot) to give the shooter an interest in the common property, that is, in the wild game, of the citizens of another State. It is held that "The second section of the fourth article of the Constitution, which declares that 'The citizens of each State shall be entitled to all privileges and immunities of citizens of the several States,' does not vest the citizens of one State with any interest in the common property of the citizens of another State." See *Macready against Virginia*, 94 United States 391. In that case it appears that "A law of Virginia by which only such persons as are not citizens of that State are prohibited from planting oysters in the soil covered by her tide waters is neither a regulation of commerce nor a violation of any privilege or immunity of interstate citizenship."

Mr. Chief Justice Waite says in his opinion: "The principle has long been settled in this court that each State owns the beds of all tide waters within its jurisdiction unless they have been granted away. (Cases cited.) In like manner the States own the tide waters themselves and the fish in them, so far as they are capable of ownership while running. For this purpose the State represents its people, and the ownership is that of the people in their united sovereignty. *Martin against Waddell*, 16 Pet. 410. The title thus held is subject to the paramount right of navigation, the regulation of which, in respect to foreign and interstate commerce, has been granted to the United States. There has been, however, no such grant of power over the fisheries. These remain under the exclusive control of the State, which has consequently the right in its discretion to appropriate its tide waters and their beds to be used by its people as a common for taking and cultivating fish, so far as it may be done without obstructing navigation. Such an appropriation is in effect nothing more than a regulation of the use by the people of their common property. The right which the people of the State thus acquire comes not from their citizenship alone, but from their citizenship and property combined. It is in fact a property right, and not a mere privilege or immunity of citizenship."

By Article IV., Section 2, of the Constitution the citizens of each State are "entitled to all privileges and immunities of citizens in the several States." Mr. Justice Washington, in *Corfield against Coryell*, 4 Wash. c. c. 380, thought that this provision extended only to such privileges and immunities as are "in their nature fundamental; which belong of right to the citizens of all free governments." And Mr. Justice Curtis, in *Scott against Sandford*, 19 How. 580, described them as such "as belonged to general citizenship." But usually when this provision of the Constitution has been under consideration the courts have manifested the disposition not to attempt to define the words, but "rather to leave their meaning to be determined in each case upon a view of the particular rights asserted or denied therein." This clearly is the safer course to pursue when, to use the language of Mr. Justice Curtis, in *Conner against Elliott*, "we are dealing with so broad a provision, involving matters not only of great delicacy and importance, but which are of such a character that any merely abstract definition could scarcely be correct, and failure to make it so would certainly produce mischief."

"Following then this salutary rule, and looking only to the particular right which is here asserted, we think we may safely hold that the citizens of one State are not invested by this clause of the Constitution with any interest in the common property of the citizens of another State. If Virginia had by law provided for the sale of its once vast domain, and a division of the proceeds among its own people, no one, we venture to say, would contend that the citizens of other States had a constitutional right to the enjoyment of this privilege of Virginia citizenship. Neither if, instead of selling, the State had appropriated the same property to be used as a common by its people for the purposes of agriculture, could the citizens of other States avail themselves of such a privilege. And the reason is obvious; the right thus granted is not a privilege or immunity of general, but of special, citizenship. It does not 'belong of right to the citizens of all free governments,' but only to the citizens of Virginia, on account of the peculiar circumstances in which they are placed. They and they alone owned the property to be sold or used, and they alone had the power to dispose of it as they saw fit. They owned it, not by virtue of citizenship merely, but of citizenship and domicile united; that is to say, by virtue of a citizenship confined to that particular locality."

"* * * Virginia, owning land under water adapted to the propagation and improvement of oysters, has seen fit to grant the exclusive use of it for that purpose to the citizens of the State. In this way the people of Virginia may be enabled to produce what the people of the other States cannot; but that is because they own property which the others do not."

It would seem that the point decided in the Virginia case was extremely like the point we are trying to decide. If we change the language used in the last part of the above quotation from the Virginia case to make the language fit the facts of our case the result appears to bring about a chain of reasoning which is as good for our question as it was good in the Virginia case. We have this language produced by the change: "The Dakotas, owning the uncaptured wild game in their respective States, have seen fit to make restrictions as to the pursuit of that game which are harder on non-residents than on residents. In this way the people of the Dakotas may be enabled to get game in a way that the people of the other States cannot; but that is because they own property which the others do not."

The language in the Maier case quoted above, in the opinion of Mr. Justice White, seems strong to show that the Dakota statutes are good under the "privilege and immunity" clause of the Constitution. Surely if the people of the State may "absolutely prohibit" the taking of game they may regulate it as they have done in the Dakotas.

Now we come to our second question, namely:

Are these statutes good under the "equal protection of the laws" clause of the Constitution?

Here the Macready case seems to give us more assistance when it says: "But that is because they own property which the others do not." We find that the basis of classification in the Dakota statutes is the ownership of property. The people resident in the State, the owners of the property in the wild game, are formed into one class; the non-residents, who do not own such property in the game, are formed into another class. It is certainly fair to make classes, with this good and valid distinction between them as a basis.

When once the classes are formed, every one in the same class is treated alike, and no one is denied the equal protection of the laws. Each man gets as much protection as does every other man in his class. When you can prove that the basis of classification is a fair one, and that all in a class are treated in exactly the same way, the "equal protection" clause of the Constitution is satisfied.

In *Home Insurance Company against New York*, 134 United States 594, the court, speaking through Mr. Justice Field, said: "Nor does the amendment (14th) prohibit special legislation. Indeed the greater part of all legislation is special, either in the extent to which it operates or the objects sought to be obtained by it, and when such legislation applies to artificial bodies it is not open to objection if all such bodies are treated alike under similar circumstances and conditions in respect to the privileges conferred upon them, and the liabilities to which they are subjected. Under the statute of New York all corporations, joint stock companies and associations of the same kind are subjected to the same tax. There is the same rule applicable to all under the same conditions in determining the rate of taxation. There is no discrimination in favor of one against another of the same class." (Citing a long list of authorities.)

If our reasoning is correct, it appears that sportsmen must put up with the burdens of these Dakota statutes. The only other way open to them seems to be to "Move your family westward," as the old song goes. Ardent sportsmen may find it advantageous to go to the Dakotas and become bona fide domiciled residents of those States. The many worthies who of late years have been going to the Dakotas for their divorces seem to have found material advantages in gaining a Dakota domicile.

Yet there may be one more way left to the non-resident gunners. Why could they not become owners, "in whole or in part," of one quarter section of cultivated lands a year before the shooting season? The part of the quarter section owned by the sportsman might be a very small one and yet come within the statute. Doubtless some obliging farmer friend could be persuaded to sell out a very, very small interest in the quarter section. Who knows but that this may not be after all the solution of the question? If it is, we have a modern illustration of the way in which statutes were evaded long ago. Mr. Williams says of a method of evasion of an old statute relating to real property:

"It was not long, however, before a 'loop hole' was discovered in this latter statute, through which, after a few had ventured to pass, all the world soon followed."

Perhaps all the world of sportsmen will follow some daring gunner through this "loop hole" in the North Dakota statute, if "loop hole" it should prove to be.

WILLIAM A. TALCOTT, JR.

NO. 44 BROAD STREET, New York.

Washington's Depleted Game Fields.

OROVILLE, Wash., Feb. 24, 1898.—*Editor Forest and Stream:* Along the Okanogan River, below Oroville, there is a very rough country, and to take a birdseye view of it from a distance one would not think there was level ground enough on which to set a hen; but when you get up among the rocks there are numerous little flats, and the grass and weeds start there much earlier than anywhere else, and the deer come out from the mountains to get the first green food of the year.

Friday, Feb. 18, as I came down from Oroville, I met eight Indians, all on foot, going hunting up in the rocks. As the chinook wind was blowing from the south, the Indians went up to the north end, and then scattered out and hunted back for some five miles. The next day I saw one of them, and asked him how many deer they had killed; he told me one. I asked how many they had seen, and he said five. This shows that it will not be many years before venison will be a great luxury, as well to the Siwash as to his pale-faced brother. There are a few mountain sheep still left on Mount Chapacca, some twenty miles north and west of here. Our local paper gave an account of an old hunter killing five a few days ago, and wounding three more.

Yesterday I met an old friend, who told me he had been at work up across the line, and that the deer were plentiful up there; and he had killed two at one shot this winter. He said the deer seemed to know just where the line was, and stayed well on the other side. And so it will not be long before magpies and coyotes will be the only kind of game left to be hunted by

LEW WILMOT.

Megantic Club.

At the annual meeting of Megantic Fish and Game Corporation, held in Portland, Me., the following directors were elected: Clarence A. Barney, Albert Bernard, L. Dana Chapman, S. F. Johnson, Dr. W. G. Kendall, W. A. Macleod, C. W. McConnell, D. C. Pierce, Arthur W. Robinson, H. W. Robinson, Harry W. Sanborn, F. W. Webb, Boston; George H. Burt, Hartford, Conn.; Philander Cutler, Binghamton, N. Y.; G. A. Gibson, Medford; A. W. Gleason, New York; Dr. J. B. Harvie, Troy, N. Y.; A. R. Justice, Philadelphia, Pa.; Jeremiah Richards, New York.

Dr. George W. Way, of Portland, was chosen clerk and L. Dana Chapman assistant clerk. The treasurer's account showed receipts with cash on hand at the beginning of the year of \$15,812.48; expenses for the year with cash on hand at its close \$15,812.48. The assets of the club in cash, bills receivable and value of the property held amounts to \$23,621.64, against which are liabilities to the amount of \$4,161.17, not including capital stock and surplus account, and of these liabilities the amount of \$3,650 is in mortgage and bonded indebtedness, leaving the floating indebtedness \$511.17, against which the club has accounts receivable of \$1,503.11.

the inside. It is very warm and is thick, but soft and pliable. The way to wear it is to put a pair of wool socks on first, then the German socks, then overshoes, rubbers or moccasins. Unless one had very large rubber boots he could hardly wear them over these socks. A more suitable sock for this purpose would be a heavy knit one. I once purchased the German socks of Montgomery Ward & Co., Chicago, but later learned that they were not carrying them, although they may be doing so now. I think M. F. Kennedy & Bros., of St. Paul, could supply them. They are more apt to be found in the Northern towns where the lumbermen outfit, although not all "lumbermen's socks" are the real German socks to which I have earlier referred.

Mr. J. H. Pierce, of Hebron, W. Va., called at the FOREST AND STREAM office to-day. He is on his way to Seattle, Wash., and expects to go thence to the gold country of the Klondike. May he have the best of luck.

E. HOUGH.

Making the Most of It.

NATE and I had agreed one evening while watching the snowflakes come floating gently down to try for a jack rabbit the next morning. The jack rabbit is rather a scarce article in this vicinity, yet Nate had secured several already this winter and thought he knew a locality where more might be found. I was not greatly in want of a jack rabbit, but was glad of any excuse to try my new gun stock. The stock as sent out from the factory had only a drop of about 2½ in., which obliges a man of my height (6ft. 4in.) to draw his neck somewhat in the shape of a letter S to take aim along the barrel. Fearing I might acquire a permanent crook in my neck, to say nothing of the inconvenience of so straight a stock, I had made a stock to suit my own notions, as well as to fit my elongated neck. This stock has a very decided pistol grip and a drop at the heel of 4 in.

It was a lovely morning, just cold enough so the newly fallen snow lay on the ground without thawing. A drive of a couple of miles in Nate's cutter behind a good horse brought us where we expected to find jack rabbit signs. After hunting over cornfields and meadows for over an hour without so much as finding a jack track, we concluded to follow the editorial advice on the first page of FOREST AND STREAM of Jan. 15, entitled "Making the Most of It." And so we drove about a mile further east, where we knew there were a goodly number of cottontails in a large weed patch of some five acres extent.

Nate went through one side of the patch and I parallel with him through the other side. The fun commenced at once, and in an hour we had twenty-one rabbits. As we did not want all the rabbits in the country we quit and drove to East Indian Creek, and we started up the stream. The first thing to attract attention was a wolf track, which we followed 200 yds., when it turned toward the heavier timber. Knowing it was useless to follow the wolf track, we went on to the spring, about a quarter of a mile from the road, where we had tied the horse.

This spring, known to all the old settlers as the Johnson's Grove spring, has been flowing steadily to the knowledge of the oldest settler for over forty years. The water bubbles up from a slight depression in the creek bank, not more than 40 ft. back from the creek. Ten years ago, while standing by the spring one summer day, watching the bubbles float on the water a short distance and then burst, the question came up in my mind as to what made the bubbles. When I put a lighted match to a floating bubble there was a miniature flash, such as would be made by a grain of gunpowder when ignited. The bubbles were evidently caused by escaping gas from the depths of the earth. The water standing in little puddles along the margin of the stream bore on its surface an oily coating. The spring still flows and bubbles, and even in the dead of winter the oil shows on the surface of the puddles. Who knows but some day this region may develop into a great gas field? There have been other good gas indications along this stream, and about eight miles south from the spring a number of years ago a man boring for water struck a flow of gas at a depth of about 70 ft., which he utilized for several years for heating and cooking purposes. There has never been any prospecting done in this locality with a view of finding gas in large quantities, but that it does exist I am satisfied.

On our return to the cutter we added four more rabbits to the pile, making an even twenty-five. As fifteen of this number had fallen to my gun, I announced to Nate the fact that I had reached my limit. Nate not wishing to hunt more we started for home. My new gun stock seems to fit all o. k., as I killed fifteen rabbits, missing only two.

JOHN C. BRIGGS.

NEVADA, Ia.

New York Game Law.

PROPOSED amendments to the game laws of the State of New York, recommended by the New York State Fish, Game and Forest League, at its annual meeting held at Syracuse, N. Y., Dec. 9, 1897, which are respectfully submitted to our Representatives in the State Legislature, and all others who are interested in game and fish protection, are:

Sec. 34. A new section to give protectors a right of search, in case they have reasonable cause to believe that fish or game have been illegally taken, or held in possession out of season. Without this power they cannot untie a bag string.

Sec. 41. To amend it to agree with Sec. 40, which permits the possession of venison up to Nov. 10, while Sec. 41 makes it illegal after Nov. 1. Sec. 40 was amended without changing Sec. 41.

Sec. 49. Squirrels and Rabbits.—To shorten the open season (making it Sept. 15 to Dec. 31) for protection.

Sec. 74. Grouse and Woodcock.—To make open season from Sept. 15 to Dec. 31, for protection.

Sec. 79. To make the same open season for meadow-larks. By these amendments the open seasons of sections 49, 74 and 79 are uniform.

Sec. 110. Black Bass.—To make open season June 15 to Oct. 31. Very few fish for bass after Nov. 1, but the season is kept open. This enables the netters to sell their bass through November and December. Bass

are growing scarcer, and artificial propagation is as yet a failure. By saving adult fish in the fall (November and December) we will have just so many more spawners in the spring. For twenty years only two things have been done to protect this noble fish: making the 8 in. limit, which is good, and making the season to open June 15 instead of May 30, which is also good, but this is better than all.

Sec. 111. To make the limit of bass gin. instead of 8. In Canada and the St. Lawrence it is 10. Another good move for protection.

Secs. 117, 118. To repeal the sections as to fishways and signboards. These sections are merely a surplussage in the law. No attention is ever paid to them. They are valueless. They should be weeded out.

Sec. 134. To make meshes of nets in Lake Ontario 2 in. bar instead of 1½. Millions of young whitefish weighing only about ½ lb. are now taken. By increasing the size of mesh they will weigh at least 1 lb. The "babies" cannot then be taken.

Secs. 149, 151. To repeal those parts permitting general licensed netting. It has proven a failure.

Sec. 155. To establish a system of bounties for nets seized. It is a good idea. A few old nets may be turned in for the bounties, but the supply cannot last forever. It should pass as a measure of protection against illegal netting. The protectors need its assistance.

Sec. 234. To be amended so as to permit a verdict for only one penalty for the first offense. Throughout the State case after case has been lost by a jury bringing in a verdict of "no cause of action." The penalties are too heavy with a body execution behind them. It is believed that by giving this discretionary power many more favorable verdicts can be had and much more good be done.

Sec. 249. To repeal it. It permits a cold storage man to keep and sell game the year round, in season or out of season, if he can only show it came from a place 300 miles from the State line. This is very easy to do.

We ask the careful consideration and support of the foregoing proposed amendments by all our Representatives in the Legislature, since they have the unqualified indorsement of all true sportsmen, and all others who have any regard whatever for the protection of fish and game.

In submitting and recommending these proposed amendments it has been the particular aim of this Association to eliminate all local provisions, to the end that the fisheries, game and forest law may be made more uniform, intelligible and comprehensive in its terms and of universal application throughout this State.

We have diligently sought to properly and efficiently protect fish by commending the abolition of all spearing and netting in the inland waters.

Above all we most earnestly recommend the absolute repeal of Sec. 249 of the fisheries, game and forest law, which is a blot upon and a blight to all game protective interests.

We firmly believe that these recommendations of amendments are wise and wholesome, and that their adoption will secure just and proper protection to our fish and game, and we therefore urge you to give them your earnest and hearty support.

W. S. GAVITT, Pres.
ERNEST G. GOULD, Sec'y.

Caribou in Newfoundland.

ST. JOHN'S, Newfoundland, Feb. 20.—The following clipping from a Newfoundland paper will give the readers of FOREST AND STREAM a pretty fair idea of how plentiful this noble animal is in the island, and how it is being sacrificed:

"This time the Virginia Lake went up to White Bay after venison, and 600 carcasses were brought on board. Never before have so many caribou been seen or heard of in that direction; by day they can be described browsing like cattle on the hills, while one can go a mile in from the sea, and cross herds of hundreds. The winter is evidently very severe in the interior, and these are driven to the coast in quest of food. From Connaigre Bay to Fortune Bay herds of thousands have been seen, and only about eight or ten miles inside Burgeo whatever number are required can be killed with ease. In the bottom of the bays they have come to the very winter-tilt doors, and one man is reported to have shot a large stag while it was looking in his door. Under such circumstances the people are not short of fresh meat, and the 600 carcasses brought here will make venison a cheap article for the next fortnight."

The markets are blocked off with venison as a result, and it is quoted as low as 3 cents per pound. It is prohibited to kill deer after Feb. 1 till July 15, or from Oct. 9 till Oct. 20 in each year. The fishermen and poor settlers organize hunting parties, and not only secure venison enough for their own consumption, but also send large quantities to St. John's for sale. Notwithstanding the numbers slaughtered every year, there does not appear to be any great diminution in the herds. Of course such wholesale slaughter will soon have the effect of exterminating the species. Sportsmen are allowed to kill and take three stags and two does, and as this latter class only hunt during the late summer and autumn months, and hunt then for "heads," they do not affect the herds very much. These deer are all killed near the water line, so that the immense deer parks in the interior of the island fortunately remain untrodden.

W. J. CARROLL.

Maine Deer in Boston Market.

BOSTON, March 7, 1898.—When your correspondent, Mr. Hardy, declares that Maine big game is wintering well, and attempts to convey the impression that little, if any, hunting of deer in the deep snows is going on, I am satisfied that he is talking about that of which he is not well informed. If he had been with me Thursday, on a trip through the Boston markets, I could have shown him the saddles of at least a dozen deer, freshly killed. Then he might have asked the marketmen where they came from. Did they come from Maine? He would have been answered, as I was, "We don't know where they came from." Then he might have believed such a statement, or have granted that they did not come from

Maine. Earlier in the day he might have encountered a team with the same deer on board. He might have asked the teamster where he got them, and would have been answered: "Down 't th' wharf." Going to the wharf and making inquiries, he might be able to find that the deer came by coasting schooner. Why Mr. Hardy should wish it to appear that there is no illegal deer shooting going on in Maine, and especially in Washington county, I am at a loss to understand. If the Commissioners do not believe that the game is suffering from the poachers, why have they issued an appeal to the registered guides? Why have they started all their wardens off into the woods on snowshoes?

If Mr. Hardy will come to Boston, and marketmen will talk to him as they will talk to me, he will be convinced that at least fifty deer, illegally killed, have been received here during February and up to date in March. Had Mr. Hardy been here the other day I would have introduced him to a gentleman right from the Maine woods, where the snow is more than 5 ft. deep on a level. Lumbering is going on there, and the gentleman would have told Mr. Hardy that the deer are badly stranded by the snow, and in the struggle for existence they frequently get down into the lumber road. Ahead of the men and teams they have run two or three times along the road nearly down to the settlement; then, jumping to one side in the snow, they have floundered for a few minutes, then given up and been approached by the men, who have left them a wisp of hay. This they have most hungrily devoured.

SPECIAL.

The Boston Exposition.

EVERYBODY is talking about the big Sportsmen's Show to be given by the New England Association in the Mechanics building in Boston, March 14 to 26, which, with its six acres of floor space and its elegant appointments, is undoubtedly the finest and best equipped show building in the country. Daily accessions to the game park are being reported, many magnificent specimens of moose, elk, deer and caribou coming from Maine and New Brunswick, while the game of the famous Corbin preserve at Newport, N. H., have been placed at the disposal of the Association by their generous and public-spirited owners. From Canada, New Brunswick, Nova Scotia and Newfoundland come reports of elaborate exhibits demonstrating the fish and game resources of those countries, including many superb specimens of the larger game animals and several fine mounted collections.

The artificial lake occupies the center of Grand Hall, and will contain 220,000 gallons of water. Its shores slope gently from the level of the floor, and are fringed with moss, rocks and shrubbery, thus enhancing its realistic effect. On this lake various aquatic contests will occur, including expert canoeing by thoroughbred Indians, tugs-of-war, swimming, diving, upset races, etc., each day's programme being varied and interesting. The lake will also serve for the demonstration of launches, ducking boats, kayaks and other craft of interest to sportsmen, and here also the art of life-saving will be illustrated by expert swimmers and divers.

The entire area of the stage in Grand Hall has been metamorphosed into an Indian camp, scenic and realistic beyond anything hitherto attempted, where Indian braves, squaws and papposes, all wearing the primitive garments of savage life, will be found engaged in making snares, traps, weapons and canoes, and otherwise engaged in daily toil and occupation. Log cabins, tents and shelters will greet the visitor at frequent intervals, all practically equipped and occupied by guides and hunters; and echoing through the building will be heard game calls of all kinds by skilled huntsmen, specially engaged for this purpose.

Game birds from all sections of the country will also be seen to the best advantage, many of the species being practically unknown east of the Mississippi, and will be shown for the first time at any public exhibition in this city. These will include mallard, black, sprig-tail and canvasback ducks, and wood duck, the most elegantly plumaged game bird in America; American blue-wing and American and European green-wing teal; brant, snow, blue snow, white-pointed and Canada geese; Virginia (Bob White) and California mountain and valley quail; prairie chicken, ruffed grouse, and a fine collection of pheasants—Chinese, Japanese, Wallachian, golden, English, ring-neck, white, silver, and many rarer kinds, including the tragopans.

An event of interest to sportsmen was the recent arrival of a lot of live mountain quail, which made the journey across the continent, and are in excellent condition. This collection of birds will be viewed with great interest by New England sportsmen, most of whom will see this species of quail for the first time at the Sportsmen's Show.

An extensive exhibit of live game fish will be made with the co-operation of the United States Commissioners at Washington, who are sending a large number of mammoth glass tanks in which a great variety of the finest game fish of the country will be exhibited. There will also be a thoroughly equipped fish hatchery, which will prove of the greatest interest to students of fish life, not less than to the great army of anglers. Many of the specimens of live fish will be of noble size, and will include landlocked salmon, lake and brook trout, rainbow trout and large and small-mouth black bass.

The rifle and revolver competitions bid fair to prove of great interest, a number of prominent organizations and individuals having already entered. Among the crack teams who will compete will be one from the Brooklyn Revolver Club, another from the Massachusetts Rifle Association, and still another from the Smith & Wesson Revolver Club, of Springfield, Mass., who will represent America in the international tournament at Bisley next summer. The trophies for these competitions are very rich and elegant, being of sterling silver, with buckhorn handles, and mounted on ebony bases. Mr. F. B. Crowninshield, whose skill in handling the revolver is so widely known, is personally in charge of these competitions.

An art gallery, devoted exclusively to exhibits of amateur photography incidental to sportsmanship, bids fair to prove a most delightful feature, and is under the direction of Mr. Joseph Prince Loud, president of the Boston Camera Club.

Camp-Fire Flickerings.

"That reminds me.

"THE Superlative Man is abroad in the land. Everybody has met him, everybody has been bored by him; everybody knows him well, and yet few men will recognize him by his proper title."

We looked at one another through the pipe smoke, curling blue in the tent, and then looked at the Major, to see if we had understood him aright.

"Maybe you mean the Superfluous Man," remarked the Redoubtable Hunter, with a sly glance at the Colossal Liar; "in which case you are mighty near right."

"Being bred to the correct use of the English language, I mean what I say, sir," replied the Major, who both in and out of the woods is somewhat of an observer. When he gets into a talkative mood, he usually says something which, to quote the Colossal Liar, 'may or may not be so,' but which is, nevertheless, worth listening to.

"The distinguishing characteristic of the Superlative Man," went on the Major, "is an inability to state an unadorned fact. He is the man who cannot tell of what he has seen, heard, or done, unless he dresses the narrative out in adjectives of the superlative degree. I sometimes wish that there were no degree of comparison, but only the positive; because in that case we would all be saved a world of ridiculous exaggeration. Limited experience is the trouble with him. He forgets that other men have had experiences; the little that he sees, hears, or does, strikes him in every instance as being most remarkable. Hence, when telling of it, he makes so great a story out of scant material."

All eyes turned, as by one accord, toward the Invertebrate Fisherman, who puffed away obliviously.

"The Superlative Man is sometimes a fisherman," Vigorous nods of approval from all but one of the listeners. "He is the man who knows the best place to catch fish, and who never catches any but the very largest ones; who always has a Roland for your Oliver bass story. He is the man who is eternally telling about the 'biggest trout I ever caught'; and every time he tells about it, it is a different fish, in a different place, and captured under different circumstances. The newspapers call him the fish liar; but he is not a liar. He is only unable to see, or hear, or do anything that does not seem to him to be superlatively great.

"The Superlative Man is sometimes a yachtsman"—here the Story Teller's jaw fell—"but he never goes out for a quiet sail, and comes quietly home again. He is always dashing along, like an express train, under double-reefed mains'l and storm jib, lee rail buried under water, sir, and waves mountains high; he never saw such a black night, and oh-h-h! how it did blow. How he will pile up the adjectives to describe a barren little cruise in a tub of a boat that could not make three miles an hour without starting everything aboard; like a general who should let off a park of artillery, and then order up the whole line to dislodge a solitary sharpshooter.

"The Superlative Man is often fond of hunting"—Old Redoubtable began to look wild-eyed—"but he never killed a squirrel except from the very topmost branch of the tallest tree in the woods. He never blew a common chippy into annihilation, as most of us have done at some time in our lives; he could not see one; it would be as big as an eagle to him, and he would tell the story so. He never stopped a woodcock that was not making some phenomenal gyrations at an incredible distance; he could not shoot a plain, everyday partridge, on an easy quartering flight, because he never saw such a mark, and he never will. He simply could not see it—in that light. It would be 'Soyds. away, sir, and going like a rifle ball,' at the very least."

The Major paused a moment for breath, when the Redoubtable Hunter, who has been to Congress, seeing the floor vacant for an instant, struck in: "Speaking of partridges reminds me of a time when I was hunting in a piece of woods with a couple of friends. As we were leaving to go home I bethought me of a small, thick clump of second growth, where I could usually put up a bird. Calling my dog, I set off for the spot, which was near by, and upon entering the brush, sure enough, old Jack made the most beautiful stand you ever saw. I cocked the gun, and told him to 'put 'er up.' There was a tremendous uproar, and twenty-three partridges rose and thundered out of there. I let drive at the only one I saw, and brought him down, at least 60yds. off. He was a ———," and Old Redoubtable gathered himself for a creditable expression, while the Major, seeing his opportunity again, said: "If it was the only one you saw, how do you know that there were twenty-three birds in that covey?"

"How do I know? Why, by the noise they made as they flew out," replied the Redoubtable Hunter, somewhat nettled.

"You illustrate my remarks," pursued the Major. ("The old fool must mean 'interrupt,'" whispered the Hunter to the Story Teller; but the Major was under full headway, and all listened.)

"The Superlative Man does not usually like to have his yarns questioned; he tells the story precisely as he saw it; but he sees all things with magnifying vision. His whole being is a large exclamation point, and his conversation bristles with italics. Mind you, he is not profane; when a man tells a story which abounds with big oaths, one is pretty safe in doubting the truthfulness thereof. But it is not so with the Superlative Man; as profanity is only used by liars, and men of small vocabulary, he needs none of it. He does not want for words, and he is not a liar. He is only just superlative."

The Major knocked the ashes out of his pipe, and rolling himself in his blanket, slept the sleep of the just; but we all hated him for twenty-four hours. D. F. H.

New York.

Sea and River Fishing.

Some Virginia Men and Fish.

BY FRED MATHER.

IN FOREST AND STREAM of May 1, 1897, there is a sketch of Delaware Bradbury, a Pamunkey Indian with whom I fished, and as the name is variously spelled—Bradbury, Bradby and Bradley—I expected some of the Richmond sportsmen would set the question at rest before I embalm Delaware in a second volume of angling companions, for the first one has been so well received that next fall may see another collection hurled at the public, and they most probably will cry "enough." But there were things in that article calculated to make some Virginian rise and tell some yarns about Delaware and his brothers, who are kept busy in the open season by sportsmen, especially those from Richmond; but there was not a rise made to this fly.

A few weeks in the fall of 1875 I was busy, at Blacksburg, where I made the acquaintance of your old angling correspondent, Dr. M. G. Ellzey, then a professor in the Military and Agricultural Academy there. We talked of fishing in New River, and planned a trip which never came off. The stream there was not fit for a salmon hatchery, and I took one of his students, Mr. W. F. Page, and went up into Rockbridge county, by advice of Dr. Robertson, of Lynchburg, then a State Fish Commissioner; and the late Col. Marshall McDonald, a professor of mathematics, if memory serves, in the fine State Military Institute at Lexington, had most comfortable quarters assigned us in the State building. Here was the necessary fall to the water, and as soon as the hatchery was planned and under way I left the carpenters to finish the work, with Page to oversee it, and I went off to Richmond to fish with Mr. Alexander Mosely, then editor of the Richmond Whig.

At this time politics in Virginia had cooled from a white heat through the different shades known to those who temper steel until it might be said to have reached the stage of "cherry red," but was still red hot. Mosely, whose particular brand of politics is forgotten—for he only talked of fish to me—said: "I can't fish with you to-morrow, as I promised, as I have important engagements to-night and to-morrow; but come with me and meet an enthusiastic fisherman with whom you can swap lies, and we will fish later. He introduced me to Capt. Jack Yeatman, commanding a packet on the James River and Kanawha Canal, whom I had met in his native town of Lynchburg, but did not know that he was an angler.

Capt. Jack talked of catching "jack," and as this is an old English name for pike, when below a certain weight, I naturally talked of the pike of New York, which grows to a weight of 30lbs. or more, and we got all mixed up.

"Yes, sir," said I, "in the State of New York we get 'jack,' as you call them, which occasionally—not always—weight 30lbs.; the people there commonly miscall them 'pickerel,' but they are the true pike of Europe, where a small one is called 'jack.' I have no ambition to pose as a champion fish liar, for there are too many aspirants for the belt, but in the North we have a brother to the pike which we call a mascalunge, with more or less variety in spelling and pronunciation, which has been known to reach a weight of 80lbs."

Capt. Yeatman's eyes ran up and down my 5ft. 6, looked me in the eye and said: "Let's have another lemonade."

Just then Mr. Mosely and friend dropped in, and after a general talk on fish, and pike in particular, Mosely said: "Our Yankee friend is right, Capt. Jack. This little fish in our Virginia waters, which was named for you, centuries before you were born, is only one of a family which has members that exceed ours in weight as much as Barnum's fat woman exceeds the avoirdupois of the average Virginia dame. Is that a correct statement, Yank?"

"Yes, the statement is correct, but you must take into consideration that the species are different. We have your species and two larger kinds, as well as the little brook pike, which seldom exceeds 8in., and abounds in most streams on the Atlantic coast from Cape Cod to Florida. The great lake pike and the mascalunge have been often taken of 30lbs. weight, but the large ones are not as common now as they were fifty years ago. Your jack is called pickerel in the North, but there they misapply that name to the pike also. But what I tell you about the weights of these fish is true."

"That reminds me," said Capt. Jack, "that last year I had a passenger who said that they took a jack in a net at Point Pleasant, where the Kanawha comes into the Ohio, that weighed 16lbs., and I know that there are no jack in the Kanawha, for I've fished it from Dublin, on New River, to Point Pleasant. I told him that there are no jack west of the Alleghenies, for I've fished the Big Sandy and all the principal rivers on that side; but if he was correct, it must have been one of your big Northern fish that had somehow strayed from the fold."

Mr. Mosely asked if this could be possible, and I told him that one of the big pikes was occasionally taken in waters in the Ohio Valley. At that time I did not know of which species, but have since learned that it is an unspotted mascalunge.

By invitation of Mr. Mosely, Capt. Yeatman would fish with us, and early on the second morning we hired three darkies with boats to take us down to where Butler's Dutch Gap Canal and the James River met. "Here," said Mr. Mosely, "we will try for chub and jack. If you catch any you may call them black bass and pickerel, but we'll stick to the old Virginia names for a while, until the spread of angling literature has its effect on a younger generation."

We fished, lunched and fished until it was time for the darkies to resume the oars and row up stream. They had partly drifted down and had slept, or pretended to sleep, all day, and now they were to earn their money. They kept the boats alongside so that we could talk on the way up the canal, and Capt. Yeatman was disposed

to get my views on the strategic value of the canal which Gen. Butler cut in order to leave Richmond, an inland city, a few miles back from the river, but which is now used by boats to cut off miles of travel to the State capital.

Said I: "Capt. Jack, in cutting this canal Gen. Butler did not hurt the Confederacy a little bit, but he saved many catfish, then unhatched, many miles of laborious swim, and if they had speech they, or their descendants, would rise up and call him blessed."

We had a good catch of black bass, something like a dozen pickerel, and some perch and other fishes. Mr. Mosely had absorbed enough of modern ichthyology to distinguish the two black basses. I say modern ichthyology because it was shortly after the time when Dr. Gill had brought order out of chaos and condensed the many nominal species into two; and I can never forgive Mr. Mosely for writing to FOREST AND STREAM that the big mouth was a "vulgarian." The word was new to me and to others, but it "took," and that slanderous remark rests on a good game fish to-day. Dr. Henshall and I have fought this prejudice, but it seems to be fated to remain, and it probably will remain as long as one species of black bass appears on the statute books of New York as "Oswego bass." At an early day I will say more about this abominable misnomer.

Mr. Alexander Mosely was a bachelor, and slept above his editorial rooms, where I saw his collection of rods and pipes, but he had a dinner fit for anglers prepared for us at a café, and shortly afterward sent me a rare collection of pipes from the roots of Virginia laurel, or rhododendron, and of "bamboo," which I think is known as "cat brier" in New York, and the bundle of stems included "seven-barks" and other woods which are supposed to impart more or less flavor, or coolness, to "the weed of Ole Virginny."

Because Mr. Mosely died a few years after this fishing trip, and Capt. Yeatman followed him a dozen years later, it is not fair to infer that I am a hoodoo, because there are men now living that I fished with, and among them is Col. Charles H. Raymond, of New York, with whom I fished in A. D. 1840, and he is taking salmon and shooting ducks when the time comes to do those things, and seems likely to continue these practices indefinitely.

From Lynchburg up to Lexington was a bit of most delightful travel. It was "slack water navigation," which meant that the river was dammed and used as a canal. We slept peacefully at night, after leaving Lynchburg, if the boat did not bump too heavily in the locks, but in the morning there was some three hours on deck, after breakfast, winding among the mountains, the musical horn blowing for the locks and the mist which partly concealed and partly revealed the next turn in the river and brought startled water fowl suddenly in view. * * *

But there is a railroad there to-day. Will there be any pleasure in travel, for travel's sake, in the next century?

Dr. Robertson, of Lynchburg, was the head of the State Fish Commission then, and I had to run down from Lexington to consult with him about the stream where the quinnat salmon fry should be planted, for this was my order from Prof. Baird. Dr. Robertson was a bachelor who had not the slightest element of humor in his make-up. He was a most excellent man, but to me he was, as the diplomats say, "persona non grata," and my frequent visits to Lynchburg ended in Capt. Jack Yeatman's office, if he was in town, for there was cheerfulness and sunshine. One day the Captain showed me a rod of his own make which was at least original. It was a whole cane, except the extreme top, and just above the upper reel-band he had tunneled into it and then burned out the partitions which occur at the joints, and had put a ferule on the tip to keep it from splitting.

"There," said he "is a rod that will have an even strain along its whole length, and not on outside rings where the line makes the chord of an arc when the rod bends. Now, I've tried the line to the stove-leg; take hold of the rod, and note the spring of it."

I tried, walked back and felt the line go through the rod, and remarked: "That's an excellent rod for one thing."

"What's that?"

"For encouraging the trade in fishing lines. Did you ever use it?"

"No, only finished it a few days ago; I don't know that I understand you exactly."

"I thought you hadn't used it. Take hold of it, and put a strain on the rod, and walk backward and feel the line run through."

He did this, and said: "I thought I had it smooth inside, but it isn't."

"No, and I doubt if it can be made smooth; see here," and I picked some fine particles that came from the rod off the floor and showed him more in the line, which was a good cable-laid linen one which was entitled to better treatment. "If the inside of the cane was of enamel, like the outside," I added, "the line would run smoothly, but would probably wear more than it does in rings or in standing guides, especially if the latter were agate lined."

He thought a moment before he said: "I wonder if a little thin varnish poured through wouldn't keep the soft fibres close? Probably not. Well, that's not the first original idea that flattened out, but I don't know but it might be done with some close-grained wood, like greenheart or lancewood; I'll think this over." *

During the building of the hatchery and the troughs and trays, I had quite a picnic either with the cadets in the Military Institute at Lexington, or swapping yarns with Capt. Yeatman. At the Institute there was much of interest beside the drills and dress parades. Here Stonewall Jackson had been Professor of Physics and Artillery Instructor, after his service in the Mexican War, and Col. Marshall McDonald, Jackson's chief of engineers, was then an instructor and was afterward United States Fish Commissioner. He was my pupil in fish-culture. He seemed entirely devoid of humor; but when all was ready and the great, handsome eggs of the quinnat

* I don't know whether Capt. Yeatman followed this up or not; it was a pet idea with him because it was his own. The tubular rod was made in steel some dozen years ago, but was abandoned, the friction being too great.

nat salmon came, a full quarter of an inch in diameter, and highly colored, McDonald watched the opening of the cases, the thermometer tests, and the final deposit in the troughs; then, gathering a handful and putting them in a newspaper, he said to me: "Come along."

He passed "Old Specs" without remark, but we went into "Old Gimlet's room," where that individual was in conversation with ex-Governor Letcher, the old "war Governor." The cadets at Virginia's great military academy are not more respectful than boys in the rest of the world, and Gen. Smith, the superintendent, wore glasses, and hence was "Old Specs." For some reason, now forgotten, every surgeon at the post, for years back, was "Old Gimlet." I had become well acquainted with the Governor, had taken lemonade, mint tea and peach and honey at his house, but I had no idea what McDonald was up to until he said: "Doctor, try this new kind of currant we've been raising. Governor, have some."

The Doctor and the Governor both took them in their hands. They were large, cool, and looked inviting. As the Doctor put his in his mouth Gov. Letcher must have seen something in my eye, for he paused long enough to see the effect on the Doctor, and to hear his remarks. The Governor passed.

Those disrespectful cadets! They would come into my room, sometimes a dozen, and say: "Old Yank" (I was then forty-two), "we have just dropped in to have a sociable smoke with you and listen to your chirp. Ah, thank you; your tobacco is always good." Or a single one would drop in and remark: "Gen. Yank, you flatter yourself that you can play a fair game of chess, and I thought I'd drop in and knock that conceit out of you."

Sometimes the cadet went off a victor, but it was not a grand victory, because the game is the only one I love. I am only a duffer at it. But I loved many of those boys, and thought how eagerly their predecessors of a little over a dozen years before had sprung to serve their State, and were cut down at New Market, if that is the place where some of the finest of Virginia's youth fell. The boys all knew that I had fought on the other side; I would despise myself to conceal that anywhere, and they seemed pleased to learn that I did not object to being called "Yank"; and so we got on in good shape, and if there was a little fight to be settled with fists under the hill, "man fashion," I always got notice in time to be there. The authorities winked at it, if they heard of it, for most men agree that this is the best way for boys to settle all grievances. If the trouble was between boys where the disparity in size forbade a settlement in this way, the smaller could readily find a knight to take his place who had the requisite avoirdupois to make the contest an equal thing at the start. This is the rule at West Point and in the German academies. I believe in fighting, and enjoyed the "scraps" under the hill. War is the natural state of man, as all history, Biblical and other, shows; and a boy who is a coward has no standing among boys, no matter how he may stand in his classes. Malthus said that a war was a necessity every thirty years, in order to kill off the surplus males and so keep the world from over-population and pestilence and plague. I agree with him, although I have considered the opposite theory that war carries off the strong men, while famine and pestilence take only the weak. But the fact remains that immigration from over-populated Europe has built cities, States and Territories in America, where the wolf should howl and the buffalo should range on land that should be left for our children's children for the next ten thousand years!

This is entirely in line with the policy of FOREST AND STREAM in the preservation of game for men yet to be born. We may use what nature offers us; but it is ours in trust. We may not destroy in order to increase personal gains, but we should ever remember that our sons will come after. These are the thoughts which a recollection of the cadets' fistic battles under the hill have brought up. It is natural to fight. Boys love to snowball and to storm a snow fort, and the play of all young animals is a mimic combat. When the Peace Society succeeds in changing the whole nature of man, war will cease, and the great nations will not descend on helpless China and divide her, as they are doing to-day, because she has neither an army nor a navy worth mentioning.

Capt. Yeatman one day said to me: "You seem to pay a great deal of attention to the darkies that go along the street, and just now you left your chair to watch one go by on the other side of the street. What interests you so in them?"

"I see more quaint character than—no, not than you do, but, to put it correctly, I am more impressed with it than you are, who have been brought up among it. The darkies of the North have not the careless abandon and ragged picturesqueness that they have here, and it is a treat to me to see them. Before I came South I thought the old-time minstrels exaggerated the negro, but that long, lanky man who just passed would have been a model for Dave Reed or Nelse Seymour."

"Who was Dave Reed—an artist?"

"Yes, artist enough to draw \$100 per night from Bryant's Minstrels, in New York, for a ten-minute act—singing:

"Sally come up,
Sally come down,
Sally come twist yo' heel aroun'.
De ole man, he's gone to town;
O, Sally, come down de' middle."

Not much in the way of poetry, nor music, but there was much in Reed's long legs and the way he did that chorus. The darky who just passed had Reed's trick of dropping his hip that others tried, and as I watched him go up the street just now I could imagine that he was doing the 'Sally, come up' act."

"I see; you like that sort of thing; I wondered what you copied that darky's motions for."

"Well, if I did follow them it was involuntary, and perhaps I was doing the act mentally. By the way, there was a man from somewhere in Virginia who invented the banjo, or at least put the thumb-string on it, and he came to my native town with a circus and played and sang in the ring, and he taught me to play a little, for I was wild over it and sought him out. He had a song

about Lynchburg. The chorus stated that he was 'gwine down to Lynchburg town, to tote my 'bacca down dar.' One verse went:

"De ole Jeems Ribber I float down,
I run my 'bacca boat agroun';
De drif' log cum wid a rush an' a din
An' stove bofe ends of my ole boat in.
But it'll neber do to gib it up so,' etc.

He came to Albany for three years, and I was with him every minute that he allowed me. That was about 1846-48, when I was thirteen to fifteen years old. His name was Jo Sweeny."

"Well, well!" said Capt. Jack, "so you knew 'Old Jo' Sweeny! He was a native of Virginia, about Appomattox, and he and his brother Richard both died in 1860. There was another brother—and they were all banjoists—who was somehow connected with Gen. J. E. B. Stuart; but whether as an entertainer or a staff officer I don't know."

This explained why a letter to Jo Sweeny, in care of Gen. Jubal A. Early, C. S. A., was not answered; as a prisoner taken at Spottsylvania who stopped to listen to the banjo of Color Sergt. George Drysdale, of my regiment, expressed himself to the effect that if he wanted to hear real banjo playing he should hear Sweeny, etc.; and by the time Drysdale told it to me there was a change in the personnel. Gen. Stuart was killed in 1864, about the time I heard that Sweeny was with him, and it is not to be wondered at that my letters from Confederate prisons, some two months later, were not answered:

"Capt. Jack," said I, "one of the grandest musical treats of my life was at a corn-husking near Burkville, Va., in the fall of 1865. Most men have a taste for music of some kind, and as a sort of retaliation for your observation on my watching Southern darkies I will tell you that I have heard you humming, or whistling, 'My Old Kentucky Home' and 'Way Down on de Swanee Ribber,' and therefore know that you are possessed of both melody and rhythm, which comprises all there is of music to my ear. The harmony of an operatic chorus is wasted on me."

The Captain thought a moment, and replied: "You are fond of the songs of birds; they sing without rhythm."

"Perhaps so, but with melody."

"Ever hear a catfish sing?"

"I've heard the sounds they make when pulled out of the water with a hook in the mouth, if that's what you mean."

"Just so," said the Captain; "we will hear some of them sing in about an hour." And we did, as well as some horned dace which the Captain called roach. I took some of these, and perhaps the fall fish also, at Lexington. I refer to the two species of *Semotilus*, which I could not well distinguish in those days.

My friend Judge A. K. Leake, of Virginia, told me this story: "Upon my father's plantation, in the long bygone days, was an old superannuated negro whom we called 'Uncle Phil Hatcher,' to distinguish him from another Phil on the place. Old Uncle Phil's working days were over; he had 'laid down de shubble an' de hoe,' and was allowed to pass his declining days in any manner that pleased him, which was in fishing if the weather was right; but on cold, rainy days when he had 'roomatics in his laigs an' de misery pains in his back,' he was to be found close by the stove in an outhouse which was used as a kitchen for the 'hands,' in which his sister, old Aunt Milly, reigned supreme as the cook.

"He had a genius for fishing that probably was born with him, and the scenes of his exploits were a large creek and a mill pond, both on the plantation, and at the mouth of the creek where it empties into the James River. In my early boyhood the holidays were doubly welcome if the weather permitted Uncle Phil to fish, and I could accompany him. He was remarkably successful, and it seemed as if the fish refrained from taking others' hooks in order to sample Uncle Phil's bait. It made no difference if he baited my hooks; he would catch a dozen to my one, and big ones at that. His tackle consisted of a strong cotton line, spun and twisted on the place; an ordinary sized hook, a float made by him out of the soft root of the ash, and a cedar rod cut and peeled when the sap was running up.

"The fish he would catch—using our local nomenclature—were Southern chub (black bass), pike, silver perch, carp and flatback. The two last named would bite from February to April and from October to January. I have never seen these fish elsewhere than in the waters of the Piedmont section of Virginia, and do not know their scientific names. Both have the small, round, sucker mouth, and in cold weather are very good eating. The carp is a rather flat fish, with large fins, a sharp back and large silvery scales. The flatback is a round fish with small dark scales on the back and sides. You will recognize the other kinds. There were other fish in these streams, sun and yellow perch, mullet, white chub, catfish, etc.; but the fish just named were the only ones that Uncle Phil deemed worthy of his steel, and he looked with undisguised contempt on the silk lines and painted corks which I had. He lived and died in blissful ignorance, no doubt, of such an art as fly-fishing.

"His invariable bait for carp and flatback was cornmeal dough, mixed with cotton, and put on the hook in shape of a ball as large as a buckshot, while for the other fish he used live minnows. He lived to a great old age, delighted in a 'chaw' of tobacco, and there is no record of his ever refusing a drink of whisky. If he ever did such a thing, it must have been many long years before my advent.

"Apropos of his taste for 'nutritious beverages,' on one occasion when we were fishing near an old mill of my grandfather's he pointed out the site of an old distillery where, he said, my grandfather made excellent whisky, apple and peach brandy, and he could, in those good old days, get a drink as often as he wanted one.

"Dey was de good ole times," said Uncle Phil; "dey don' neber come no mo'; it was worf while fo' to lib in dem days, 'deed it was, an' yo' gran'fader—well, dey don' seem to make men like him now days; an' he made good whisky too—not such stuff as dey makes now. Hole on, I got a bite—nuffin' but a little sun perch,

an' no 'count. But yo' gran'fader get along fus trate tell bimeby ole Gen'l Coke he cum 'long. Ole Gen'l Coke he one dem temp'rance men, an' he talk an' talk till yo' gran'fader actilly jine de temp'rance. He was a-gitten along in years, an' I 'spects his mine was a little 'sturbed, an' he neber do a t'ing like dat. But ole Mahstah he jine, an' he neber had any mo' health; he jes' pine away an' die."

Judge Leake and I had been fighting our battles over again in that fraternal spirit which the true American soldier shows when he meets a fair, manly opponent, and I remarked: "My dear Colonel" (he has forbidden me to address him by the military title which he should be entitled to as an ordnance officer in A. P. Hill's Corps, Army of Northern Virginia, and so I will say no more on that subject)—"my dear Colonel," I replied, "what you say reminds me of two stories, and they run in this way. A Northern traveler in Kentucky asked a darky: 'Whose large house is that?'"

"Keyurnal Johnson's, sah."

"Do you happen to know with what corps Col. Johnson served during the war?"

"No, sah; the Keyurnal didn't git into de wah; he was too young. He was bawnd a Keyurnal, sah!"

"Judge," said I, "that story represents the Northern idea of the Southern gentleman. At thirty he is a captain (there is no lower grade); at forty he is a major; at fifty a colonel; and then he is a general, ten years later—that is, if he is a man of prominence in his community. In the North the tendency was to drop them after the war, unless a man was a real, sure-enough general; but as the war veterans get older there is a disposition to revive military titles. But I'll tell you a story:

"What your old darky, 'Uncle Phil,' said about your grandfather 'j'inin' de temp'rance' recalls a story of a New Yorker who visited a Virginia gentleman, and seeing mint growing in profusion, proceeded to make his host acquainted with the flavor of a mint julep. Many pleasant days passed, and the traveler went his way; but a few years after he found himself near the old plantation, and inquired for the proprietor. An old darky came to the door and said: 'De young Maas Brown he dun gone off awn a deer hunt, an' de ole maas he gone daid.'"

"Dead! Sorry to hear that. What did he die of?"

"He was livin' 'long fus rate till a Yankee cum down yeah an' teach him to drink grass in hees rum, an' he died; I 'spect dat'll kill anybody, sah."

Fishing Up and Down the Potomac.

The Eastern Branch.

NOTHING perhaps so impresses one who wanders up and down the Potomac as the abundant evidences of a hundred years of nature's forces in the filling in of by-gone channels.

Whether there is really much less water than formerly is doubtful. At any rate in the lower river the tides must rise to their accustomed level, but everywhere in the tidewater creeks, where history and legend tell of former channels and commerce, we find to-day mud instead of water, and an occasional scow instead of busy ships. The Eastern Branch is one of these, and in Revolutionary times Bladensburg was the head of navigation. Now one may hardly reach Bladensburg with a canoe at low tide, and a channel is only maintained by dredging as far as the Navy Yard.

The upper end of the branch is principally wild rice, cattails and other aquatic plants that cover a swamp of considerable extent, and where at high tide in the season fine reed bird and sora shooting may be found.

The lower end is a wide expanse of mud flats, showing here and there decayed stumps of piles and wharves and wrecks. It is not a thing of beauty at either end, but so much depends on the point of view. Many a man has come away from it with a string of ducks or fish or rice birds or ortolan, as the rail is misnamed here, and thought it one of the most pleasant resorts in the country.

A book might be written of the century of associations which cluster around its banks, from the entry of the British into Washington, through Bladensburg, the old dueling ground when the code was the law among gentlemen; past Benning's, the great natural game preserve and sporting resort in later days; past the ruins of the old bridge, over which Booth rode at midnight while a nation wept; past the Navy Yard—busy once in the building of wooden ships, busier now in the manufacture of the greatest steel ordnance in the world; past Buzzard's Point, with its unsavory recollections, to the Arsenal at the point, more a playground for the city than a point of defense. But we came to fish.

The marshy character of the low banks and the ever-changing tides make a boat almost a necessity, though many fish are sometimes caught from the bridges and the rude wharves.

Three or four boat houses near the Navy Yard bridge furnish boats at moderate prices, and the direction we are to take depends something on the tides and something on what the angler seeks.

Up the creek on the further side are great beds of the wankapins, or little yellow waterlily, and in these, especially at low water, it is easy to find great numbers of the sunfish, or tobacco box, as this pugnacious little fish is locally called, and with a 102. rod they afford first-rate amusement. As a rule eight years is the limit of enjoyment for this sport, but children of a larger growth have found them attractive and were not ashamed to acknowledge the weakness.

"Everybody knows the sunfish, bold in biting and fearlessly fighting to the last on the hook. On fine tackle they give quite good sport; and I have frequently quit fishing for large-mouthed bass and pickerel in some warm water lake in summer because I preferred taking the bold biting and voracious sunfish." Thus wrote J. Harrington Keene; but then he was writing for boys, and was rightfully encouraging their probable sport. It is perfectly fair to guess that when he left off fishing for bass and pickerel they were not rising well, and the latter probably not at all in warm water. They have a bad habit of disappearing when the thermometer rises.

About the piers of the high bridge that extends to Pennsylvania avenue, a half mile above the boat house,

are schools of white perch, and indeed these may be caught almost throughout the course of the stream. In the upper shallows a good many carp, catfish and eels are taken by the natives, who know something of their haunts and habits. A stranger would grow weary trying to find a carp, notwithstanding their plenty.

Just above the bridge the Pennsylvania Railroad crosses a low trestle, overlooked by the Congressional Cemetery, and beyond this the flats were formerly known as Lickin's, and most fishermen started from here for their day's sport. Still further up are three islands, known in commercial days as Thoroughfares Nos. 1, 2 and 3. The course of the canal boats, which were poled from the canal in Washington with supplies for Bladensburg up this channel, depended on the state of the tides. At high tide the boats made a short cut behind the islands, but at low water threaded their tortuous way around. One of these boats lost its captain, and his widow Peg managed the boat for several years, but she too in an unlucky moment fell off her unwieldy craft and never rose again. This spot is still called Peg's Hole, and is said to then have had a depth of 40ft.

From this place, as far as one may go with a boat, club or fall fish may be found by one careful enough for this wary fish. In deep water any one can get them with bait, but the angler who can coax them to the surface, where they can take a look around, and keep them there long enough to take the fly is already a pretty fair fisherman.

Tall waving ribbon grass that hardly shows at high tide packs down into solid looking flats at low water, through which it is difficult to work a boat; but just along the edges of the channel this grass is favorite cover for the perches—white, yellow and sun.

Opposite and below the Navy Yard white perch are plenty, and about the timbers of a couple of old wrecks nearly sunk in the mud we have found them of first-rate size, though for the most part the deep-water bait-fishing takes a larger average in weight at any hour before dark. From then until 10 or 11 o'clock, if the tide is right, the fly will take the largest in the neighborhood. The reason is to be found in their natural shyness and the neglect of the angler to take sufficient precautions. There are places and times and conditions when 6ft. of rod and only as much of line will catch perch as fast as they can be unhooked, but for the most part to fish "far and fine" is as much better in perch fishing as for trout, especially if one fishes the same water long. You get the stupid ones caught out after a while, and those which have been pricked learn caution, as does all life from danger; and the plebeian perch is no slower about it than his fellow citizen with a longer pedigree and more gorgeous coat of arms.

The flats at the mouth of the Eastern Branch have long been a favorite seining ground, as have all the broad openings off the river front, like Gravelly Run at the south end of Long Bridge, Four-Mile Run, etc. These fishermen, some of whom live in house boats on the river, have set nets and seines, and have worried the authorities and anglers not a little.

Some of the fish they are catching now are already heavy with spawn, as yellow perch. A good many fish too are taken called by these seiners capital fish, nearly golbs. being caught at a single haul on the 11th inst. These are like the goldfish in general build, but silvery in color, and are apparently a deterioration of the Chinese carplet. The Potomac has a great many goldfish, descendants of stock escaped from Washington ponds and aquariums, and these of fairly good color and as large as the golden ide may be often seen in the waters below the city. This capital fish may be a decadent, the color modified by changed conditions of sunlight and muddy water and feed. Though eaten they are not considered delicacies, and as they do not readily take the hook are of no interest to sportsmen, save as a possible supply of food for better fish. If the seiners did no other harm than to remove these there would be but little opposition to their depredations. But when they are reported as hauling their seines to the shore and leaving the small fish to die on the gravel, using them afterward, if at all, for fertilizer, anglers grow frantic; some of them incoherent.

Efforts are being made to prevent this destruction in the District, but the press reports that on the trial of one the other day his defense was that the law only forbid such seining in the Potomac, and though the information located the offense in the Eastern Branch of the Potomac it was in reality Anacostia River, and an old map, on which the Eastern Branch bore that name, was supposed to fortify that position. If the alleged offense had been committed in the main stream it would probably be considered a sufficient defense to exhibit an older map, on which the Potomac is Pot-o-wam-meck, to let a culprit go "unwhipped of justice."

The case is still pending, and it is to be hoped the defendant is innocent of any violation either in Anacostia or the Eastern Branch. One thing only is sure, Eastern Branch it has been for a hundred years and Eastern Branch it will remain. These fishermen who depend on their nets for a livelihood cannot understand the antagonism of the sportsmen. They think he desires to rob them of their hard-earned chance to get bread and butter; that fish in tide waters ought to be free; and that it is only another instance of the oppression to which the rich are always subjecting the poor. In this he is mistaken. The anglers who feel most the effect of the havoc wrought by these illegal nets are themselves poor. The well-to-do sportsman takes his outing at a distance, and goes to waters where the fishing is different. Most of them indeed have a contempt for anything but a trout or a salmon, and they have as much trouble as the man with the nets in understanding anybody's objections if all the fish in the neighborhood were taken. Even as fertilizer is better than no use at all, and they haven't the slightest use for the little fishes.

But the clerk and the laborer, whose means and duties will not permit him to leave the city save for a few hours at a time, and who needs these hours in God's sunshine worse than any, these are the people who are hurt, to say nothing of the thousands of boys who have some rights to a nearby place to cast a line, and the still poorer, whose only chance for a bit of fish is of their own capture.

The legitimate netting is not objected to. The hard-earned pittance of the toiling fisher in the wet and mud

is not begrudged. He has sympathy instead for all this, and the absurd prices he must accept for the small fish turned in. It is only when he breaks the law, not only as it is written, but the laws of humanity and decency, in the wanton destruction of the ripe fish and tiny fry; when he throws these upon the sands to die, or on the fields, that the lover of the rod waxes indignant and denounces the class and the business in terms perhaps too general. Then the netter gets indignant and says that if Sunday angling could be restrained fishing would get good again. Who can blame him? Yet one haul of his net may work more destruction to next year's supply than all the anglers here may do in a season.

If the seine hauler would only show some consideration, ever once return the useless fish, the babies, to the water, better relations might be established, and his own chances of prosperity increased. One trouble lies in education. He has been taught to drag his net to shore, and knows no other way; if he would lift his net in the shallow water and turn it over after culling he would get more sympathy and less abuse, but we cannot forgive the destroying of the little ones.

At the bridge across the Eastern Branch, just above the Navy Yard, many rock fish are caught, and of good size, by the light of the bridge lamps on summer nights, when the May fly is out and the tide is flood about 10 P. M.

Nearly any sunny summer day with a fly first-rate sport may be had in and out among the numerous piers by quietly stealing along with a light skiff and throwing your fly around the corners. When the water is clear and the tide runs swift these shadows are favorite shelters for rockfish, perch and sunfish. But when the nose of your skiff reaches an opening the fish are gone. It is sometimes tantalizing, but this is always a part, and a principal part, of the pleasures of the chase.

HENRY TALBOTT.

An Invitation to Angling.

Editor *Forest and Stream*:

In these days, while we are yet surrounded by the evidences of the eccentricity of the earth's orbit, as well as that of "Old Probs," there comes now and then a balmy day suggestive of the approach of spring. Ah, yes; the coming of spring, with its promises of flowers and fishing, makes the pleasures of hope to dim even those of pleasant memories. Once more my heart, like that of the Psalmist, "panteth for the water brooks"—for the freedom of the primeval forest and its balsamic odors—the murmurous music of the pines—the Rembrandt lights and shadows of the camp-fire by night—the mysterious cry from the sylvan shades, as the ghost-like owl

Hoots his melancholy lay
Away, in the twilight soft and gray.

—the loon's weird nocturnal laughter from the lake—the drowsy perfume of the bed of balsam boughs and the soul-subduing lullaby of summer showers.

I am blessed with a brother-in-law who is an Episcopal clergyman; and who is withal a thoroughly good fellow in every respect, and especially as a companion for an outing. His particular delight is like that of the elegant piscatorial poet of your own city, to escape intramural monotony; and with that author's "Little Rivers," Fred Mather's "Men I Have Fished With," Rowland Robinson's "Uncle Lisha's Outing," Thoreau's works, and a few more of that sort of literature, to "flee into the mountains of Hepsidam." He is of large and imposing presence, and I have not inappropriately dubbed him "The Bishop"; and my pious aspiration is that he may yet wear the lawn with all the dignity and grace which is native to him. I have recently written him a letter on the subject so dear to both our hearts; and as it may interest your readers to speculate upon their own feelings, had they been the recipients instead. I will venture to insert it:

"My dear Bishop:

"Lo, many revolving years have shed their blossoms of beauty and their snowdrifts of sorrow upon our heads since I first began our correspondence on the subject of vacations in the wilderness; but bearing in mind my recent remissness in this respect, I now approach thy pontifical presence with due humility, having a lively appreciation of my penitential position as regards your hierarchical highness of the miter. Speaking of bishops and miters, I never see a picture of one of those episcopal monstrosities, looking like an absurd pineapple cheese with a long, acute wedge taken out of its top, without being tempted to call bishops 'split-heads,' from the form of the chessman of that name.

"Well, my dear old 'split-head,' I understand that you have recently been suffering with the premonitory symptoms of the Waltonian fever. No, I will not call it Waltonian, for the much belauded old duffer from whose name the adjective was constructed was not my kind of a fisherman. Nay, don't hold up your hands in holy horror; I know that you are bound by your birthright as an Englishman to venerate all that pertains to that home of the oldest civilization on earth; and generally speaking, I am with you; but I draw the line at Izaak. That delightfully innocent old manufacturer of golf stockings never really 'went fishing,' in the sense that we use the phrase. He was simply hampered by his natural environment; and his little 'pent-up Utica' compelled him to be merely an amiable and harmless old crank who liked to hear himself lecture on natural theology, while his clumsy old 'pole' was stuck into a claybank, as his float bobbed peacefully up and down on the placid waters.

"When his didactic discourse had been duly delivered, and the doxology sung, this tired and tiresome old gentleman would excavate the butt of his rod from the bank, haul up the float which had been submerged unnoticed for perhaps two hours, hoist up a mud-flavored carp or tench—Heaven save the mark—and then proceed to inflict upon his gasping and wondering companion and victim a recipe for disguising the beastly taste of his captured water-hog; all of this being couched in florid and pedantic phrase fit only to stuff his fraudulent fish with. Oh, yes, I am a 'disciple of Walton'—I don't think. Why, bless your apostolic eyes and limbs, if the ghost of old Izaak should rise in the gloaming, on a lake in northern Wisconsin, and seat itself in my boat, I would furnish that beneficent and silly old shade with

a 5oz. split-bamboo, an automatic reel, a fine braided silk line, and a lively creek chub for a lure; and when a 3lb. small-mouth struck him, that unfortunate old spook would get right up and howl, and frankly admit, then and there, that while in the flesh he didn't know the first principles of 'goin' a-fishin'.

"After this long exordium it is perhaps unnecessary for me to add that I too want to go fishing; and I want some one for a companion—somebody who is companionable, and not quite as expert as myself, for I do not wish deliberately to wound my own self-esteem; and after canvassing the list of my eligible acquaintances I have concluded that you will fill the bill elegantly. And now, if you will consent to bear with your usual patience the peculiarities (to use no worse name for 'em) of a tolerably rough and careless old boy who delights to dabble in water, catch the various denizens thereof, smoke a corn-cob pipe and write sentimental verses about fish and females—or, combining the two, 'mermaids'—if you can stand that kind of a combination another trip, suppose we talk the matter over and arrange for an outing whenever your 'parochial' duties will permit. Apropos of fishing and versification, *FOREST AND STREAM* has honored my muse by publishing my song of the 'Kentucky Reel,' which seemed to have met with your Reverence's approval when I sent it to you. Permit me to make my acknowledgments for your high encomium upon my effort; and inasmuch as you suggest that I should 'strike the lyre again,' presuming that you mean that I should 'hit the same old fish liar again,' I will take you at your word and proceed to reach for his solar plexus thusly:

A SUNSET IN SUMMER

'Tis a sunset in summer, and fold upon fold
Glow the clouds in their draping of scarlet and gold
And the bright dimpled waters are sinking to rest,
Lulled to sleep by the breeze breathing out of the west.

The oars are abandoned—we gaze with rapt eyes
On the occident mantling with exquisite dyes,
As the pearl and the amethyst mingle their glow
With the turquoise and ruby that glitter below.

So we drift as we watch the magnificent sight
Of the rich tints evoked by the magic of light;
Until nearing the shore, when, as quick as a flash,
The picture's forgotten—there's a musical splash

Of a bass, as he leaps from his watery lair,
Flinging glittering drops on the soft summer air.
The boatman, in warning, gently raises his hand,
And points to the circlets just kissing the land.

Then deftly he hooks on a minnow with care,
And whispers: "Now make a cast just over there."
When away flies the lure with such delicate skill
As scarcely to ripple the waters so still.

A moment of waiting, then a tentative bite.
And the fish steals away with a motion so slight
I can hear my heart beat. Ah! the thrill that I feel
As the silk slowly glides from the low clicking reel.

Now he halts, and I strike—a magnificent jump—
And my heart in response gives a rattling thump;
For my bass is a beauty—what are gorgeous skies
To the bronze and the pearl of an angler's prize?

"There, no matter if the poetry isn't up to grade, just give it the stamp of your approval, and like Horace's head my old bald pate will scrape the welkin. Just think what that celebrated Brooklyn divine did for a no less celebrated brand of soap; and reflect what a proud thing it will be to you in after life to boast that you discovered and encouraged a struggling fish poet. Your own reputation will doubtless be enhanced, and your glory be gilded by the dazzling coruscations which will light my pathway to Parnassus.

"Oh, yes, Fred; you work up a little favorable sentiment in my behalf—make 'em believe that in our gas factory we manufacture the genuine afflatus, and that I am the high priest of the cult—and at the risk of my reputation I will try and convince the people that you are an eloquent preacher, ram jam full of unuttered eloquence, silver-tongued oratory, soulful syllogisms, etc.; and the first thing you know, your pet name of Bishop will no longer be a mere pseudonym, but a bona fide title. Is it a whiz?
"As ever, your brother angler, ZERO."

Boys vs. Hoodlums.

CHARLESTOWN, N. H., Feb. 28.—*Editor Forest and Stream*: I willingly accept Mt. Tom's apology for misquoting me in regard to the "farmers' boys," although he seems to think it unnecessary, as shown by heading his letter with a quotation from something I did write six years ago, and which bore no more relation to farmers and their boys than it did to the man in the moon!

I spoke of the "inherent cussedness of the ignorant country hoodlum," referring to that class of idle loafers who infest many of our large villages, hanging around the taverns, stables, saloons or billiard rooms, where there are any, working enough at "odd jobs" to support themselves after a fashion, and stretching all laws fearfully, even if they do not break them. Their highest form of amusement seems to be in doing something to annoy more quiet and steady people.

These are the fellows who on the night before the Fourth of July take down the signs of stores and offices, unhinge front gates and hide them, and carry off any stray chairs that may have been left out of doors. The farmer's boy is "not in it" all, and I never thought of him when I wrote.

I have had the padlocks on boat chains smashed with a stone, or the staples wrenched out of the boat, filth left on the seats, and all sorts of other nasty tricks.

Public attention has been called to the growth of this element in our larger villages by crimes of a more serious nature, which seem to be the result of unbounded liberty degenerating into license, and lead one to think that a slight return to the strict discipline of our Puritan ancestors might be advantageous.

The "yellow literature" of the day has something to do with it; police gazettes, with glaring pictures of every crime, and portraits of every murderer; other newspapers whose columns are filled daily with details of all such occurrences, and that mawkish sentimentality

which sends women to the prisons with flowers for the criminals—all are adding a very bad leaven to the lump and bringing about evil results.

The second quotation of the "farmers' boys," as to fishing on Sunday and selling their trout, is also correct; and if the man who kept the hotel here when that was written, in 1894, were still alive, I could prove every word of it. I am glad to say that his successor does not follow this practice.

Now I am neither Pharisee nor Sabbatarian; I believe one day in the week has been set apart for ages for rest and recreation, and although I never fish myself on Sunday, out of deference to general custom, I do not see any such great crime in it as a recreation, but what I did and do object to is making such fishing a labor for gain, and stripping the public waters of their fish on Sunday to pocket the proceeds in cash.

I have a high respect for both the farmers and the farmers' boys, among whom I was born and brought up, and have always been on the best of terms with them, and I did not like being quoted in such a way as to give the impression that I was "cussing" them. I well remember one, who would have made a good "running mate" for that delightful boy of El Comancho's, and who had the same knowledge of woodcraft and wild things and their habits as that delightful boy whose doings I am glad to see chronicled. Nor is Mr. Raymond Spears' boy "a slouch" either. I will bet they are both farmers' boys, every inch of them. VON W.

CHICAGO AND THE WEST.

Along the Rock River.

CHICAGO, Ill., Feb. 19.—Rather a lamentable state of affairs is that set forth by a writer from Rockton, Ill., who wishes to be known as Young Sportsman. It shows very well the depressing feeling which must come to any man who lives in a country once abounding in game, and who witnesses the natural resources of the country decrease from year to year through causes obviously unjust and injurious to the majority of the residents. I may perhaps best present this case by giving a portion of the letter as written:

"I wish to tell you of northern Illinois, at least about the first twenty miles that Rock River flows in Illinois. Here seining, spearing and blowing up fish occur within a quarter of a mile of the town of Rockton, a small, sleepy village of about one thousand souls. Some of the richest farmers hereabout own nets full 200ft. long. They pull these nets generally on Saturday night somewhere between Rockton and Latham. They pull the net till they have got about 300lbs. of fish, then divide up with relatives living within three or four miles of Rock River. When they have picked out what fish they want they don't throw the small bass, catfish, pickerel, pike and perch back, but leave them on the bank of the river by the score. While out hunting I have come to piles of fish bones that if scraped up would fill a half a dozen bushel baskets. I am not stretching this in the least. There are also some pot-hunters here who blow up fish up near the mouth of the Pecatonica River, not a quarter of a mile from Rockton. This part of Rock River was once as good fishing grounds as any one could wish for. There are many fine camping grounds around here, and when fish were plentiful it was a pleasure to go camping for a few days, but now it is as much fun to stay at home. Last summer my chum and I camped eight days, and caught about eighty fish—small black bass, rock bass and silver bass, so small in fact that we only picked out enough of the best to send home a meal apiece and have fish once a day for ourselves, then threw the rest back in the river. Grand spot that!"

"What about the game wardens, fish commissioners? They are the very worst of the lot. If our State officers would pick out a few young fellows like myself, about nineteen years old, who know the country for miles around and don't care whether we are good fellows or not in the eyes of the law breakers, I think we could help them all. Yes, maybe more than they would care to have us. A few years ago a man after working all the week would eat supper, take his pole and a pail of minnows, and go down to some of the river bridges or up to the dam on Saturday night and catch a good mess of fish for Sunday dinner. But alas! no more. Another thing: Fishermen from Beloit come down from Beloit in the spring when it is against the law to fish on their dam and completely cover our dam and bridges, and if we come there to fish we must either fish from boats or in places where the fish don't stay. Why can't our respected law-makers look at this? Wisconsin forbids us to shoot in her territory without a license, but then down in our State—oh, that's different. About prairie chickens, we used to have lots of them, but now these same Beloit fellows and also our Fish Commissioner (?) and several others of our respected "sportsmen" who own dogs commence to hunt about the Fourth of July, and by open season the chickens are so few and far between that a dozen fellows, each going in an opposite direction, wouldn't get a dozen chickens. This in a country that five years ago was alive with game. Rabbits are hunted with a piece of rubber hose, or ferret and shot before they are 20ft. away from their burrow. Squirrels have almost disappeared from this land of ours.

"Can't you help me to form a club of the younger sportsmen that are sportsmen, for the protection of our game laws? I will send you the name of several that are good shots, and along with myself long for the 'shooting of our daddies.' Why don't sportsmen take a hand in politics, put up a sheriff who will help us out? Isn't it breaking the laws just as much to shoot out of season, and shoot, spear and blow up fish as it is to steal? Hoping you will try to interest sportsmen in this matter, I remain

YOUNG SPORTSMAN."

The above correspondent says that he would like this club to be made up of "sportsmen and not of shooters." "By sportsmen," he says "I mean fellows who love the camp-fire. By shooters I mean fellows who go out simply for the shooting. Again I want to ask," says he, "if you consider fellows who own fine dogs, the best of guns and all sportsmen's fixtures, and who go hunting just to have a big drunk, as sportsmen?"

The answers to most of these questions would be easy, and yet they are questions very pertinent even to-day, when the gun and the bottle are no longer considered inseparable, and when the name of sportsman has indeed to be classified apart from that of the shooter. In brief, I will say to the writer of the above that he is happy in being young, for I think he will live long enough to see a better time along the old Rock River. The new ways of sportsmanship and the new ideas of protection gain ground yearly. Providence helps them who help themselves. Let Young Sportsman go ahead and form his club, in which I should be glad to help in any way that I can. Then let the club start out after the violators of the law, not waiting for some one else to do it for them. This week Dr. Bartlett, of the Commission, is looking after some men who have been dynamiting fish under the ice along the lower part of the Rock River. Let us hope he will attend to the men who are injuring the old preserves of our young friend along the upper part of the same stream. I am sure Dr. Bartlett would be able to temperately point out to this writer the wrong of making sweeping and unfounded accusations against the State officers. Get facts, and be sure you are right before you go ahead in a good rule for any young or old sportsman. If you have the facts, no one can shake your position; but get the facts first.

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

The Cheney Darter.

IN an advance publication of the United States Fish Commission Bulletin, giving descriptions of new or little known genera and species of fishes from the United States; by Barton W. Evermann and William C. Kendall, are given results of recent investigations of the United States Fish Commission in Florida, Louisiana and elsewhere, which have resulted in large and important collections of fishes from those regions. The preliminary study which has been given to these collections of fishes from those regions. The preliminary study which has been given to these collections has shown that they contain a number of species new to science, besides several others which have not hitherto been

THE CHENEY DARTER.

taken in the waters of the United States, or are of rare and unusual occurrence within our limits. Among the collections of especial interest which have not yet been fully studied are those made in the St. Lawrence Basin in 1894, in Florida in 1896, and in Louisiana and Mississippi in 1897.

Among the new species figured and described is a darter, from New York waters, which has been named in honor of Mr. A. N. Cheney, "in recognition of his valuable contributions to our knowledge of the food and game fishes" of New York. This is the description of the fish:

Cottogaster cheneyi, new species.

Type, No. 43781, U. S. N. M.; Cotypes, No. 43782, U. S. N. M.; No. 527, U. S. F. C.; and No. 5774, L. S. Jr. Univ. Mus. Length of type, 2 1/4 in. Type locality, Racket River, Norfolk, New York. Collectors, Barton W. Evermann and Barton A. Bean.

Head 4; depth 6; eye 4 in head; snout 4; maxillary 3 1/2; interorbital width 5 1/2. D. XI-12; A. II, 8; scales 7-56-6. Body rather stout, heavy forward, compressed behind; head heavy; mouth moderate, slightly oblique, lower jaw included, maxillary reaching front of pupil; premaxillaries protractile. Cheeks, opercles, breast, and nape entirely naked; scales of body large and strongly etenoid; lateral line complete, straight; median line of belly naked anteriorly, with ordinary scales posteriorly. Fins large; dorsals separated by a space equal to half diameter of eye; origin of spinous dorsal a little nearer origin of soft dorsal than tip of snout; its base about equal to length of head; longest dorsal spine 2 1/2 in head, the outline of the fin gently and regularly rounded; soft dorsal higher than spinous portion, the second to tenth rays about equal in length, scarcely 2 in head, the first, eleventh, and twelfth rays but slightly shorter than the others; anal moderate, its origin under base of third dorsal ray, the spines slender, the second a little longer than the first, whose length is 3/4 in head; longest anal rays about 2-1.5 in head; caudal lunate, the lobes more produced and pointed than usual among darters; pectorals long and pointed, the middle rays longest, about 1-1.6 in head, reaching tips of ventrals; ventrals well separated, not nearly reaching vent, the longest rays 1 1/4 in head.

Color in alcohol, back dark brownish, covered with irregular spots and blotches of darker; side with about eight or nine large dark spots lying on the lateral line; belly pale; top of head dark; snout black; lower jaw and throat dark; a broad black line downward from eye to throat; cheek and opercles rusty; spinous dorsal crossed by a median dark line; ventrals blue black; other fins pale, but dusted with rusty specks.

Fifteen examples of this interesting darter were obtained July 18, 1894, by Messrs. Evermann and Bean in the Racket River near Norfolk, St. Lawrence county, New York. It did not seem to be very common, as only fifteen examples resulted from numerous hauls of the collecting seine.

Named for Mr. A. Nelson Cheney, State Fishcultivist of New York, in recognition of his valuable contributions to our knowledge of the food and game fishes of that State.

Music of the Woods.

PROF. ERNST E. HELD, of Syracuse, N. Y., has found in the Adirondacks inspiration for a series of musical sketches for the piano, entitled "In the Adirondack Mountains." They are intended to give in light outline the impressions received by summer guests during their stay in the mountains, and in the attainment of his purpose the author has been most happily successful. Of the eight numbers, the first is entitled "On the Trail to Camp," in which the melody speaks of the rollicking spirit and joyful anticipations of a party of young men

making their way through the woods. Then, in "Around the Camp-Fire," one of the party tells a story and is answered first by the singing of a quartet and then by many quips, followed by hilarious laughter. Then are heard the "Forest Voices," where rustling leaves and gurgling waters mingle their voices with calls of woodland birds—thrush and whippoorwill—until hushed by the silence of night. Then, with the "Moonlight on the Lake," comes the old, old story, the score picturing a loving couple in a boat on a moonlit mountain lake. The change from this is rapid, but not altogether unpleasant, to the music of the "Trout Stream," in which one hears a mountain brook singing and babbling and gurgling and splashing on its way. The next number interprets the music of "A Rainy Day," where the sound of the rain swishes through the dripping trees and mingles with the sighs and sobs of the imprisoned campers. Then the theme changes and we have the "Deer Hunt," with rollicking music of hounds and shouts of drivers. The final number is a farewell to the woods, in which the score interprets the gratitude, regrets, and vows of fealty of one who reluctantly turns face homeward, and to whom the woods are for a twelvemonths to be but a memory. The music is fittingly inscribed to Hon. A. Judd Northrup, of Syracuse, author of "Camps and Tramps," and one whose devotion to the woods and incorporation of their spirit entitled him to the recognition of such a deduction. The music is published by Theo. Presser, of Philadelphia. It will be sure to please every woodland camper. While specifically named for the Adirondacks, it is universal in the interpretation of the music of nature.

A Spanish Defeat.

From the New York Sun.

"YOU'RE aware that the Canary Islands belong to Spain, but you don't know how widely diffused the feeling against this nation is down there. When I was there in '96 I had a narrow escape from death on that account. After I'd been there for some days I decided on an ocean bath, but I had no bathing suit, and although that garment is not regarded as essential or even usual by the population, I felt that I would be more comfortable

with one on. So I had one made out of an American flag, both for the sake of patriotism, and on account of its buoyancy."

"What buoyancy—the flag's? I never heard—"

"The American flag always floats, don't it? You always hear of it floating. Well, as I'm not a very strong swimmer, I figured that if I got tired the flag would float and float me with it."

"Will you please furnish a diagram with that? The flag doesn't float in water; it floats in air."

"Don't you make the mistake common to inexperience, that diplomacy consists in splitting hairs. Kindly permit me to finish my story. You can take notes as I go along, if you wish, and I'll clear up afterward any points that may be too abstruse for your intellect. To proceed: Adorned with my protecting flag, I swam out into the cove. It so happened that there was a shoal of Spanish mackerel sporting out beyond me. No sooner had they caught sight of my colors than in a frenzy of rage they one and all headed for me, and before I could reach shallow water I was surrounded by the myriads of fish, who attacked me ferociously. With their sharp teeth they tore strips of skin and flesh from me. My blood dyed the water. Escape was impossible. Death seemed imminent. Suddenly I was aware of a terrific commotion in the water about me. The murderous Spanish mackerel ceased to attack me and seemed to be defending themselves as best they could against an aquatic onslaught. Bleeding from a hundred wounds, I made my way to shore. Judge of my amazement and gratitude when I found that I owed my deliverance to the loyalty and courage of a school of starfish and a shoal of striped bass. This combination of stars and stripes, seeing my peril and observing my colors, rallied around the flag, and after a terrific naval battle put the fierce Spanish mackerel to flight. Since then I have never looked upon a pickled starfish or seen striped bass upon a bill of fare that anger and grief have not risen in my bosom."

NOTICE TO SUBSCRIBERS.

The address label on the wrapper shows the date of the close of the term for which the subscription is paid. The receipt of the paper with such dated address label constitutes the subscriber's receipt for money sent to us.

Subscribers are asked to note on the wrapper the date of expiration of subscription; and to remit promptly for renewal, that delays may be avoided.

For prospectus and advertising rates see page iii.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Hydrophobia.

Editor Forest and Stream:

The article upon hydrophobia by Dr. C. H. Sheppard, in your paper of Dec. 11, appears to me the most important upon that subject that I have ever seen. I have frequently read of the Buisson system of treatment by vapor baths, but understood that it had been tried in only a few cases. The results might therefore have been fallacious, for there is always a possibility of mistaking the symptoms due to certain deranged states of the nervous system for real hydrophobia. Such an error could not occur in eighty cases, and if the information as to numbers supplied to the Lancet be fully reliable, there can be no further doubt of the vapor bath being a certain cure. But if so, the fact of its having been ignored since its first trials in 1826 is a decided reproach to the medical profession.

I can corroborate Dr. Sheppard's statement that the saliva of dogs which are apparently healthy may sometimes communicate the disease. One of my intimate friends, an inspecting veterinary surgeon in the Indian Army, knew a man who died from hydrophobia caused by a puppy licking his face where it had been cut while shaving. The puppy showed no after signs of illness. There can, I think, be little doubt that the germs of this and other diseases may exist in the bodies of certain animals which, individually, are not susceptible to their action; and yet the same germs may prove virulent if other animals be inoculated with them. In this way only can we account for a fact stated by Col. Dodge, of the United States Army, in his work on the Great West. He says that skunks are frequently in the habit of nibbling the faces and hands of men sleeping in camps on the prairies. In the Arkansas Valley these bites invariably cause hydrophobia, although they have no ill effects north and south of that belt of territory. When the men awake, the skunks are easily driven out of the tents, showing no signs of being rabid.

I quite agree with those authorities who assert that the virus remains localized for a time in the cicatrix of the wound. It appears to incubate there at first, like the virus of cowpox, before being absorbed into the general system; for the first symptom usually observed, before those which are specially indicative of hydrophobia, is throbbing and itching in the seat of the wound. Many years ago I read in a medical work of two men who had been bitten by a rabid dog, and whose wounds had healed. Some time afterward they felt the characteristic throbbing, and consulted a surgeon, who cut out all the cicatrices, after which they experienced no further ill effects.

There is some reason for believing that rabies may originate spontaneously in animals of the dog genus. It is hardly probable that the disease is always existent in any race of wild creatures, considering how rapidly they die after being attacked, and yet we hear occasionally of isolated cases among wolves in America and Russia, and among jackals in India.

About two years ago a pet dog belonging to an old lady in London died from rabies. He had not been near another dog, and had never been out of the house except into a back yard from which there was no means of egress into the streets. There was no conceivable way in which the dog could have been inoculated, unless he had been bitten by a stray cat, and of that there was not the slightest evidence.

The subject is difficult to decide about, because there are several ways by which the virus may be introduced into an animal's system without any one being aware of the fact. A dog, for instance, might imbibe it when drinking at a pool which had been visited shortly before by a rabid animal. (The popular idea that a mad dog dreads water is incorrect. He will often plunge his face into it for the purpose of quenching his raging thirst, but is unable to drink, owing to spasms and congestion in the throat.) Cats probably communicate rabies much more frequently than is generally suspected, while in its early stages they would be liable to fight with dogs encountered when they climb over walls into gardens and yards. Even when a cat is in an advanced stage of the disease the owner is not likely to detect it, because that animal does not run amuck like a dog, and rarely bites without provocation.

It has been repeatedly stated that there is an excess of cases of hydrophobia found in the vicinity of Pasteur institutes. I believe the cause of this to be that each institute is a center of infection, and that flies are the chief agents in carrying the virus from the wretched animals, in whose bodies it is "cultivated," to healthy dogs and cats in the neighborhood.

There is good reason for the assertion frequently made, that the Pasteur method of treatment often causes hydrophobia in people who might otherwise escape. The late Prof. J. H. Steel, in his book upon disease of the dog, says: "Although intravenous or intracellular inoculation ordinarily produces 'dumb madness,' furious rabies will follow when the amount of virus injected is very small; and the smaller the amount, the more easily is furious rabies brought on." Now, "dumb madness" is that form of the disease in which the patient is paralyzed, and in nearly or quite all the cases of hydrophobia in human beings who have been previously subjected to the Pasteur treatment paralysis has been a marked symptom. But it has been absent, to the best of my recollection, in all the cases caused by dog bites (and not treated by Pasteur's method) of which I have heard or read during the last fifty years.

Rabies (although other diseases are often mistaken for it) is really very uncommon, and there is no exaggeration in stating that a large proportion of dogs entered as "mad" in police returns have been affected with some other malady.

In the Dogs' Home at London the attendants are, of course, sometimes bitten, yet there was not one case of hydrophobia among them during many years after that institution was founded, and I have not heard of one up to the present time. About 40,000 dogs are admitted annually, and Mr. A. J. Sewell, the veterinary surgeon who attends the home regularly, reported that there had not been one case of rabies in it during the twelve months ending March, 1897.

It is asserted by high authorities that not more than, at the utmost, 20 per cent. of human beings bitten by dogs really rabid are attacked with hydrophobia, and this proportion would be immensely reduced if the wounds were without delay carefully cauterized to the bottom. Every bite ought to be cauterized, even if the animal which inflicts it show no sign of illness.

A celebrated canine veterinary surgeon named Youatt, who lived in London about sixty years ago, was bitten by rabid dogs several times, and once through the lower lip by a rabid cat. On each occasion he applied nitrate of silver to the wounds, and suffered nothing further from their effects.

No one should allow a dog, although apparently healthy, to lick any part of his skin. It cannot be too generally known that an unusual degree of affection and fondness for licking is sometimes the very earliest symptom of rabies. Some years ago a case was recorded in England of a lady dying from hydrophobia caused by a lap dog licking a pimple on her face.

The universal muzzling of dogs, so strongly advocated by some authorities, can never completely eradicate rabies as long as that disease exists among wild animals.

A great deal might be done to mitigate its prevalence by:

1. Posting placards in every district, describing its symptoms, and ordering that every animal so affected be immediately confined in a safe place.

2. Enforcing a law that every dog and cat must be registered, and wear a metal collar with his owner's name and address engraved upon it. The police to be at liberty to capture any animal found without a collar and convey it to a dogs' home, where it might be destroyed if not claimed within a specified number of days.

SOUTH DEVON, England.

J. J. MEYRICK.

Reminiscences of Ben Hur.

PHILADELPHIA.—Editor Forest and Stream: Many a man who loves a good dog will be sorry to learn of the recent death of Ben Hur, of Riverview, owned by Mr. Francis G. Taylor, of Philadelphia. The rule which applies to men, "*De mortuis nil nisi bonum*" (of the dead nothing save it be good), might apply also to dogs. At all events, one who reads of the exploits of hunting dogs in the sporting papers must conclude that this rule is applied both to the dead and to the living.

Ben Hur was about ten years old, and consequently was approaching the end of his career as a hunter; but it was my good fortune to have him in the field but a few weeks before his death, and he was as keen and effective as ever. One could have wished for him, in view of his long successful career in the field, that he might have lived out his quiet old age until the dust from which he came took him unto itself again. But it was not so to be. His painful death was due to a careless accident. A bad cut from the heels of a horse led to lockjaw, in spite of every care to prevent it.

The writer presumes that no one had a greater experience with Ben Hur, especially in the field, than himself. For four years he was a daily companion in a summer home in the mountains, and was used very frequently on woodcock and grouse. In the same period the writer was able to make several hunting trips in the South, and only once was Ben Hur left at home; and several times on that trip his steady, valuable work would have been greatly appreciated.

Most dogs are supposed to have their off days, but I never saw one for Ben Hur. If there were any birds about he was sure to find them.

But, lest my great affection for the dog and my high appreciation of his merits should seem to lead me to exaggeration, let me say frankly at the outset that he was by no means a perfect dog. He was rather complimentary to the man with a gun, for whenever a shot was fired Ben assumed that there were dead birds lying about, and it was very difficult to induce him to delay a search for them. He was very self-willed, always seemed to think he knew more about the place to find birds than his handler, and very often demonstrated his superior judgment. But he was very apt to hunt out his own country in his own way. He was not disposed to point birds at long range, and occasionally got so close that they would not keep him company until the guns arrived. In spite of all this, I have yet to see his superior.

The memory retains many incidents of the field. A few of these will show the kind of dog he was. In hunting in close cover no man alive could keep him in sight, nor could any one lose him. Turn and twist as you might, Ben would soon come galloping up your trail, unless he found game; and if he did he would stay until you found him.

I was once hunting woodcock with Ben and one of his offspring. The cover contained about five acres in a long, narrow strip. I lost sight of Ben, and as he didn't come in I knew he had found birds. For thirty minutes by the watch I hunted every foot of that place, as I supposed, repeatedly blowing the whistle and calling loud enough to scare all the birds in the county. Finally I saw the young dog come to a back. I looked ahead of him and saw Ben in tall grass and bushes, as stanch and as unconcerned as if he had but that minute struck the scent. I flushed the bird, and of course did not kill it. I really felt sorry for a bird that had stood for thirty minutes 3 ft. from a dog's nose. I had been repeatedly within 10 ft. of Ben, whistling and calling, but he was concerned about that bird, and thought I was able to take care of myself.

Ben was not quite as fast as many a dog that I have seen, but he could keep up his pace all day, and by his superior judgment frequently wipe the eye of a faster dog. On the last trip I made with him to North Carolina, but a few weeks before his death I found several times that when I discovered him, after a short search,

he was sitting down. I had never seen him strike that attitude when he pointed, though I had seen him crouch in all sorts of attitudes when he came suddenly and unexpectedly upon a single birds at short range; but I could not understand by what process he came to point sitting.

But one day the mystery was explained. He passed out of sight on the brow of a low hill in a large wheat stubble. After waiting some time in vain for him to return I came to the conclusion that he had found birds, and started off to hunt him up. I soon saw him, close by a railroad—perhaps a quarter of a mile away. I turned and called to my companion, some distance in the rear, to follow me. Ben apparently heard me call, and turned his head, by almost imperceptible stages, until he saw me coming; then he moved it back, pointing straight to the covey. When I first saw him he was standing perfectly erect, but as I drew near I perceived that his hindquarters were settling, but very gradually. By the time I reached him he was sitting down composedly, as much as to say: "I am comfortable now, and you ignorant gunners may take your time in reaching the covey." Ben was tired, and did not propose to stand up all the afternoon waiting for people who did not seem to know where the birds were. But, on the other hand, he was cute enough to know that a sudden movement of the head, or a too hasty squatting, would endanger the repose of his quarry, and he intended to hold them until we came, if it were all day.

Let no hunter of a short experience accuse me of misinterpreting the dog's cleverness, for I happen to know that a sudden movement of a pointing dog will flush birds. But recently a young dog of mine, running across the wind, struck the full scent of a nice covey at close range. He made a beautiful and snappy stop; but he was a little too much doubled up for real comfort, and before I got within range he made a slight movement to ease his position, and the birds flew instantly.

Mr. Taylor always seemed to think that Ben loved to hunt, and he was inclined to give Ben the privilege whenever his friends wanted him; in fact, he was almost too generous for the dog's good.

While, as I said at the beginning, I have many precious memories of Ben in the field, it is a matter of deep sorrow to me that I shall never again see that handsome old fellow pull up on a covey, and that in my walks in the woods next summer Ben will not be my companion.

Ben Hur was finely bred, going back on one side to Champion Gladstone and on the other to Champion Druid. His immediate progenitors were Ben Hill and Zoe W. On Ben Hill's side of the house he had Ruby and Champion Druid, and on Zoe W.'s side Champion Gladstone and Fawn.

Ben Hur was winner at the dog show in Cincinnati in 1890; in Denver in 1890; he carried off the red ribbon at Chicago in 1891; Cleveland in 1891; Kingston, 1892; Ottawa in 1892; and Toronto. In 1893 he won first at Philadelphia and at Denver, second at Detroit, Washington and Philadelphia; and in 1894 he again captured the blue ribbon in this city. He has also won various recognitions in the field.

Trying the New Coon Dog.

It was a glorious night for a coon hunt, and the visitors were anxious to try the new dog which Burdette had lately purchased in the South for good money. He was indeed a fine-looking specimen, young, keen and active. His owner had already killed three coons that Tan had treed, and was enthusiastic over his acquisition.

Leaving the team at the old house, we had scarcely entered the orchard in its rear when Tan, who was evidently a "track-barker," opened out, full and clear, his splendid tenor ringing through the valley and having in it a wild note that stirred the blood of every listener. Down through the orchard to the brook, then up the half-dry channel for 60 yds., then off to the right again for 60 more, and—"He's barking up," cried Burdette, in eager tones.

"No," answered a more experienced member of the party, "that's a 'ledge' bark; he has run them in."

"Perhaps you're right," admitted Burdette, "but if that is the case he'll not stay there long." And sure enough, in five minutes Tan stopped barking and came back to us.

By the shift light of the lanterns Edgar and I exchanged glances. We knew more about the ledges over there than we cared to tell just at that time.

At the edge of the woods we left the two "heavy" members of the party to enjoy a rest, while Burdette, Edgar and myself struck out for the meadow at the head of the valley. Half way to the Cascades, Tan opened again, right in the brook this time.

"No guesswork about that trail," said his owner; "nothing but coons paddle around in the water."

How the echoes rolled through the heavy timber and resounded from the hills on either side, as, dashing through the mud and water of the swamp, the eager hound drove straight away for perhaps a hundred yards, and then we heard again his baffled "ledge" bark, and again he came back, as though satisfied with having "run them in."

This time the lantern showed a look of wonder in Edgar's eyes. He didn't happen to know about that particular ledge, but saw that I did, and with a quiet smile led the way up the smoothly worn channel of the brook. We listened to Burdette's explanation of the advantages of a coon dog that wouldn't "hang around an old ledge all night," and plodded on in silence. As we skirted the little pond at the foot of the meadow and were looking at the tracks of some deer which had been down to drink, Tan gave tongue again at the edge of the woods, but seemed to lose the scent on the upland, and so we called him off and swung to the left over "Uncle Sam's" hill to the big orchards on its southern slope. We were about ready to call it a bad job when the hound, who had been threshing the brush on the lower side of a stone wall, broke loose again and went tearing down the steep hillside in a perfect avalanche of roars.

"He's right on his back!" yelled Burdette, as he plunged after the dog, to the imminent danger of his own neck, which, as Edgar remarked, was "too short to tie, if he should happen to break it."

"He's got 'em dead to rights this time!" he howled

back to us through the brush: "that's his tree-bark, sure."

We found the irrepressible Tan "barking up" a big hemlock that stood by itself among a dense undergrowth of briars and swamp maple. He had chewed up all the small bushes around the tree, and commenced on the tree itself when we got there, and was making more noise than a brass band.

We set to work with a hatchet and cleared a spot for Mr. Coon to fall in, and just as the "heavy contingent" came puffing and blowing up the hill Burdette buckled on his revolver and climbers, and went up the tree like a telephone man. After he disappeared among the branches there ensued a seemingly long period of suspense, during which Tan continued to bark (and chew bark) in a manner that was surprising even to old coon hunters.

Suddenly, from somewhere above us, came the sound of an explosion, which, although somewhat sulphurous, could not be ascribed to the burning of gunpowder, and a rustling as if the climber was hastily descending.

"What's the matter up there?" sang out the Fat Man.

The answer came back through Burdette's clenched teeth:

"It's a gol-blasted hedgehog!"

ELKINS, N. H.

POINTS AND FLUSHES.

A few words dropped out of a line in the report of the Manitoba Field Trials Club, published in our last week's issue, made it appear that his Honor Charles Patterson judged the club's trials last fall. Mr. Thos. Johnson was the judge, and the club tendered him a vote of thanks for his services, which he rendered gratuitously.

Mr. George W. Richards, well known as a successful field trial handler, had an operation performed for appendicitis, in St. Paul, Minn., where he went after the trials were concluded at New Albany, Miss. He desires it known that he is engaged to train for the Verona Kennels for one year.

Yachting.

THE report of Mr. Æmilius Jarvis to the Council of the North American Y. R. U., which we publish this week, gives in detail the story of his visit to England, as already recounted in brief. The report shows in the first place that, contrary to the brief accounts first cabled, Mr. Jarvis met with a most cordial reception, and that his mission was accepted in the same spirit in which it was planned on this side—as a means in bringing closer together the yachting organizations of the two great yachting nations. As to immediate results, Mr. Jarvis, unlike most American yachtsmen who visit the other side, knew exactly what he wanted to see and to learn, and apparently made the most of the opportunities so generously afforded to him by the Council and the designers. He has brought back with him much more valuable and reliable information as to the actual working of the present Y. R. A. than has thus far been current in this country.

On this point, of the beneficial results of the rule, the evidence of owners and designers is apparently unanimous, and it is strengthened by the indisputable proof of the sections of successful yachts of last year and of new ones planned under the rule for the coming season. The time intervening between the giving out of the report and our press day was too short to admit of the reproduction of the diagrams, but we shall publish them next week.

The North American Yacht Racing Union.

TORONTO, Feb. 21, 1898.—To the Chairman and Council of the North American Yacht Racing Union.—Gentlemen: At a meeting of your Council, held in the Fifth Avenue Hotel, New York, on Oct. 30, 1897, Mr. J. M. Macdonough and the writer were appointed a committee whose duties may be briefly expressed as follows:

(1) To confer with the Yacht Racing Association of Great Britain upon the best means of bringing about uniformity of measurement rules upon both sides of the Atlantic.

(2) To obtain definite and authentic information as to the working of the present Y. R. A. rule, namely:

$$\frac{\text{Length} + \text{Beam} + .75 \text{ Girth} + .5 \sqrt{\text{Sail Area}}}{2} = \text{Lineal Rating},$$

and (3) To discuss the feasibility of regulating scantling. On behalf of the committee I now submit a report:

We arrived in London on Nov. 10 last, and immediately placed ourselves in communication with the secretary of the Y. R. A., Mr. Dixon Kemp. Owing, however, to his illness, a considerable delay took place, and before any discussion could be had with the representatives of the Y. R. A. respecting the object of our visit Mr. Macdonough was obliged to leave London, and I was left to confer with them alone, and to gather the necessary information. The results of these conferences and inquiries I have now the honor to lay before you.

Owing to the delay above alluded to there was no opportunity afforded me for any preliminary discussion with the officers of the Y. R. A., and consequently when the general meeting of the Association was held (at the Langham Hotel, on Dec. 2) I found that they were quite unprepared to deal with the matters which I had to lay before them, or even to discuss them except in the most general way, and I found it impossible then to bring about an intelligent discussion of the objects of our visit.

I had, however, opportunities subsequently for discussion of these with several members of the Y. R. A., who became warmly interested therein, and a second meeting was called which I was unfortunately unable to attend.

The chairman, Sir George Leach, however, most courteously called a special meeting of the Council, at which I met a few of its most active members.

As the result of this and other conferences I received an official communication from the Y. R. A. (which is appended), firstly, expressing their appreciation of your action in appointing a committee to confer with them on subjects of such importance to yachtsmen on both sides of the Atlantic; secondly, answering certain specific questions put by me; and thirdly, suggesting a plan of co-operation for the future.

From the members of the Council whom I then had the pleasure of meeting I learned that the present rule has checked the tendency to shoal-bodied boats; that it is satisfactory to the majority of yacht owners; and that it would be impracticable, even if desirable, to make any alteration at the present time. These views were confirmed by other yachtsmen whom I met, members of the Y. R. A. and otherwise, including all the naval architects hereafter mentioned. The consensus of opinion is that the rule is producing what was intended, namely, a fuller-bodied boat, also that it does not encourage in too marked a degree any particular form, as every form of racing yacht may win in its particular weather. This is shown by the following notes on the prize records in the most keenly contested classes:

In the larger class Bona was the most successful. She is a vessel with a full under-water body. Aurora is also a vessel of full body. She was late in coming out, but after some alterations had a fair measure of success.

In the 65ft. class there was no racing yacht built last season under the present rule, and Isolde still heads the list of winners. The racing in this class therefore affords insufficient data for comparison.

In the 52ft. class Penitent and Morning Star were the most successful. Both are vessels with full sections.

In the 36ft. class the first prizes were very evenly distributed—Emerald with 16 firsts, Westra 12 firsts, Hermes 11 firsts, Forella 9 firsts, and Heartease 8 firsts. These craft are by different designers, and vary from exceedingly hollow to full sections.

A similar experience is met with in the 30ft. class, where the first prizes were also fairly divided between three or four, viz., Carol, Gwendoline and Lora. They are also craft varying in form of midship sections.

I have now to speak of another most important and most interesting part of my visit.

Through the introduction of individual members of the Y. R. A. I was most courteously received by the various naval architects, who afforded me every opportunity of studying their designs and many of the craft themselves; and as they were in winter quarters it was a most opportune time for the latter.

I first visited Mr. Linton Hope at Greenhithe, where I saw many of the small craft which he has made such a success of, and a design from which he is building for the 52ft. class. He gave me a tracing of the midship section of this craft, together with one of a successful 24-footer.

I next visited Mr. G. L. Watson in Glasgow, who furnished me with a similar tracing of one of his most successful craft of the past season, together with a tracing of a design from which he is building a 65-footer, also section of a fast cruiser.

I next visited Mr. William Fife, Jr., at Fairlie, on the Firth of Clyde. He gave me tracings of his most successful craft in the 52ft. and 36ft. classes, and showed me designs of a 65-footer building.

I next visited Gosport and went over the yards there. Mr. C. E. Nicholson, of Camper & Nicholson, gave a similar tracing of his most successful 30-footer. While in Gosport I was the guest of Mr. R. E. Froude, of the Royal Naval Experimental Works and a prominent member of the Y. R. A.; he took great interest in the matter and gave me much practical and technical information. As he is a man of world-wide reputation, I have no doubt that his suggestions will greatly interest you, and I inclose with the correspondence a copy of a letter received from him, together with one from Mr. G. L. Watson.

From Gosport I went to Southampton, and there went over the yards of Messrs. Fay & Co., Summers & Payne, and White. At these yards many of the famous racing yachts were in winter quarters, and I had an excellent opportunity of comparing side by side the productions under the length and sail area rule with those of the present rule which takes girth as a factor. Mr. Soper, of Fay & Co., gave me a tracing of one of his large craft which has had a fair measure of success. At Summers & Payne's, side by side, are the 52-footers Niagara, Audrey and Penitent. This afforded an excellent opportunity of comparing the three.

Penitent, as you are aware, has been the most successful in the 52ft. class, and is a boat of full section giving excellent living accommodations for a boat of her size. Here also was a craft built some years ago under the length and sail area rule; for a time she was outclassed by the shoaler-bodied boats, but under the new rule has been again raced with success. Mr. Payne furnished me with tracings of the midship sections of four of his most successful craft, and it is to be noted that the cross sections vary very considerably in style.

I cannot express too strongly my appreciation of the kindness and courtesy shown me by these various designers. Their willingness to impart information, and the unselfish way in which they permitted me to examine their drawings and models, indicated their warm interest in the object of my mission.

As to the third section of our instructions, namely, a discussion of the practicability of adopting a limit for scantling, I found that nothing could at present be accomplished in this direction.

As to the third section of our instructions, namely, a discussion of the practicability of adopting a limit for scantling I found that nothing could at present be accomplished in this direction.

I much regret that owing to Mr. Macdonough's unavoidable absence from England I had not the benefit of his co-operation in the discussions that were held and the inquiries that were made, and as he is still absent in Europe I cannot submit this report for his approval. I append, however, a copy of a letter which I have received from him since my return, in which his views are expressed.

I send you herewith, on sheets numbered 1 to 15, cop-

ies of the tracings of midship sections given to me, referred to above. On sheet No. 1 I have indicated the mode of measuring girth. I am, dear sirs, yours faithfully,

(Signed)

ÆMILIUS JARVIS.

(Copy.)

To Sir George A. Leach, K. C. B., South Kensington, Chairman Y. R. A.

London, Jan. 7, 1898.—My dear Sir: In your note of Dec. 2 last you expressed a wish to be advised as to my movements; therefore I write to say that business calls me to Scotland on Monday next, where I shall be for at least a week.

From your note and from a conversation recently had with Mr. Newton-Robinson I gather there has been a misconception of the object of our visit. Mr. Macdonough and myself were appointed a committee by the Council of the North American Yacht Racing Union to confer with your body upon the measurement rule question and other subjects of interest to yachtsmen, and to obtain authentic and practical information as to the working of your rule—if it was satisfactory on the whole to yacht owners—and what type it was producing. I might say we had an impression it was not altogether popular, which impression no doubt arose from the recent proposed change.

Nothing in our instructions gave us power to bind our Union; therefore it was not expected to commit yours, but merely bring about a state of affairs that should in the future prove beneficial to both bodies, it being evident both are striving to bring about the same result.

Trusting to have the pleasure of meeting you again before my return to Canada, believe me to be, yours faithfully,

(Signed)

ÆMILIUS JARVIS.

(Copy.)

6 Wetherby Gardens, South Kensington, Jan. 6, 1898 (crossing my letter of 7th).—Dear Mr. Jarvis: We are rather at sixes and sevens in the Y. R. A. matters in consequence of the resignation of our secretary. I sent your note to Mr. Lake, who is acting pro tem., and he was to call a meeting between the dates you named, Jan. 3 and 8; but as I have no notice from him, it seems probable he has forgotten among other pressing business—for he is a very busy man—to do so.

If you will send me a wire when you receive this I will get a few of the members to meet you on Saturday afternoon or Monday afternoon, if that will be convenient to you. Please give me your address in town, so that I may communicate with you there, instead of through the Montreal Bank, as this will probably save time. Yours faithfully,

(Signed)

G. A. LEACH.

(Copy.)

6 Wetherby Gardens, South Kensington, Jan. 7, 1898.—Dear Mr. Jarvis: I have called a meeting at the Royal London Yacht Club, 2 Saville row, West, at 2:30 tomorrow afternoon, in response to your telegram. I hope this will suit you. I have not yet received your letter. Yours faithfully,

(Signed)

G. A. LEACH.

(Copy.)

Yacht Racing Association, 2 Haarlem Mansions, West Kensington, W., Jan. 22, 1898.—To Æmilius Jarvis, Esq., care of Bank of Montreal, 22 Abchurch lane, London.—Dear Sir: The Council of the Yacht Racing Association desires me to express to you the sincere satisfaction with which it welcomes the action of the North American Yacht Racing Association in deputing yourself and Mr. Macdonough to confer as to the possibility of bringing the British and American rules of yacht measurement in approximation, so that the yachts of either country may compete in the other without serious disadvantage.

The Council is conscious of the very great difficulty which would be experienced in any attempt to agree upon one and the same rule for both countries, and if such agreement were attained it is of opinion that differences of climate would cause the evolution of rather diverging types of yachts on the opposite side of the Atlantic.

At the same time the Council, understanding that the general desire of American yachtsmen, like that of our own, is for a rule which will produce wholesome and roomy sea boats, feels confident that your Association will be able to assimilate British and American racing yachts in type by adopting some formula conceived upon similar lines to our own; yet with such variations as the conditions of the American climate and racing courses may render necessary.

In reply to the particular questions which you have addressed to the Council, I am to say that the measurement rule

$$\frac{L + B + .75 G + .5 \sqrt{S.A.}}{2} = \text{Lineal Rating},$$

which has now been in operation in British waters for two seasons, appears to give general satisfaction at present.

It was adopted in order to correct the tendency of the former rule

$$\frac{L \times S.A.}{6,000}$$

to produce yachts of very small displacement and sail area relatively to their hull dimensions.

The operation of the new formula has been decidedly such as was expected by its framer.

In conclusion, the Council hopes that after your Association has thoroughly tested whatever rule it may finally adopt, another opportunity may be afforded for a conference between the representatives of the two organizations, with a view to harmonizing such changes in the respective formulæ as may ultimately appear to be desirable. I am, dear sir, your obedient servant,

Signed

B. HECKSTALL SMITH, Sec'y.

(Copy.)

London, Jan. 31, 1898.—To B. Heckstall Smith, Esq., Secretary Yacht Racing Association, West Kensington. —Dear Sir: Your letter of 22d inst.: I beg to acknowledge its friendly expression, and the valuable information it contains I feel will be received and appreciated by the North American Yacht Racing Union in the warmest possible manner; and it will give me the greatest pleasure reading its contents and reporting to the Council the results of my observations, and the knowledge obtained through your Association and its individual members on the practical working and type of racing yacht being developed in G. B. under your present formula,

$$L. + B. + .75 G. + .5 \sqrt{S. A.}$$

Your suggestion for us to adopt a rule, if not identical, at least moulded on similar lines to yours, and then, after a few years' experience, both organizations meet in conference to exchange ideas and experiences, appears to me to be a most practical way to bring about uniformity of rule and type of racing yacht on both sides of the Atlantic.

I am returning at an early date, and will at once make my report to the Council, who in due course will, through our honorable secretary, Mr. Jones, address to you our official acknowledgment of the courtesies extended to their committee, Mr. Macdonough and myself. Meanwhile kindly accept our sincere appreciation, and believe me to be, yours very faithfully,

(Signed)

ÆMILIUS JARVIS.

(Copy.)

Yacht Racing Association, 2 Haarlem Mansions, West Kensington, West, Jan. 31, 1898.—Æmilius Jarvis, Esq., 22 Abchurch lane, London, E. C.—Dear Sir: I am in due receipt of your favor of this date, which it will give me much pleasure to read to the Council at their next meeting. I am, dear sir, yours faithfully,

Signed

B. HECKSTALL SMITH, Sec'y.

(Copy.)

108 West Regent street, Glasgow, Jan. 28, 1898.—Æmilius Jarvis, Esq.—Dear Mr. Jarvis: I have been at it night and day since I saw you, and this must be my excuse for neglecting to write you before this. I, however, now inclose midship sections of two racing boats and a fast cruiser, which I trust may be of use and interest to your friends.

With regard to the centerboard question, I think our rule penalizes it out of existence, and that in framing any rule the clause regarding the board would have to be modified. As for American waters, I think it a very necessary adjunct. You have a lot of harbors accessible only for boats drawing under roft., and you cannot get sufficient depth for weatherly purposes in a boat of any size without more draft than this. Were I making any alteration in our rule, I would suggest easing up the penalty on girth. As the rule acts at present, you can put 1½ ft. of beam or 1½ ft. of length for the same penalty as 1 ft. of draft. My feeling is that this encourages too much curtailment of draft—a dimension which gives the best type of stability, and is also necessary of course for weatherly purposes. This I say is my feeling for the rule over here, but with the American yachting ports you want as moderate draft as possible, for there it might do very well as it stands. Yours very truly,

(Signed)

G. L. WATSON.

(Copy.)

North Lodge, Alverstoke, Gosport, Feb. 3, 1898.—Dear Mr. Jarvis: In my previous letter to you of this evening I had not time to say anything about the subject of your mission. As I said in the course of our conversation, it seems very much to be desired that the experts on both sides of the Atlantic should confer and make use of each other's experience when opportunity arrives, and in the meantime it is certainly desirable, in order that our experiences may be mutually profitable, that we should work on somewhat similar lines. If in America you could adopt your present rule, or something similar to it, provisionally, the result would be very interesting and valuable, and not the less so if as you anticipate—and I think you are right—the same rule should lead to a somewhat different boat in the two countries owing to a difference in conditions. If our present rule were not adopted *holus bolus*, it occurs to me to suggest that a very interesting variation would be $L. + B. + .75 G.$ simply, leaving the $.5 \sqrt{S. A.}$ out, and this would tend, I think, to produce more nearly the popular kind of craft in America, viz., a craft of larger cross sections, and more power of cross section relatively to length, than our present rule. For of course the power of taking more sail leads to increase in the hull qualities that make for sail carrying.

Personally I should greatly welcome the adoption of such a rule in America. For I strongly hope myself that if we make any change in our rule we should take the opportunity of abolishing the sail tax, and the experience of the result of its abolition in America would be most valuable to us.

It seems to me that, taking the $L. + B. + .75 + .5 \sqrt{S. A.}$ as a starting point, dropping the $.5 \sqrt{S. A.}$ out, would be very closely equivalent to introducing $K. \sqrt{M. S.}$ with a negative sign in the division, and if so would be an immensely more simple way of producing the same effect. It would be doing away with one complicated measurement, instead of introducing another in addition.

Then again, I think there is a pretty general feeling among those—here—who approve of the present rule and approve of a small sail tax in principle that the present sail tax—i. e., in our present rule—is too light to produce any effect worth having in the way of promoting snug sail plans, and that from that point of view we have all the bother of sail measurement for next to nothing. Yet if you keep the $B. + .75 G.$ and increase the $S. A.$ tax—i. e., put say $\sqrt{S. A.}$ vici $.5 \sqrt{S. A.}$ —you

will almost certainly get a longer and less powerful type of boat than is desired across the water.

For my own part, though I personally prefer a boat that neither requires nor can carry a large press of sail relatively to length—I prefer an easily driven boat—it seems to me absurd for racing purposes that boats should not be allowed to take as much sail as they can utilize to advantage, and therefore I am against all sail tax on principle. Believe me, yours very truly,

R. E. FROUDE.

(Copy.)

Hotel Victoria, Monte Carlo, Feb. 3, 1898.—My dear Jarvis: Allow me to congratulate you heartily on the success of your efforts in England, and to thank you for your kindness in keeping my name forward in the negotiations. If I can be of any use later on, during the month of April, well and good. The final letter from the Council seems in my opinion to leave nothing to be desired. The basis for further negotiations being formed, it now only requires a little tact to keep both sides working in unison. Yours sincerely,

(Signed)

J. M. MACDONOUGH.

We are unable to reproduce in this issue the sections mentioned by Mr. Jarvis, but they will appear next week.

Building on Lake Ontario.

THE order which Crowninshield has from R. H. Fenwick, of Chatham, Ont., is for a boat in the 32 ft. class of the Yacht Racing Union of the Great Lakes, and will be 27 ft. 6 in. l.w.l., 11 ft. 6 in. beam and 5 ft. draft, with a metal centerboard through the keel. The keel will be of iron, and weigh about 6,000 lbs. The boat will have a cabin house 14 ft. long and a roomy cabin, with 6 ft. head room. Under the "waterline and sail area" rule of the Union she will be allowed about 1,300 sq. ft. of sail, which will probably be carried in a jib and mainsail rig.

In noting the order for the boat in these columns the writer said that she would have "quite heavy scantling under the specifications drawn for the Union by W. P. Stephens." "Comparatively heavy scantling" would perhaps have been a better phrase, since the lighter scantling of Boston built boats was in the writer's mind at the time. The Lake boat will by no means be an extra heavy one, and yet she will be heavier in several ways than even a strongly built cruiser here, to say nothing of an out-and-out racer.

Conforming strictly to the specifications of the Union, designer Crowninshield will give the new boat frames which will be 1½ in. square at the heel, 1¼ at the turn of the bilge, and 1¼ at the head. These will be the frames for two-thirds of the length amidships, as required by the rules. At the ends of the boat the frames will be ¾ in. smaller. The frames are spaced 10 in. on centers.

The nearest available comparison for these figures in a Boston boat is the Baker 30-footer of Crowninshield's design, now practically completed at Lawley's. This boat is confessedly a heavily built boat, although she will be raced, for her owner insisted upon a light boat as the first requisite. In the Baker boat the frames are of uniform size of 1½ in. square and are spaced 10 in. on centers.

In the matter of planking the Lake boat is the lighter, since but a thickness of but 1 in. finished is required, while the Baker boat has ¾ in. more thickness in her double planking. In the keel, however, the balance is the other way. The Lake boat has a keel 4½ in. Designer Crowninshield would make it at least a third lighter were he not restricted.

The deck frame of the Lake boat is much the heavier. The deck beams at the partners, the bitts, the traveler, and at each end of the break in the deck for cabin house and cockpit will be 2½ x 2½ in., tapered to 2 x 2½ at the ends. The other beams are allowed to vary from 1½ x 2½ to 1½ x 2. In the Baker boat the big beams are 2½ x 2½, while the others are 1½ x 2½.

The deck planking of the Lake boat will be ¾ in., covered with canvas, while that on the Baker boat will be 1½ in., for the reason that it will be kept holystoned, and must therefore have extra thickness to allow for wear. The deck of a racing "thirty" would be much lighter.

The foregoing figures show that the Lake restrictions compel more than the equivalent of a strongly built boat here, and yet the boats will probably be none too strong to stand the buffeting they are likely to get in the choppy seas of the Lakes.

Although I should build a racing boat for these or any other waters considerably lighter there were no restrictions," said designer Crowninshield, in giving the figures, "I nevertheless think the Lake restrictions an excellent thing, and perfectly fair so long as everyone is compelled to build under them. "The specifications are specially good in their requirements for clamps, bilge strakes and other strengthening parts, but I think the deck frame a little too heavy, even for severe service. "Measurement rule and specifications together provide to give a very good type of the combined cruiser and racer, and I should not be surprised if we found ourselves compelled here in the East to adopt similar construction requirements."

In all of which ideas the writer heartily concurs, except that which commends the "waterline and sail area" rule. That is another question not now under discussion.—W. E. Robinson, Boston Globe.

The Emperor's Cup.

It is announced that the cup given this year by the German Emperor for the race from Dover to Heligoland will be a bowl of egg shape form and stand over 2 ft. above its base. The design was made by His Imperial Majesty, and has been much admired by the connoisseurs of Berlin.

His Imperial Majesty's cup committee met at Grosvenor House, the residence of the Duke of Westminster, the Marquis of Ormonde, president, in the chair. The other members present were Sir Edward Sullivan, Bart.; Admiral Baron von Senden, A.D.C.; Sir Edward Birkbeck, Bart.; Prof. Busley, Lord Colville, of Culross, Lord Inverclyde, Admiral von Eiseindecken, Mr. Dixon Kemp, and Mr. Richard Grant, hon. secretary. At the request of the German Emperor the date for starting the match was fixed for Monday, June 20, at 2 P. M., from Dover, entries to close on June 1, at Cowes, with the hon. secretary, and the handicap to be made on June 3 by a subcommittee consisting of the Marquis of Ormonde, Prof. Busley, the Earl of Lonsdale, Mr. R. G. Allan, Baron von Eiseindecken, Mr. Dixon Kemp, Sir E. Sullivan and Mr. Richard Grant. It was directed that a vote of thanks should be sent to the Emperor for his continued support of yacht racing. The match will be open to cruising yachts of 50 tons Thames measurement and upward, the definition of a cruiser to be left to the subcommittee, with the understanding that a yacht which is capable of making a voyage shall be deemed a cruiser. The handicap is to be framed on the lines of that for the Royal Yacht Squadron's Queen's cup.

As the match for the German Emperor's cup has been fixed to be started on Monday, June 20, instead of Tuesday, it is probable that Mr. Gordon Hodgkinson will have his match for the North Sea Cup started on Saturday, June 18.—The Field.

The Defense of the Seawanhaka Cup.

WORD has just been received from Lord Strathcona that he would like to take a more active part in the defense of the Seawanhaka international cup for small yachts than he has in the past, and through the medium of Mr. A. F. Riddell, vice-commodore of the Royal St. Lawrence Y. C., he has made known his desire to have a fast 20-footer built for the trial races. Mr. Duggan will design her and have full charge of building and the selection of the crew, and it is expected that work on her construction will shortly be commenced at the Royal St. Lawrence Y. C.'s sheds.

Another gentleman, who will in a few days begin the construction of a cup defender is Mr. Huntly Drummond, son of Senator Drummond. His boat is being designed by his brother, but will in all probability be built also in the Royal St. Lawrence Y. C. sheds. This, together with the brokers' boat, which has been started, and the boat for Mr. H. Montagu Allan, which has only been spoken of, makes the nucleus of what promises to be a very fair fleet of cup defenders.—Montreal Gazette.

Atlantic Y. C.

THE Atlantic Y. C. has planned a lively season for its initial year at Sea Gate, and the regatta committee has announced the following events:

Opening race, Decoration Day, May 30, special prize to winning yacht in each class; course 15 miles.

Saturday, June 11, Gould cups, open to yachts of all clubs. These prizes, presented by former Com. George J. Gould, are: First, for schooners in racing trim, value \$500; second, for cutters and sloops in racing trim, value \$300; third for the special 30 ft. class, first prize a cup valued at \$150, and the second prize \$25; fourth, mainsail yachts; first prize a cup valued at \$100, and the second prize \$20.

Schooners and cutters will sail the outside course—around the Scotland and Sandy Hook lightships and return—distance 33 miles.

The special 30 ft. class and mainsail yachts will sail the course from Gravesend Bay, off the club house, to the Bell Buoy, off Sandy Hook, thence to Orchard Shoal Light and back, 20 miles.

Annual regatta, Tuesday, June 14, open to yachts of all clubs. prizes to winning yacht in each class.

Saturday, June 18, Adams cups races, open to yachts of all clubs. Prizes presented by Com. Frederick T. Adams: First, a cup for the special 30-footers, valued at \$150; second prize \$25. Second, a cup for cutters and sloops of classes J to N, of the value of \$150; second prize \$25. Third a cup for mainsail yachts, of the value of \$100; second prize \$15. Fourth, a cup for the dory class, of the value of \$50; second prize \$10.

Entries for races may be made to Col. David E. Austen, chairman of the regatta committee, A. V. C., No. 67 Chambers street, New York.

The Chicago Y. C.

AFTER some years of inaction, the old Chicago Y. C., organized in 1876, has been revived, with the following officers for 1898: Com., W. F. Morgan; Vice-Com., George R. Peare; Rear-Com., George Warrington; Sec'y and Treas., Charles H. Thorne; Board of Trustees: C. E. Kremer, James H. Channon, Louis Wachsmuth, William Herrick and the commodore, ex-officio.

The fleet includes the following yachts: Schooner Idler, 107 ft.; schooner Hawthorne, 65 ft. class, 90 ft. over all; schooner Mistral, 65 ft. class, 90 ft. over all; sloop Siren, 44 ft. class, 65 ft. over all; sloop Vanenna, 44 ft. class, 65 ft. over all; steamers Pathfinder, Sentinel, Thistle, Catherine C. and Wilber.

One match has already been arranged within the club, the following agreement having been signed:

"We, the undersigned, of the sloop yachts Vanenna and Siren, do hereby agree to sail a series of best two in three races, under the auspices of the Chicago Y. C., the said races to be sailed on or about July 9, 11, and 18, 1898, for Chicago Y. C. trophy and the championship of the club. This being a special regatta, we will each select a friend, the two to select a third. The three will form a committee to arrange all details of the race.

GEORGE R. PEARE, owner of Siren.
W. R. CRAWFORD, owner of Vanenna.
Mr. Crawford has chosen Mr. Benjamin Carpenter, Mr. Peare has chosen Mr. E. C. Berriman.

Y. R. A. of Long Island Sound.

THE annual meeting of the Yacht Racing Association of Long Island Sound will be held on Monday evening, March 21, at the Fifth Avenue Hotel, New York.

North American Yacht Racing Union.

A MEETING of the Council of the North American Y. R. U. will be held on Saturday, April 23, in the afternoon, at some place in New York, which will be announced later.

YACHTING NEWS NOTES.

The Columbia Y. C., of New York, held its annual meeting on March 1, the following officers being elected: Com., Walther Luttgen, steam yacht Linta; Vice-Com., W. Dixon Ellis, naphtha Rambler; Rear-Com., W. C. Trageser; Sec'y, George Parkhill; Treas., Joseph A. Weaver; Fleet Surgeon, Dr. Henry Griswold; Meas., W. E. Quackenbush; Members of the Board of Trustees, to serve for two years: J. F. Hitchcock, W. H. Carpenter and G. W. Taylor. The date of the opening of the club house was fixed for May 7 and the annual regatta for June 9. The club passed a resolution favoring the bill now before Congress prohibiting the defacement of the American flag by printing or painting pictures, advertisements, etc., on it.

On March 1 a special meeting of the Riverside Y. C. was held at the Arena, New York, with Com. Tyson in the chair. The date of July 9 was named for the annual regatta, and a fall race, in September, was decided on. A proposal to reduce the annual dues from \$25 to \$20 was rejected. The shape of the officers' flags was changed from the swallowtail to the broad pennant.

On March 1 the Greenville, N. J., Y. C. held its annual meeting, the following officers being elected, all for second terms: Com., Alfred Renshaw; Vice-Com., Alex. Reid; Recording Sec'y, William Everett Hicks; Financial Sec'y, C. R. Sampson; Treas., Alfred Renshaw; Delegates to the New York Y. R. A.: Com. Renshaw, W. E. Hicks and C. J. Leach.

A meeting of the regatta committee of the Indian Harbor Y. C. was held on March 2, the following programme being arranged for the summer: First regatta, Decoration Day, for the open class of knockabouts and one-design dory class. Second regatta, circuit race, date to be arranged by the Y. R. A. of Long Island Sound. Third regatta, annual regatta, all classes, Saturday, July 30. Fourth regatta, fall regatta, Saturday, Sept. 3 (probably). The committee has arranged for an open knockabout class, to include the Seawanhaka boats and all other knockabouts, centerboard or keel, carrying not over 600 sq. ft. of sail. Weekly races will be held for the one-design dory class, with a prize for each race, and also helmsman and record prizes for the season.

Vigilant, cutter, Percy Chubb, now hauled up at Hawkins' yard, City Island, is having about eight tons of lead removed from the keel; the change being made under the direction of H. C. Winttingham. This lead is a part of that shifted from inside to outside in 1895, under Com. Gould's ownership. Since then the yacht has been fitted with full interior joiner work and furnishings for cruising, so that her immersion has been increased. The change will put her nearly at her old load waterline.

The Musquito Fleet Y. C., of South Boston, has elected the following officers: Com., C. P. Mooney; Vice-Com., W. H. Ransom; Meas., A. H. Borden; Sec'y, J. M. Sullivan; Treas., C. J. Driscoll; Directors: Com. C. P. Mooney, Sec'y J. M. Sullivan, James Bertram, Thomas W. Flood and John A. De Lier.

Narada, steam yacht, Henry Walters, arrived at St. Michael, Azores, from New York, on Feb. 17.

Canoeing.

American Canoe Association, 1897-98.

Commodore, F. L. Dunnell, Brooklyn, N. Y.
Sec'y-Treas., C. V. Schuyler, 309 Sixth avenue, Brooklyn, N. Y.
Librarian, W. P. Stephens, Bayonne, N. J.

PURSUERS.

Atlantic Division, Wm. M. Carpenter, Main street, Sing Sing, N. Y.
Central Division, Laurence C. Woodworth, Gouverneur, N. Y.
Eastern Division, F. J. Burrage, West Newton, Mass.
Northern Division, Edgar C. Woolsey, 37 Charles street, Ottawa, Can.

Annual dues, \$1; initiation fee, \$1.

Western Canoe Association, 1895-96.

Commodore, C. F. Pennewell, Detroit, Mich.
Vice-Commodore, Nat. H. Cook, Chicago, Ill.
Rear-Commodore, E. H. Holmes, Milwaukee, Wis.
Sec'y-Treas., W. D. Stearns, Detroit, Mich.
Executive Committee: R. M. Lamp, Madison, Wis.; C. J. Steadman, Cincinnati, O.; F. W. Dickens, Milwaukee, Wis.

Red Dragon C. C.

REALIZING the value of a thorough training in the A B C of seamanship, Com. H. W. Fleischmann and Quartermaster Murray have inaugurated a series of ten evening classes in "Ropes, Rigging and Marlinspike Seamanship" in the club, under the experienced and enthusiastic leadership of Mr. A. C. Paynter, of Palmyra, N. J., who has been long and helpfully known to the club members as "Capt. Paynter." During the general fitting up in the spring it is always the Captain's advice which is sought in rearranging and making up rigging, and the boys have learned to rely implicitly upon his judgment and ripe experience in such affairs. The meetings are held weekly in an out-of-the-way corner of old Willing's alley, down town, where after nightfall there are no neighbors in the adjoining office buildings to be disturbed by the applause with which the class is apt to greet the success of a five-thumbed novice who has just mastered a new knot. The course will thoroughly cover the field of rope working and use and general rigging. A log is kept, and at the end of the term a prize will be given the man who has the best record for attendance and work done during the term, and who at the end thereof can make the best exhibition of worked ropes, knots and splices. The class, in addition to affording a convenient opportunity for acquiring useful and necessary information, gives the Red Dragons a chance to meet together in town in a social way once a week during the winter months, when the river club house is snowed in, and the members have shown their appreciation of the opportunity so afforded by attending the meetings in large numbers. J. D. M.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Eastern Division.

George E. Hutchins, Chelsea, Mass.

Rifle Range and Gallery.

New England Sportsmen's Association.

RIFLEMEN should keep in mind the series of rifle and revolver competitions which will be given at the New England Sportsmen's Association's show, March 14-26. There are three championship events, namely, any revolver, military revolver, and pistol championships. In each of these competitions there will be three prizes, silver cups of the actual value of \$50, \$25 and \$10. For rifles (any .22cal. rifles) there is a 50-shot championship competition, 100 measured feet, 25-ring target; any sights except telescopes; off-hand; any .22cal. rim-fire ammunition allowed. Prizes, three silver cups of the actual value of \$50, \$25 and \$10.

There are re-entry matches for the any revolver, military revolver, pistol, and German ring re-entry for rifles; there will also be a Standard American re-entry for rifles, with a Standard American target, reduced to 100ft., 7-ring black.

The prizes in each of the re-entry matches, with the exception of the Standard American, consist of twelve cash prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4 \$3; twelve prizes, dividing 100, as follows: \$20, \$15, \$11, \$10, \$9, \$8; twelve prizes, dividing \$100 as follows: \$20, \$15, \$11, \$10, \$9, \$8, \$7, \$6, \$5, \$4, \$3 and \$2. A total of \$600 in cash and twelve cups, of the aggregate actual value of \$340 will thus be distributed in prizes at this tournament.

Cincinnati Rifle Association.

CINCINNATI, O., Feb. 20.—At the regular practice and medal shoot of the Cincinnati Rifle Association, the subjoined scores were made, off-hand, 200yds., German ring target. Mr. Wellington won the Uckotter trophy:

King target:		Union target:		Special scores:

Cincinnati Defeats St. Louis.

Feb. 20.—The Cincinnati Rifle Association is rejoicing over a victory in a telegraph match, shot on Feb. 20, between ten men of the St. Louis Sharpshooters' Association and ten men of the Cincinnati Rifle Association. The conditions were 200yds., off-hand, at the German ring target. The match resulted in favor of the home team by a small margin of 43 points. The St. Louis team had to contend with very bad weather, they having shot during a snowstorm. A return match has been accepted and the date set for April 3. The matches will tend to awaken a great interest in rifle shooting, as it is the correct way to become expert marksmen.

Following are the scores:

St. Louis.		Cincinnati.	
E W Hawkins	21 18 24 23 15 18 21 22 17 18—197	M Gindele	20 22 23 22 23 23 20 20 20—216

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 15-18.—Utica, N. Y.—Tournament of the Oneida County Sportsmen's Association. Live birds and targets. Open to all. Henry L. Gates, Pres.

March 17.—Wellington, Mass.—Tournament of the Boston Shooting Association. Sweepstakes optional. Targets, 15 events. O. R. Dickey, Manager.

March 22-23.—Stanhope, Ia.—Central Iowa shooting tournament, for amateurs only. Gold medal representing Iowa championship. Manufacturers' agents allowed to shoot for price of targets and birds.

March 22-24.—Elkwood Park, Long Branch, N. J.—Interstate Association's sixth annual Grand American Handicap. 25 birds, \$25, birds extra; \$1,500 guaranteed to the three high guns; \$600, \$500 and \$400; all surplus added.

March 28-30.—Galena, Kans.—Interstate shoot. Two days targets; one day live birds; \$50 a day added. W. W. McIlhany, Sec'y.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Sec'y.

April 5-8.—Baltimore, Md.—Annual spring tournament of the Baltimore Shooting Association. Geo. L. Harrison, Sec'y-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 7-9.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting park, under the management of J. A. Corry.

April 8.—Bridgeport, Conn.—Target tournament of the Bridgeport Gun Club. J. G. Kingsbury, Sec'y.

April 13-15.—Atchison, Kan.—Manufacturers' fourth annual tournament; \$500 added; \$50 high average. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 13-15.—Lincoln, Neb.—First annual amateur tournament of the Lincoln Gun Club. Each day \$50 added to the purses. Geo. L. Carter, Sec'y.

April 13-15.—Macon, Ga.—Tournament of the Interstate Association, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, manager. Address all communications to J. L. Head, Peru, Ind.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17-20.—Newark, N. J.—Tournament of the New Jersey State Sportsmen's Association, on the grounds of the East Side Gun Club. T. H. Keller, Sec'y.

May 17-20.—Tournament of the New Jersey State Sportsmen's Association. T. H. Keller, Sec'y.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-26.—Wilmington, N. C.—Tournament of the Interstate Association, under the auspices of the Eastern Dog and Game Protective Association, H. McL. Green, President.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 8-9.—Findlay, O.—Annual tournament of the Magastrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 14-15.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League of Indiana, on the grounds of the Limited Gun Club.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-16.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Bluebirds thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the 300 Gun Club. Three sets of traps. W. F. Duncan, Treas.

July 1.—Sherbrooke, Canada.—Grand annual tournament. Targets. Regular sweeps, variety and merchandise. C. H. Foss, Sec'y.

July 6-7.—Meadville, Pa.—Tournament of the Interstate Association, under the auspices of the Meadville Gun Club. Chas. Stein, Sec'y.

July 19-21.—Palmyra, Mo.—Eighth annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Sec'y.

July 27-28.—Meriden, Conn.—Tournament of the Interstate Association, under the auspices of the Parker Gun Club. C. S. Howard, Sec'y.

Aug. 17-18.—Waterville, Me.—Tournament of the Interstate Association, under the auspices of the Waterville Gun Club. E. T. Wyman, Sec'y.

Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Mr. Everett Smith, Schenectady, N. Y., writes us that "The Schenectady Gun Club has been presented with an exceedingly rich gold trophy by Mr. John Kilgour, president of the Cincinnati Electric Railway System. Mr. Kilgour has since his youth been interested in wholesome outdoor sports, especially that of trap-shooting, and has a son who is one of the leading shots in the above-named club. The trophy is to remain the property of the club and be shot for by the members at handicap distances each month."

The Independent Gun Club, of Reading, Pa., has issued an interesting programme for the Pennsylvania State shoot. The open events are bound to draw well, as the club has been decidedly liberal in the amount of added money offered for the shooters from outside the State. Many thousands of targets will be smashed at Shillington, Pa., during the first three days of the tournament—March 29-31. Friday, April 1, the fourth day, is devoted to live-bird shooting exclusively.

A short time ago a series of three matches was arranged between T. W. Morley, of Lyndhurst, N. J., and T. Chris. Wright, of Paterson, N. J., each match being at 100 targets, unknown angles, Sergeant system. The first match was shot on Monday, Feb. 28, at Bunn's grounds, Singac, N. J., Morley winning by the score of 78 to 73. The second match was shot one week later, Monday, March 7, at the grounds of the Lyndhurst Shooting Association. Wright started off with 22 to Morley's 17; following it up with 18 to his 16, the scores showing at the end of the 50th round 40 to 33 in favor of Wright. The third 25 resulted in 19 to 17 in favor of Morley, the total scores thus standing 57 to 52 in favor of Chris Wright, with only 25 more targets to shoot at. Bets of 5 to 2 on Wright were offered without takers, and the layer of odds may feel glad that he was not taken up, for before 15 targets of the last 25 were shot at, the men were tied, Morley finally winning out with 74 to 73. The scores were low, but the background is a very hard one. The third and last match will be shot on the Lyndhurst grounds, on Monday next, March 14, at 2 P. M.

The eleventh and last shoot of the Philadelphia Trap-Shooters' League for the season of 1897-98 was held on Saturday last, March 5, on the grounds of the Southwark Gun Club. Each of the eleven clubs composing the League was represented by a team, interest in the series being kept up to the very last of these monthly shoots. The first Saturday in April will see the beginning of a new series, with probably a new system of handicapping in force. The team race, which is the main feature of these monthly gatherings, is a handicap affair, the weaker clubs being allowed a proportionate number of extra targets to shoot at. First place on Saturday last was won by the Wayne Gun Club, which broke 162 out of 214 shot at. Two sets of traps were kept busy all day, there being a regular programme of events at nominal entrance fees issued for the occasion. In these open events Edward Banks, of the American E. C. & Schultze Powder Company, won first average for the day. Charles Mink, of J. B. Shannon & Co., was second; C. C. Beveridge also being well up to the front.

The following request of the managers of the Grand American Handicap should be heeded by all contestants: "It is requested that entries for the Grand American Handicap be made in ample time to permit the sending of a receipt and admission badge, and for same to reach the maker of the entry prior to his departure for Elkwood Park. Should entries be received so late that it will be impossible to reach the maker of the entry by mail until after Saturday, March 19, receipt and admission badge will not be sent. Therefore shooters who make late entry and do not receive receipt and admission badge will be required to pay 50 cents admission to Elkwood Park, which will be refunded on calling at the cashier's office and applying for receipt, admission badge and rebate ticket covering the amount paid at the gate. All entries made must be accompanied by the maker's full name and address, which will be withheld from publication if desired, and 'shooting name' only used."

The Auburn Gun Club, of Auburn, Me., has energetically prepared for an active season. Mr. L. A. Barker, secretary, under recent date, writes us as follows: "At the annual meeting of the Auburn Gun Club a list of officers was elected as follows: President, O. L. Barker; Vice-President, H. A. Fletcher; Secretary, L. A. Barker; Assistant Secretary, B. Dame; Treasurer, C. E. Conners; Auditing Committee: A. Cushman, Jr., L. G. White and F. E. Francis. It was voted to put in a new set of traps, blind and shooting stand, also to make other improvements on the grounds. A shoot will be held every Saturday afternoon, beginning on April 30 and ending the last Saturday in October, for a gold badge, the badge to become the property of the member winning it the most times during the season. The shoots will be at 25 birds, regular angles. The club has applications from a large number desirous of joining, and feel confident of a successful season at the traps."

Under date of March 2 Mr. E. D. Hicks, Rochester, N. Y., writes us as follows: "Messrs. W. C. Hadley, E. C. Meyer and M. F. Brinsmaid were appointed as a committee last fall by the Rochester Rod and Gun Club to make all arrangements for the N. Y. State Association tournament. The committee are doing all they can to put up one of the best shoots in the history of the Association. The tournament will be held on the Rochester Driving Park grounds. At our last State shoot one of the events had 177 entries, which we think is the world's record. There are many new clubs in this State, and we hope to see them all represented at Rochester next June and swell the entries, and make a new record. The committee is well pleased with its success."

Regular entries for the Grand American Handicap close on Thursday of next week, March 17. Post entries will be received after that date on payment of an extra \$10. Entries have closed heretofore on the Saturday prior to the tournament, but this late date has often caused trouble and delay in publishing the handicaps, particularly during the past two years when the extremely large entry list has given the handicap committee a hard task to wrestle with. This year the handicap committee, consisting of Messrs. Jacob Pentz, Will K. Park and Elmer E. Shaner, will sit on Saturday, March 19, to apportion the handicaps. All those who propose attending the great event of the year should not forget the fact that it will cost them \$10 extra if they don't enter on or before March 17.

R. A. Welch shot well at the Riverton Gun Club's annual shoot on Friday and Saturday last, March 4-5. The New York shooters were conspicuous by their absence, C. M. Chapin, an excellent young shot, being the solitary representative. He upheld the honor of his city by tying Welch for first place in the 100-bird race, the two dividing first and second moneys; on the shoot-off for the cup Welch won the trophy. T. S. Dando shot a great gait the first day, and won third money on Saturday in the big event with 87, Welch and Chapin scoring 89 apiece.

John J. U. M. C. Hollowell has started on a missionary trip for his company that will keep him away from this part of the country, except for the Grand American Handicap, until somewhere about the middle of June. On this trip Hollowell will meet the boys and will tell them all that they may want to know regarding the goods of his company. He was present last Saturday at the monthly shoot of the Philadelphia Trap-Shooters' League, as he is still a member of the Florists' Gun Club, of Philadelphia. His scores were away below his average, his own gun being under the doctor's care, and a strange gun causing all the trouble.

Those who have a desire to see the beautiful and valuable trophy, which will be presented to the winner of the Grand American Handicap, will find it on exhibition in the window at 313 Broadway. It is most artistically designed, the emblematic features being worked into a most harmonious and graceful whole, while the intrinsic value of the trophy is not a matter to pass by unheeded. The whole window is devoted to this grand work of art, save that the floor of the window is profusely covered with U. M. C. Shells, thus making the exhibit suggestive as well as pleasing to gaze upon.

Harold Money, Noel E. Money's younger brother, who is connected with the chemical department at the American E. C. & Schultze Powder Company's works at Oakland, N. J., is fast developing into a first-rate target shot. His work recently on the traps of the Bergen County Gun Club at Hackensack, N. J., and at the Boiling Springs Club's grounds at Rutherford, N. J., shows what practice can do for any one who is a natural born shooter.

There are one or two good shots at Pompton, N. J., the best of the bunch being E. Everett, who is connected with the manufacture of Lafin & Rand's W-A Smokeless. Mr. Everett is only a beginner, but he promises to have a good look in for some of the prizes at the Jersey State shoot, May 17-20. He is a member of the Bergen County Gun Club, of Hackensack, and figures prominently in the scores made over that club's traps.

Mr. Geo. L. Carter secretary, writes us that "the Lincoln Gun Club, of Lincoln, Neb., will hold its first annual amateur tournament on their grounds at Lincoln, Neb., April 13-15; \$50 per day will be added to the purses. A cordial invitation is extended to manufacturers' agents who wish to display their respective lines. They can also participate in the different events for price of targets only."

Within the past thirty days the Chesapeake Gun Club, of Newport News, Va., was organized with a membership of about forty, nearly all of whom are active members. The secretary is Mr. R. B. James. It is gratifying to note the steady and healthy growth of trap interests in the South as well as in the North.

On the second and fourth Wednesdays of each month, commencing on Wednesday of this week, the Boiling Springs Gun Club will hold the E. C. cup handicap, at 15 singles and 3 pairs. Entrance price of targets.

The programme of the fourth annual amateur tournament, to be held at Atchison, Kans., April 13-15, will be ready for distribution March 15. There will be \$500 in cash added, and \$50 for highest average.

The Western delegation to the Grand American Handicap will be housed at the Hotel Norwood, Branchport, N. J., about one mile from the grounds. The Norwood has always been a popular resort for shooters during this week, so that it is scarcely to be wondered at that it has been chosen as Western headquarters, the Elkwood Inn being unable to accommodate the Western shooters.

Secretary John L. Lequin, of the Hazard Powder Company, is a member of the new gun club organized at Orange, N. J. Mr. Lequin has not yet reached the crackjack or dangerous stage of a trap-shooter's career; but if interest in the sport and an earnest desire to improve can accomplish anything, he'll be among the top-notchers before long.

In our issue of March 5 the heading "Three Bridges Gun Club" was erroneously used instead of "Bound Brook Gun Club." The scores were good enough to warrant an objection against any high-handed and wholesale appropriation of them in the manner mentioned.

All shooters who want to get in some preliminary practice for the Grand American Handicap can do so by attending the live-bird tournament at Utica, N. Y., to be held March 15-18, under the auspices of the Oneida County Sportsmen's Association, one of the leading trap-shooting organizations in the State of New York. Capt. A. W. du Bray arrived in New York this week, taking a long flight from the far Southwest to be present at the Boston Exposition in the interest of his house, Parker Bros., and afterward he will be in attendance at the Grand American Handicap. He reports excellent upland shooting in Texas and Louisiana.

Under date of March 5, Mr. W. L. Beardsley, secretary-treasurer, writes us that "At a meeting of the officers of the Kansas State Sportsmen's Association, held March 4, it was decided to hold the next annual tournament of the Association at Ottawa, Kansas, on June 14, 15 and 16 next."

At a meeting of the Altoona Rod and Gun Club officers were elected as follows: President, G. T. Bell; Vice-President, J. H. Davison; Secretary, W. S. Bookwalter; Treasurer, R. H. Fay; Board of Control: G. T. Bell, W. S. Bookwalter, R. H. Fay, W. E. Bell and T. J. House.

The Limited Gun Club, of Indianapolis, Ind., gives notice that the Trap-Shooters' League will hold its annual tournament June 7-8, on the grounds of the Limited Gun Club.

Arizona's Annual Tournament.

Tucson, Ariz., Feb. 23.—The annual meeting of the Territorial Gun Club came to a close yesterday, after a three days' shoot held in this city under the auspices of the Blue Rock Gun Club.

Among the main events on the programme were the following: Individual championship of the Territory at live birds, won by P. Chubb, of Phoenix; individual championship of the Territory at targets, won by Chas. R. Meyers, of Tucson, with 23 out of 25. The team championship of the Territory at targets; this was won by the Blue Rock Gun Club, of Tucson, Chas. Meyers making highest score in this event, and thus winning the trophy and title referred to above. The Hallowell trophy, a handicap, particulars of which are given below.

At the close of the tournament yesterday the annual banquet and meeting of the Association was held at the French restaurant, covers being laid for thirty guests. The following list of officers for the ensuing twelve months was elected: President, Hon. James Finley, of Tucson; Vice-Presidents, M. P. Chubb, of Phoenix; Walter Miller, of Jerome; C. W. Mandesfeldt, of Prescott; K. L. Hart, of Tucson; Treasurer, J. H. Holmes, of Phoenix; Recording and Corresponding Secretary, Chas. R. Meyer, of Tucson.

The by-laws of the Association were after considerable discussion amended to make the individual badges subject to challenge by any member of the Association upon the payment of \$25 and the giving of thirty days' notice to the holders of said badges.

TARGET PROGRAMME.

In the table given below Nos. 1-5 were shot on Feb. 20; Nos. 6-10 on Feb. 21, and the balance on Feb. 22. No. 4 was at 30 singles and 10 pairs; No. 13 was the team race for the championship of the Territory.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14

The Hallowell trophy, a silver two-quart, three-handled cup, was won by Hon. Jas. Finley with a score of 45 out of 54 targets shot at. The winner had a handicap allowance of 13 extra targets to shoot at, but as no other shooter could reach 45, even if he broke all his allowance, Mr. Finley only needed four of his allowance to reach the desired mark. This trophy is the property of the winner, having been put up for competition by Jack Hallowell, now of the U. M. C. Company, who won the diamond badge at the last Territorial tournament one year ago. The detailed scores were:

J Finley, 63	111101111111011111110111111111111101110111	42
Meyers, 50	1111110010111111011111111111111111011101111	43

LIVE-BIRD EVENTS.

On Feb. 20, the first day of the tournament, there was a 15-bird event at pigeons for the individual championship of the Territory. This title was won by Mr. P. Chubb, of Phoenix, who was the only one to score 14 out of the 15. Mr. Aitken had a chance to tie him, but lost his last bird. Fourteen men in all entered for this event, merchandise prizes being distributed in addition to the championship medal. Mr. Aitken won some ducks, Holmes taking a gun case; Wilding won 200 shells and Meyers a shooting blouse. Below is the score in detail:

Nos. 1 and 2 were shot on Feb. 21; Nos. 3 and 4 on Feb. 22. Nos. 1 and 3 were 7 birds, \$4, four moneys; No. 2 was 5 birds, \$3, three moneys; No. 4 was 5 birds, \$2.50, two moneys. All class shooting, ties being divided.

Cleveland Target Co.'s Tournament.

CLEVELAND, O., March 4.—*Editor Forest and Stream:* The writer happened to meet a short time ago one of the class of shooters known as "manufacturers' experts," who had just returned from the Hot Springs tournament. In talking over the Chamberlin tournament for next June I was surprised to hear that he did not intend to attend our tournament, and that the majority of the manufacturers' experts at Hot Springs had also expressed their determination to remain away. Thinking that he did not understand the proposed plan of running the Chamberlin tournament, the writer explained to him how we proposed to run this tournament, and his ideas in regard to coming were immediately changed.

Thinking that it perhaps might be of interest to other shooters of the same class, as well as to the large number of amateurs who are going to attend our tournament, we send you the plan upon which the shoot will be conducted:

As announced in our catalogue, professionals and manufacturers' experts will be barred from participating in the regular programme events, but we will throw for them an equal number of targets free of charge that we throw for any of the other shooters present.

GRAND AMERICAN HANDICAP TROPHY.

Our idea is to so conduct the tournament that the amateurs attending same will not be compelled to contest in the same events against the professional or paid shot unless he so desires. To accomplish this result we will have eight events each day, entrance for which will be \$2.50. All shooters, both amateurs and paid experts, will shoot from the same traps and just the same as though they were contesting against each other, in the same event. We, however, will have two entry books; one for the amateurs only, at which they will pay \$2.50 entrance, and one for the paid experts with the same entrance fee exactly. The experts will not be allowed to enter with the amateurs, but those of the amateurs who desire to "mix it up" with the professional shot will be allowed to enter with the professional shot by paying an extra \$2.50 entrance on their entry book. Amateurs who enter on both entry books will pay \$5 entrance fee in each event, and the one score they make in each event will count on both books.

Conducting the shoot in this way, we feel that at least thirty out of over 100 amateur shooters we expect at our tournament will make the double entry in every event, and that the experts can count upon from fifty to sixty entries in every event in which they contest, and which will give them we think as large a tournament as they generally meet, but a trifle hotter company than they are accustomed to, as only the best of the amateurs of course will enter on their book.

The paid shot will be barred from the average prizes, with the exception perhaps that we will have one good prize for the best average in their class.

We hope we have made the matter plain to both the experts and the amateurs, as to the plan we will adopt, which we think is novel and will be very feasible. We have given a great many tournaments in years past, and at all of these tournaments the paid shot has had the best of it; and while we draw the lines a little closer at this tournament than at any of the previous ones, still we do not think they have any cause for complaint, or any reason for staying away. Of course if they so elect we cannot compel them to come to our shoot, but would regret their absence, as we wish to have as large an attendance as possible, and to surpass our other tournaments in that respect.

PAUL NORTH.

Centerdale Gun Club.

CENTERDALE, R. I., Feb. 25.—*Editor Forest and Stream:* I am pleased to inform you that the Centerdale Gun Club organized here the 22d inst. with an active membership of thirty-two members and an honorary membership of twenty-eight, including His Excellency Elisha Dyer, Governor of Rhode Island. The officers are: President, Hon. A. J. Wilcox; Vice-President, Hon. H. C. Tuthcr; Secretary, N. F. Reimer; Treasurer, George Norton; Captain, W. E. Evans. Board of managers appointed by the president are: N. F. Reimer, J. A. McCormick, W. N. Sweet, J. B. Collins, and the president is ex-officio a member.

I think this is the largest gun club ever organized in this State, and one of which a great deal will probably be heard at the traps, as we have a number of good shots enrolled on our list.

The club will open either the first or second week in April and will use the magautrap.

Clay pigeon shooting is booming in this State, and all the clubs are looking ahead for a very successful season.

Active members—A. J. Wilcox, N. F. Reimer, J. A. McCormick, W. N. Sweet, J. B. Collins, H. L. Swendells, W. E. Evans, C. M. Adams, Firth Broadhead, Byron Cooke, A. C. Potter, S. A. Irons, Jr., C. M. C. Freeborn, Edmund Abbott, M.D., C. H. Mathewson, H. C. Luther, Wm. Sherman, W. E. Cotes, W. W. Mosher, Wm. Jackson, R. Tate, D. Webster, C. H. Cozzens, C. S. Mathewson, C. Cameron, M.D., G. T. Naylor, W. L. Naylor, D. McIver, F. Mackie, Geo. Norton, G. E. Searle.

Honorary Members—His Excellency Gov. Dyer, Wm. Evans, G. E. Sweet, G. E. Joslin, Chas. Seamans, G. Cole, Z. A. Wilson, C. Combs, W. Whipple, F. A. Jenks, H. Walling, A. Shaw, J. Kean, C. Quigley, C. McCormick, A. D. Rose, M.D., S. E. Kinnecom, G. E. Rogers, C. A. Murgatroyd, E. Thurber, J. Tonge, F. Rogers, G. M. Hall, T. Emhoff, M. Sweet, H. P. Wood, Wm. Gorton, E. Ellis, P. Murphy.

I will state that honorary members have no voice in the club's affairs, but simply pay a certain sum to become a member.

N. F. REIMER, Sec'y.

Riverton Gun Club.

THE fifth annual spring handicap of the Riverton Gun Club, Riverton, N. J., began under very unfavorable auspices in respect to weather conditions, a stiff northeast wind prevailing, and with it was a drizzling rain, which in the afternoon changed into hail, and later into snow, conditions far from comfortable to the shooters, and adding much to the difficulties of the shooting. The birds were rendered harder and faster by the storm.

Three events were shot on the first day, March 4. Event No. 1 was a 10-bird handicap, entrance \$10. Davis, Hunter and Kuser tied on 10, Davis winning in the shoot-off; Hunter second, Kuser third.

No. 2 was a 30-bird handicap, \$25. In this event Stokes and Elliott tied on 29; Stokes missed his first bird in the shoot-off and Elliott won.

No. 3 was at 15 birds, three misses out, unlimited sweep, \$10 entrance, handicapped as follows: 30yds., one miss; 29yds., two misses; 27yds., three misses. Welsh, Stokes, Elliott and Hunter tied on 14; Welsh killed 20 straight in the shoot-off, and second, third and fourth were divided between Stokes, Hunter and Elliott.

Events:	1	2	3	Events:	1	2	3
Davis, 27	10	25	11	Elliott, 30	29	14	
Hunter, 25	10	23	14	Barker, 28	28		
Kuser, 28	10	23		Chapin, 27	26	12	
Stokes, 29	8	23	14	Taylor, 26	26		
Welsh, 30	8	27	14	Price, 27	24	13	
Smith, 27	6	26	13	Hector, 27	26		

In No. 3 Hunter and Price were set back to 30yds.

A miss-and-out event, \$5 entrance, resulted as follows: Denny 6, Hector 5, Kuser 5, Davis 4, Welsh 2, Stokes 2, Cropp 1, Denny 1.

The weather on Saturday, the second day, was in sharp contrast to that of the day before. The sun shone clear and pleasant, a gentle breeze from the northeast, shifting later to the west, made the weather conditions agreeable to the shooters and contributed to assist the birds. The birds were a fast lot, getting away promptly from the traps when the latter were sprung.

The event of the day was the 100-bird distance handicap, \$100 entrance. A valuable silver service went to the winner, the money being divided into five parts, namely, 40 per cent. to first, 25 per cent. to second, 15 per cent. to third, 10 per cent. to fourth, and 10 per cent. for the club. Of the fifteen entries, Kaisner, Dolan, Duryea, Upson, Hoey and Daly did not appear.

The contest was waged with varying fortune, as the scores will show, no one of the contestants taking a strong lead at any time, which would indicate him a reasonably sure winner. Welsh and Chapin tied on 89, and they agreed to divide first and second moneys, \$585, and to shoot the match to a finish for the cup, Welsh winning in the shoot-off, killing 8 out of 9, while Chapin missed 3. Following are the scores:

Sistersville Rod and Gun Club.

SISTERSVILLE, W. Va., Feb. 23.—Very cold and disagreeable weather again interfered with the success of our Washington's Birthday tournament. It began snowing on Monday and kept it up until about Tuesday noon, when the sun came out and made good scores simply a thing of an impossibility. We were, however, fortunate in having our club house well heated, which prevented much suffering from the cold. Among those from out of town were John F. Mallory, St. Marys; F. E. Mallory (Cole), C. L. Slayton and Patton, Parkersburg; T. S. Bibbee, Elba, O.; George Alfred and P. Schlicher, Jr., Marietta, O.; and Sol and Wilson, Wheeling.

The following are scores in detail:													
Events:	Ex.	1	2	3	4	5	6	7	8	9	10	11	T'

Dr Stathers													11

The club shoot for the Pelton trophy took place on the local grounds Saturday, Feb. 26, and was won by Dr. J. R. Stathers on the splendid score of 24 out of 25 blue rocks. Ed O. Bower.

Grand American Handicap Cup.

NEW YORK, March 5.—*Editor Forest and Stream:* Herewith you will find a cut of the cup to be presented by the Interstate Association to the winner of the Grand American Handicap, to be held March 23-24. This cup was made by the Bartens & Rice Co., 328 Fifth avenue, this city. It is solid silver and rests on an ebony base, making a total height of 18in., the cup being 13in. high, and is a loving cup with three handles. The support at the bottom of the cup consists of three hammerless shotguns, in the center of which is a trap and pigeon flying from same. In style the cup is Arabesque. It is certainly a magnificent cup, and there is a very handsome case for it.

This cup will become the sole property of the man who wins it, and whoever does ought to be proud to hold it.

JOHN L. LEQUIN, Sec'y-Treas.

Interstate Association Target Events

WESTERN TRAPS.

THE CHICAGO LIVE-BIRD CHALLENGE TROPHY.

CHICAGO, March 5.—There has been some talk lately, some of it of a not altogether pleasant nature, regarding the disposition of the surplus fund left after the entertainment of visitors in the Kansas City-Chicago shoot last December. It was the wish of many that this sum should be devoted to the purchase of a challenge trophy for Chicago shooters, but these expressions having been made by correspondence and not at a regular meeting of those concerned, nothing which could be termed of an official nature had transpired until this week. Mr. Rice, chairman of the Chicago entertaining organization, made arrangements for a badge, and rules, formulated as I understand by Mr. Rice, were published in a local paper. The latter rules, of course, represented nothing pertaining to the Chicago members of the entertainment body until after a meeting had been called and formal action been taken upon them. Such meeting was not held until Friday of this week, March 4, at which time proper rules were formally adopted, the above-mentioned draft being amended in several points, and two additional rules adopted.

The call for the meeting on this matter was sent out by Mr. Rice, chairman, on March 1. The following were present: T. P. Hicks, C. P. Richards, Ed Bingham, J. H. Amberg, R. B. Organ, W. P. Mussey, W. L. Shepard, H. Levy, E. S. Graham, S. C. Matthews, F. H. Lord, John Glover, Charles Morris, Mr. Comley, Dr. S. Shaw. Mr. J. Rehm sent regrets, stating that the majority action would be approved by him, and Messrs. George R. Thorne and W. B. Leffingwell telephoned to similar effect. Mr. Rice called the meeting to order. He stated the purpose of the meeting and went on to say that he had written to all those who had contributed to the entertainment fund, asking each man his wish in regard to disposition of same. The great majority had expressed the wish that it be applied for the purchase of a Chicago trophy. He had gone ahead and purchased such trophy, and had caused to be published a set of rules on which he had heard no criticism. He stated that he had paid for the medal himself, and if the gentlemen did not care to take it over as their own he would offer it himself. The treasurer's report showed that there remained a balance of \$133.08. The chairman passed up for reading a preamble and resolutions covering his action on this matter up to date. The resolution embodied the contemplated action, as follows:

"Be it Resolved, First, that said surplus be and is hereby dedicated to the purchase of a suitable trophy or badge to be offered, first, in open contest to and by all who may have contributed in a financial way to the success of the recent entertainment of Kansas City shooters. All contestants to be handicapped as hereinafter provided. The holder of trophy as a result of the first open contest shall be subject to challenge as herein set forth. Suitable rules, to be hereafter adopted, shall govern in all contests for said challenge trophy."

It was now suggested that to make the action regular there should be a meeting of the executive committee, and not of the general organization. There were present of this committee: Messrs. Richards, Rice, Shepard and Hough. Mr. Rice called the committee together. The president's report was accepted and all the officers and committees of the original organization were discharged. The committee adjourned, and this was equivalent to the formal disbandment of the Chicago-Kansas City organization.

On motion those present now went into committee of the whole, and Mr. W. L. Shepard was elected to the chair. Mr. Richards remarked that the badge had cost \$150, whereas but \$133 was left on hand. Mr. Rice politely offered to make up this deficit. It was carried then that we accept the badge as shooters of Cook county, and direct the treasurer to turn over the \$133.08 to Mr. Rice. A vote of thanks was extended to Mr. Rice for his donation.

On Mr. Amberg's motion the draft of the rules aforementioned was taken up and voted upon section by section.

It was voted that the contest be open only to contributors to the Kansas City entertainment fund, and that the first shoot be called for the first Wednesday in April.

Mr. Mussey then made the following motion, which he stated he desired to have adopted as a preamble to the rules:

"All persons desiring to enter for this contest shall make their entry and shall post each \$2 forfeit at least ten days ahead of the first contest. Failure to shoot shall forfeit \$2, the same to be paid over by the handicapping committee to Mr. Watson." This prevailed.

Mr. Mussey moved that in Sec. 1 the word "pigeon" be substituted for the word "birds." Carried. Sec. 2 was passed without change. Sec. 3 was on Mr. Rice's motion made to embody ratification by "general meeting of Chicago sportsmen" instead of the "executive committee." Mr. Mussey moved a substitute for Sec. 10, which substitute was adopted and is shown as Sec. 10 in the complete copy of the rules found below.

Mr. Mussey then moved the adoption of the following to be added to the rules: "In case any legitimate contestant shall win this trophy six times, it shall become his property." This motion prevailed and was made part of the rules, as Sec. 14. Mr. Hicks, seconded by Mr. Levy, moved that the trustees be elected by ballot, their term to be one year, or until their successors are qualified; said trustees to have power to fill any vacancy which may arise by death or resignation. This resolution was later engrossed and made part of the rules as Sec. 15, shown in full below.

A ballot was held for the three trustees. Messrs. Mussey, Shepard and Hicks were elected.

THE RULES.

The following is the official copy of the rules governing the Chicago live-bird challenge trophy. As stated above, they were guessed at earlier. If they are printed again this week elsewhere than in FOREST AND STREAM it will simply be a case of guessing again, for FOREST AND STREAM has the only official and correct copy of these rules. For record of current events it is well to consult the columns of FOREST AND STREAM. If you see it there it is so:

THE CHICAGO LIVE-BIRD CHALLENGE TROPHY.

1. All contests for this trophy shall be at live pigeons, contestants subject to handicap, either by what is known as the bird handicap, or distance handicap, one or both, as may appear best and proper to the committee having the matter in charge.

2. All contests shall be at 25 birds per man, whether at first general or subsequent individual contests, and shot under rules known as the American Shooting Association rules, except wherein the following rules may differ.

3. This trophy shall be placed in the hands of three trustees, such trustees having first been agreed upon at a general meeting of Chicago sportsmen held for the purpose of considering these rules.

4. It shall be the duty of this committee of three, first, to care for the trophy; second, to receive and preserve all bonds given by individuals who may, by winning, for the time hold said trophy; third, it shall be the duty of said committee, or a majority thereof, to properly handicap, according to the best information obtainable and their better judgment, all contestants for possession of said trophy, and if in their judgment a bird allowance in addition to a distance handicap be necessary to the equalizing of two shooters, then such handicap shall be by this committee, or a majority thereof, affixed, giving notice of such handicap to parties in interest.

5. Finally, this committee shall have entire and complete say as to the care of trophy, the bond that shall be accepted, all questions pertaining to handicapping, the appointment of referee, score keeper, etc.

6. After the first general contest, the holder of this trophy shall be subject to challenge for possession of same from any shooter in Cook County who is a member in good standing of any organized gun club.

7. All matches shall be at 25 live birds, the challenger posting a sum of money requisite to cost of 50 birds, and no more. The holder shall name time, giving challenger not less than ten days' notice, and shall, while our respected fellow sportsman John Watson continues to manage a shooting park, name such park as the place for contest.

8. The holder of this trophy shall be subject to one challenge each thirty days, and shall shoot, if requested to do so, within thirty days from date of challenge. A deposit of bird money, together with formal challenge, with the American Field, Chicago, shall be sufficient notice. No other forfeit money or stake shall be necessary except simply price of birds, the challenger in all cases paying for birds.

9. The trophy shall be delivered to the referee on the day of each and every match.

10. If the challenging contestant fails to appear on the day set for the match, unless in case of sickness or for other reasons satisfactory to the trustees, he shall forfeit his bird money, which shall be paid to the holder of the trophy. Should the holder of the trophy fail to appear, he shall forfeit the trophy to the challenger, who shall also have his bird money refunded.

11. In case holder of trophy is not in condition to shoot the race on receipt of challenge, he must immediately notify chal-

lenger and said trustees. Having satisfied said trustees of his actual inability to shoot, the same will be accepted; if not, holder of trophy must shoot or forfeit. In case of bad weather on day of match, the same shall take place on the first favorable day thereafter. No challenge will be accepted or recognized until after the winner or party challenged shall be so declared and known.

12. All challenges must be made in writing, accompanied by bird money forfeit, and deposited with the American Field, of this city.

13. If either holder or challenger of this trophy attempts to take any unfair advantage, such as misrepresenting shooting qualifications, setting time of match on the Lord's Day, or any other scheme to prevent an honorable and fair contest, he shall forfeit trophy and all right to further contests, and the duty of ruling upon these points shall rest entirely with the trustees herein named, whose decisions, or decision, by the majority shall be final.

14. In case any contestant shall win this trophy six times, it shall become his property.

15. The three trustees shall be elected by ballot, and shall hold their office for the term of one year, or until their successors are duly qualified; and said trustees shall have power to fill any vacancy which may arise by reason of death or resignation.

THE GRAND AMERICAN HANDICAP.

On March 19 a strong body of the best shots of the Western country will leave Chicago for the East to participate in the Grand American Handicap at Elkwood Park, N. J. There will be about forty-four of these men, representing eight different States, the party having been arranged by Mr. E. S. Rice, of the Du Pont Powder Company. The names of these gentlemen, as nearly as they can be determined from their expressed intentions at date, are as follows, the party including also several ladies:

Chicago: Mr. and Mrs. E. S. Rice, W. L. Shepard, Dr. and Mrs. S. Shaw, Ralph Kuss, John Watson, Ed Bingham, Silas Palmer, C. P. Richards, H. Woodruff, Dr. H. H. Frothingham, John Glover, Fred Lord, George Roll, Dr. and Mrs. C. W. Carson, Thomas Hicks.

Illinois: Hon. Tom A. Marshall, Keithsburg; Lee Huckins, Kewanee; Albert Bacon, Henry; E. E. Bacon, Kewanee; Wm. Dunnell, Fox Lake; Henry Dunnell, Fox Lake; Albert Dunnell, Fox Lake; Thos. Laffin, Rock Island.

Undecided: Mr. Chauncey M. Powers, Decatur.

Iowa: L. C. Abbott, Dr. Kibbey, Peter Densil, J. A. Lane, Marshalltown; Chas. M. Grimm, Clear Lake; Chas. W. Budd, Des Moines; Fred Gilbert, Spirit Lake.

Nebraska: Walter G. Clark, George Loomis, Frank Parmelee, Mr. Reynolds, Omaha.

Wisconsin: Dr. J. L. Williamson, Geo. L. Deiter, John Plankington, Jr., Mr. Bush, Milwaukee.

Undecided: Richard Merrill, Milwaukee.

Minnesota: Mr. and Mrs. Wm. P. Shattuck, Minneapolis; Dr. Lewis W. Lyon, St. Paul.

Indiana: J. C. Small, J. W. Hill, Aurora.

Missouri: J. E. Riley, Kansas City.

Undecided: James Porter, Lee Porter.

Arkansas: John Schmelzer, Jr., Hot Springs.

South Dakota: Mr. E. A. Leach, Tripp.

The party will leave here at 7 P. M. on March 19, over the Grand Trunk Railway. They will take in Niagara Falls, and from Buffalo will go East on the limited train of the Lehigh Valley Railroad. There is no need to announce the time of their arrival, for there will be a dull heavy jar in the neighborhood of New York when they get off the train. They go resolved to win first money again this year, and also resolved to bring back the Grand American Handicap to Chicago for 1899. They will be a fine lot of fine fellows, and will be sure to deserve the courteous treatment that has always been accorded them in the East. We in Chicago expect that first, second and third high guns in the greatest of all American shooting contests will come from the West, and if there is anything else lying around loose, we shall expect to have that also, to show there is no coldness. As to the handicapping, our men feel very sure there will be no discrimination against the West, nor against any other section; but should all the Western contingent be put at 40yds., we should expect to win, none the less. The West expects every man to do his duty.

PETERSON-RAY.

A race at 100 live birds, \$100, was shot at Omaha, Neb., Feb. 28, between George Peterson, of Coon Rapids, Ia., and Ray, of the Omaha Gun Club. The match came off at the grounds of the Omaha Gun Club, Mr. Frank Parmelee refereeing. The men tied on 91 out of the first 100. In the shoot-off at 25 birds, Peterson scored 22 and Ray 21, leaving Iowa the victory.

ERB-BECK.

On Feb. 28, at Indianapolis, Ind., Fred Erb, Jr., of Lafayette, won from George C. Beck, of Indianapolis, the Grand Hotel cup, emblematic of the State championship. The score was Erb 86, Beck 85. E. E. Neal, formerly of Chicago, but now of Bloomfield, Ind., has challenged for the cup. The race was shot on the grounds of the Limited Gun Club.

CENTRAL KANSAS SPORTSMEN'S ASSOCIATION.

The success of the sportsmen of Newton, Kans., in their recent tournament has led to the organization of another general organization of shooters. This will be known as the Central Kansas Sportsmen's Association, and will be composed of the gun clubs of the territory bounded by Atchison on the east, Arkansas City on the south, Abilene on the north and Dodge City on the west. Tournaments will be held every three months. This is merely a strong district organization, and does not conflict with the State Association, but will be governed by the rules of the latter. The following officers have been elected: George B. Dougan, of Newton, President; H. L. Ford, of Wichita, Vice-President; H. S. Montgomery, of Topeka, Secretary and Treasurer.

AT MILWAUKEE.

The Milwaukee Gun Club, of Wisconsin, held a two days' shoot Feb. 26 and 27. A very good turnout was on hand from adjacent towns. On the first day eleven events were run off, top scores being made by J. E. Farber, J. A. Ruble, of Chicago; Frank Van Ellis, George L. Deiter, Stephen Meunier, of Milwaukee; W. Schuchardt, of Merton, and Dr. Browall, of Palmyra. On the second day the weather conditions were better, and the shooting more satisfactory. The Wolf trophy contest was begun, but will have to be settled at a later time. Ruble and Browall having withdrawn, the trophy will be contested for by Theodore Thomas and J. L. Lewis, who both killed 10 straight. Thomas, Meunier and Himmelstein were among high guns on the second day.

COMING EVENTS.

The Ottumwa Gun Club, of Ottumwa, Ia., begin their season of shooting this week, and will shoot each Friday afternoon henceforward. They start in strong, and the membership is not apt to fall off during this year. The principal trophy of this club is the Clark and Mollison silver loving cup. This cup will be owned by the man winning it five times in the weekly contests.

Mr. C. E. Grun, of the Pipestone Gun Club, of Minnesota, writes that his club expects to hold a two days' tournament at targets and live birds at an early date, though the latter has not yet been determined. A good local attendance is anticipated.

The Timber City Gun Club, of Maquoketa, Ia., is a new club, but expects to have thirty-five members at its regular shoots the coming season. It is making active preparations for the campaign. The following officers have been elected: J. H. Brown, President; M. W. Clark, Vice-President; Will Cundill, Secretary; George Gurius, Assistant Secretary; M. N. Trumbo, Treasurer; and Guy O. Morse, Ground Manager.

COLLEGE CORNER.

At the weekly shoot of the College Corner, O., Gun Club for the club medal, Caldwell and Wright tied on 18, other scores being Bergan 17, Reid 16, Smoyer 6. Caldwell won the medal on the shoot-off. Mr. L. H. Reid, the secretary, writes me: "We shoot at 20 blue rocks, unknown angles. This is the first gun club we ever had here. We are getting some good guns here, and taking quite an interest in trap-shooting."

CHAGRIN FALLS.

At Chagrin Falls, O., March 1, a hot little shoot was held at 25 birds, with the following results, the Cleveland men showing in the lead: Charles Doolittle, Cleveland, 21; George Bennett, Cleveland, 20; Oliver Burton, 19; P. S. Brown, George Snow, O. Hall, Auburn, 17; Thomas Cathan, 15; Silas Childs, 15; T. D. Brown, Cleveland, 14; James Harper, 13; Burt Bennett, Dr. Leroy, 12; T. N. Bright, 11; F. Bradley, 10; Lloyd Whitney, 9; Paul Curtiss, 3; Frank Vaccar, 2. E. Hough.

IN CHICAGO.

A new trap-shooting club will be added to the Chicago list at an early date, made up from the membership of the Chicago Athletic Association.

AT ELGIN.

The Elgin Gun Club is getting up a series of contests for the Gold Dust cup, offered by the manufacturers of the Gold Dust powder. There will be six monthly shoots at 20 targets, the highest score in the six shoots to win the cup.

EUREKA ANNUAL.

The annual banquet and meeting of Eureka Gun Club, of Chicago, was held at the Leland Hotel on the evening of Feb. 22, the affair being informal, but very pleasant. Dr. C. W. Carson was in the president's chair and Mr. W. A. Jones at the secretary's place, others of those present being as follows: Messrs. W. F. De Wolf, J. L. Jones, A. C. Paterson, John T. Glover, Ed Steck, T. Frank Liddy, Joseph F. Forbrich, C. C. Hess, Hoyt Shaw, R. B. Carson, H. B. Morgan, W. H. Cornwell, H. Lord, E. H. Goodrich, F. F. Spreyng, Mrs. E. M. Steck, Miss Anna Liddy, Mesdames Joseph F. Forbrich, C. C. Hess, D. Thomson, C. W. Carson, R. B. Carson, H. B. Morgan.

The Leland served a very tasteful repast at nicely decorated tables. At 10 P. M. the ladies withdrew, and business of the annual meeting began, introduced by a brief speech by the retiring president. In the routine work it was shown by the treasurer that the income of the club for the year was \$845 and the expense \$695, this leaving \$150 in the treasury. The officers showed that the club was in a very solid condition, inventorying over \$1,000 worth of fixtures. A graceful act was done in remitting the dues of Mr. Thomas Marshall, who is a non-resident member of the club, who came at his expense all the way from Keithsburg to help Eureka Club in the Eureka-Garfield match last Saturday. On motion of Mr. Lord it was decided to provide a first and second prize badge for each class in the club membership, ownership to be decided by the twelve best scores in the club shoots of the season. The board of directors were instructed to hold an informal ladies' night banquet at some later time, this to be distinct from the regular annual business meeting. The club determined to send one or more teams to the interstate shoot next June. In the election of officers the following very satisfactory results were announced: President, F. H. Lord; First Vice-President, J. L. Jones; Secretary and Treasurer, C. C. Hess; Captain, A. C. Paterson; Directors, A. W. Adams, John T. Glover, E. S. Rice, W. R. Morgan, F. P. Stannard, L. H. Goodrich. Eureka Club is one of the stand-bys of this city, and it enters its career for the coming season fully equipped and enjoying the confidence of the shooting fraternity.

WESTERN SHOOTERS ATTENDING HANDICAP.

Arrangements have been made for the Western shooters attending the Grand American Handicap in March to put up at the Hotel Norwood, Long Branch, N. J., where everything will be made suitable for their comfort and amusement.

CICERO GUN CLUB.

Cicero Gun Club, of Oak Park, Cook county, held an all-day shoot at live birds on targets Feb. 22 at its grounds, west of Chicago. The weather, although cold, was not particularly disagreeable to the few enthusiasts present. The grounds were covered with snow, making a low-flying white bird hard to find; and the birds were as fine a lot as were ever trapped on our grounds, not one of them remaining 10 seconds at the trap. They were three-quarters carrier pigeon stock. The events were as follows:

No. 1, five live birds: Barnard 3, W. Einfeldt 4.
No. 2: W. Einfeldt 3, Nusley 4, Jennings 1, D. Einfeldt 1, Furbeck 3, Barnard 2.
No. 3: W. Einfeldt 4, Nusly 4, Jennings 2, Furbeck 2, Kittlestrings 5, Barnard 4.
No. 4: W. Einfeldt 3, Nusly 3, Jennings 1, Furbeck 2, Barnard 3, Odell 3, Kittlestrings 3, Thurber 3, Billing 3.
No. 5: Einfeldt 2, Nusly 3, Jennings 2, Furbeck 3, Barnard 5, Odell 4, Kittlestrings 4, Thurber 3, Billing 3.
No. 6: Einfeldt 5, Nusly 2, Jennings 0, Furbeck 3, Barnard 4, Odell 2, Thurber 1, Kittlestrings 5, Lowrey 3.
No. 7 was a miss-and-out on the remaining birds, and was divided by Einfeldt and Barnard, each killing 3.

Some target events followed. The snow was very trying on the eyes of the shooters. At the live birds Furbeck was using too long a shell for his pump, and this lost him several birds.

CICERO.

STONY ISLAND GUN CLUB.

CHICAGO, Feb. 22.—The Stony Island Gun Club held a shoot today on its grounds at the corner of Ninety-fifth street and Stony Island avenue. The main event was No. 5, at 10 birds, \$2. The prize was a box containing 100 shells. Illinois State rules governed. Dr. Larkin won the prize.

L Willard.....111111211 —10 S Zimmerman.....111210021 —8
Capt Fyfe.....010102012 —17 Dr Larkin221110111 —1-10

E. PORTER, Sec'y.

STONY ISLAND GUN CLUB.

Chicago, March 5.—The following event, for the live-bird medal, was shot to-day, at 10 birds, Illinois State rules:

S G Zimmerman.....0220212100—6 Ties.
L Willard.....211102112—9 211121102—9 11101—4

C. Porter is holder of medal. E. PORTER, Sec'y.

Owego Gun Club.

OWEGO, N. Y., Feb. 23.—Herewith are scores of the sweepstake shoot of the Owego Gun Club over their new magautrap on the 22d. It was most successful. In May the club intends giving a three days' shoot, one of which will be devoted to live birds. All will be invited except professionals and experts. No. 10 was at doubles:

Under date of March 3 Mr. John L. Lequin, secretary-treasurer of the Interstate Association, writes us as follows: "It seems to be essential that another notice should be given to all probable contestants in the Grand American Handicap that the entries will close on March 17. Post entries of course will be taken up to the time the last man fires at his second bird by paying \$10 extra, or \$35 in all, instead of \$25, if received on or before the 17th of March."

Trap Around Reading.

READING, Pa., Feb. 22.—The Washington Birthday shoot of the South End Gun Club, of this city, was a grand success, and the events, which constituted the programme, were all well filled. Many visiting sportsmen from nearby towns came and shot in different events. Among them Clouser, C. Eshelman, Diefenderfer, Batdorf, representing the Gibraltar Gun Club; Ritter, of the Independent Gun Club; Kilpatrick and Fleck, of the East End Rod and Gun Club—all took part in the different events. The club shoot, event No. 5 on the programme, proved the most interesting. Each man shot at 25 targets, thrown by the magautrap. Two handsome medals, one of gold and the other of silver, were the prizes, but have to be shot for at twelve holiday shoots, the person scoring the most points gets the gold badge, and second highest the silver badge; first to count 5, and second 3. Honest Davy Knaib was referee and rendered all his decisions in a fair and impartial manner.

Shaaber hit 24 straight, then dropped his last bird. He won the club shoot, with Capt. Wm. Essick second with 23 hit. Shaaber used an L. C. Smith ejector gun, with 42grs. of E. C. powder, while Capt. Essick also used an L. C. Smith gun.

The following are the scores:

Events:	1	2	3	4	5	6	7	8

* Denotes guests who helped fill up squad.

Lebanon, Pa., Feb. 22.—The Keystone Gun Club, of this city, this afternoon defeated the Shuler Shooting Association, of Pottstown, by a score of 76 to 73. Ten men shot on a team, each at 10 birds apiece.

Gibraltar, Pa., Feb. 22.—Chas. O. Eshelman and Geo. L. Diefenderfer shot a novel live-bird match at the Gibraltar Hotel. Mr. Eshelman used a common rifle, while Mr. Diefenderfer used a 12-bore gun. The match was at 10 live birds each. Eshelman shot 10yds. from the trap, while Diefenderfer stood 25yds. from the trap. Score was as follows:

C O Eshelman.....0010101000—3 G L Diefenderfer.....111111010—8

Lancaster, Pa., Feb. 25.—Wm. Fieles, Christiana, this afternoon defeated the Sprenger Lancaster county live-bird championship trophy in the fifth live-bird shoot held for it. Fieles and Wm. Krueger tied on 18 birds out of 20, and in the shoot-off Little Willie Fieles killed 9 out of 10 birds to Krueger's 7. The other shooters scored as follows: Galbraith 15, Hook 8, Gladfelder 15, Rider 14, Baltz 15. If Fieles wins the next match the costly trophy becomes his absolutely, it being necessary to win three matches straight to become its actual owner.

Pottstown, Pa., Feb. 26.—A largely attended live-bird and target tournament was held here to-day by the Shuler Shooting Association. The principal event was a live-bird match between F. C. Clayton (Butler), of Philadelphia, and Harry Trumbauer, of Royersford. Clayton won by 24 to 23. The conditions were 25 birds per man, \$25 a side, American Association rules governed the contests. Trumbauer allowed Clayton to score his first miss a kill.

Norristown, Pa., Feb. 26.—At the Washington Gun Club, of Conshohocken, Thomas Smith defeated Paul Johnson this afternoon at 25 live pigeons by the score of 20 to 19. Another match at 5 birds followed between George Righter and Harry Haines resulting in a tie, each killing 2 birds. A sweepstake followed at 25 birds per man, with the following result: F. Johnson 18, Motz 17, Kriebel 22, Jackson 19, Williams 14, Keyser 18, Righter 16, H. Johnson 21, McKenzie 10, J. Smith 9, H. Haines 9.

ARTHUR A. FINKE.

Dansville Gun Club.

DANSVILLE, N. Y., Feb. 25.—The Dansville Gun Club held its regular practice shoot to-day. The weather conditions were the most unfavorable for good shooting that we have had to meet so far in our sport.

The club used to-day for the first time the Sergeant system of arranging and working the traps, and we shall no doubt hereafter use that system at our practice shoots, as it seems to be the unanimous opinion of those present that that style of shooting adds interest to the sport; but it knocked our averages higher than Gilroy's kite, as the following scores will show:

Events:	1	2	3	4	5	6	7	8	9

WILLEY, Sec'y.

West End Gun Club.

DAVENPORT, Ia., Feb. 26.—I was called out of town on business and could not furnish the reports as promptly as they should have been, but hope you will use them, even though late.

Our first day opened up with fairly good weather and a promising attendance, but the morning of the second upset our hopes. The wind blew a hurricane, and with snow enough already down to stop street car traffic, it came thicker and faster for two days. This cut our attendance to about one-third of what it would have been with average weather. The boys had a good time, however.

First Day.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, MARCH 19, 1898.

VOL. L.—No. 12.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

WEAPONS OLD AND NEW.

IN illustration of the isolation and antiquated ways of some of the mountain dwellers of Kentucky, it is said that not long since it was discovered that the cross-bow was still employed by them for hunting. If there actually exist Americans who hunt with cross-bows, may their tribe increase. Surely they come nearer than the user of magazine rifle or "pump-gun" to exhibiting that phase of sportsmanship which insists on "pitting one's skill against the cunning of the game." The ruder, cruder, less efficient the weapon, the greater the skill called into play to do execution with it; and the more real the "pitting."

As a matter of fact, in a large proportion of the hunting of the day, the "pitting of skill" is altogether imaginary, fanciful, assumed, and conceded by courtesy. We are forever prating about giving the game a fair chance, and yet all the while seeking weapons that will shoot further and more rapidly and more fatally. The pride of a sportsman is to have the very latest armament, which means the most accurate, certain and deadly equipment to be bought for money. Every step in perfection of shotgun and rifle, powder and shot, bullet, shell, and cartridge, means added facility of game killing, and just so much increased disparity between the shooter and the game at which he shoots. Our discussion of guns and rifles is always as to which is the better of two bores or calibers, and which is the best of all, which means the furthest shooting, the hardest hitting, the most certain to bring from air to ground the most birds in the shortest time, or to "down" the biggest game in its tracks. This is as it must be, in the nature of things, in keeping with the laws of progress. We would be less or more than human if we failed to demand the latest, best and most perfectly adapted to its purpose in our firearms, precisely as in all other equipments of modern life.

But though supplied with weapons a thousandfold more powerful and certain than the antiquated cross-bow, is the shooter of these last years of the century after all so much of a craftsman as his rudely armed fellow of the Kentucky mountains? Is he so close to nature? Does he know the woods and the game so well? Which of the two pits his skill against the cunning of the game? To suggest such speculations is to answer them.

If the Kentucky hunter should make a proselyting tour, to convert shooting men to his faith in the antiquated arm as a suitable hunting weapon, his unanswerable contention might be that a general substitution of cross-bows for repeating arms would tend powerfully to the nurture of the game supply. And once rid of the now all prevailing notion that one's arm must be the most killing engine that the ingenuity of man can produce, the new devotee of the weapon of Robin Hood would find in its use many of those delights of woodcraft to which many a cartridge-belted knight is and ever must be, a stranger.

We commend the cross-bow to those dissatisfied mortals whose lot is cast in barren hunting grounds; they can get more hunting out of a small store of game with the ancient weapon than with the newest fangled gun of the day. A single solitary old bird, like Mr. Hammond's "One-Eyed Grouse of Maple Run," if hunted with cross-bow and bolt, will last for many seasons, whereas a pump-gun belching factory-loaded ammunition would close the campaign in a day or an hour. Podgers, in another column, professes to have reverted to muzzle-loader ways with great delectation; now let some other devotee out-Podger Podgers by making venture of the cross-bow.

THE BIRDS OF GLOUCESTER.

THE great wrong and injustice unwittingly wrought by the Massachusetts Legislature, through the act governing shooting on Cape Ann, should have the earliest practicable reparation. The circumstances were related by our correspondent Hermit in our issue of last week. The Massachusetts game law was so amended last March that it forbade shooting land birds on Cape Ann within certain limits, including Rockport and seven wards of the city of Gloucester, but not covering Ward Eight of that city. The effect of this, as demonstrated last season, was to close a tract of twenty-five square miles of shrub land and forest; to shut out from this territory the army which had been wont to shoot over it, and to turn en masse upon Ward Eight the entire shooting contingent of a population of 35,000. The result, disastrous and pitiful, was told by Hermit last week, and the picture is worth repeating:

Any one with brains enough to think knows the result, namely: Woods and shrub lands alive with gunners; reckless shooting at every moving thing; human life endangered; game and song birds exterminated; Sunday law violated, and people who take the day for a pleasure stroll in the woods are forced to retreat under fire, menaced by the hurtling shot or the spiteful zip of the small rifle bullet.

The gunners that crowd Ward Eight are not sportsmen as a body. A few sportsmen follow the hounds, and a very few tramp the woods for game; these men do not shoot song birds, but the average gunner shoots everything in fur or feathers.

Bond's Hill is a great resort for robins in migration. Food is plentiful, such as black cherries, choke and poke berries. Last fall there was a constant roar of guns on the hill, and later not a robin was left where there should have been hundreds.

It is well known to the readers of FOREST AND STREAM that I feed the song birds that come to my cabin dooryard. In migration large flocks of white-throated sparrows, fox sparrows, tree sparrows and black snow birds favor me with visits. Early last fall the flocks were destroyed or frightened away. The tree sparrows and black snow birds winter with me. Not a tree sparrow is left, and fifty or more black snow birds are reduced to a remnant of six. My flock of chickadees was reduced one-half. The tame ones that would eat from my hand were killed—all but one.

The slaughter was fast and furious when the season opened. Now one may walk the woods for days and not see so much as a squirrel. I appeal to the friends of song birds!

Surely no such effect of the Cape Ann prohibition was contemplated or anticipated by the Legislature; and now that the practical working of the law is shown to be so pernicious, no time should be lost in providing the simple remedy of including Ward Eight in the protected area. A petition to this end was recently submitted to the Committee on Game, and refused. It cannot be possible that the true condition of affairs was adequately set forth to them.

GAME PROTECTION IS A PUBLIC TRUST.

At the recent meeting of the Illinois Sportsmen's Association the plan of exacting a license fee from shooters for the privilege of shooting was suggested as offering a means of providing funds for the maintenance of a game warden force. The State, it was said, had steadfastly opposed appropriations for the purpose, and the money must be supplied then by the class directly interested in game protection. If shooters want something to shoot, the argument ran, let them pay the expenses of providing it; if they want game protected, let them protect it; the matter concerns them; it does not concern the community at large.

But the matter does concern the community, and the whole community—both that part of it which goes afield and that part which remains at home. Altogether aside from any consideration of the game supply as a food resource is the influence it has upon the health and stamina of the race, as an agency promoting physical development and well being. This is not in any degree a fanciful consideration of the game supply as a public benefit and game protection as a public charge; it has on the contrary had recognition from early days, and has furnished reason for the enactment and enforcement of game laws. It was true in the days of George Washington, who was an illustrious example of the sportsman who was a more useful citizen because of his sportsmanship, and it is true to-day when we have at the head of the Navy Department a Secretary who has himself more than once in eloquent public speech borne personal testimony to the strengthening and upbuilding influences of the Maine forests. The whole country reaps the advantage when its public men seek the woods for their chosen recreations; the individual community shares the good which its citizens find in camp and field. The

game which prompts to woodland excursions and rewards wilderness outings, it is the right and duty of the State to maintain. Game is public property; those appointed to protect it are the trustees of the public; game protection is a public trust.

PETARDS AND BEAR TRAPS.

THE fatalities self-inflicted by contrivers of deadly engines contributed to the language centuries ago the colloquial phrase "hoist by his own petard," and the expression is still used to-day, when we know nothing of petards. By some malign fatality, spring-guns and set-guns, when arranged for execution upon human beings, are more frequently a menace to the people who set them than to those for whom they are intended. The spring-gun item is encountered month after month in the press dispatches, but it is almost invariably the man who sets it who suffers from it. The set-gun is forbidden by the statutes, but gardeners with melon patches to protect and country storekeepers intent on dealing summary justice persist in setting the deadly contrivances and then walking into them themselves. So universal is the principle that the prohibition against setting spring-guns might fairly be classed as legislation making attempts at suicide a crime.

In one form and another the set-gun is widely distributed over the earth. In his description of Tartary, Hue relates that deceased Tartar sovereigns having been interred with great stores of treasures, the tombs were protected by a kind of bow, or series of bows, so ingeniously contrived as to discharge a number of arrows one after the other. The act of opening the vault door would discharge the first arrow, that one the second, and so on to the last.

Traps set for animals also claim their quota of human victims, who unwittingly walk into bear traps and deadfalls. In Maine log traps or deadfalls for bears are often made; and sometimes the contrivance is a miniature log cabin, having in the front a lift-up door, and a spindle in the back of the house to hold the bait; when the bear enters and touches the bait, the door falls behind him and he is captured alive. The late J. G. Rich, of Maine, used to tell of a trapper who, having constructed such a trap, accidentally sprung the door and was imprisoned, and sustaining life on the bait intended for the game, barely lived until rescued by a search party.

SNAP SHOTS.

Grand Rapids, Mich., announces a fly-casting tournament next June for "the world's championship." There is nothing in the Decalogue nor in the Bill of Rights of the State of Michigan to forbid the anglers of that enterprising town bestowing a "world's championship" medal and title on the winner of their tournament if they are amiably disposed to do so. On the other hand, there is nothing in international law to compel foreign anglers to recognize the earth-embracing championship pretensions; and it is just possible that in their designation of the character of the event the ambitious projectors have gotten out more line than they can retrieve.

The New England Sportsmen's Association is to be most warmly congratulated upon the realization of its plans in the magnificent exposition which is now delighting Boston.

Senator Hoar, who has an unflagging interest in the protection of song birds, on Monday of this week introduced a measure forbidding the importation into the United States of birds or their feathers for ornamental purposes, and imposing a fine of \$50 for each offense.

The ready, speedy, effective and sensible solution of the problem of an over supply of deer on Long Island would be found in the adoption of the suggestion made in these columns some months ago, to establish an inclosed deer park by the State Game Commission, within the confines of which the deer stock might be perpetuated, and the surplus distributed to Ulster, Greene, Sullivan and other counties whose native deer stock has been depleted. Such a Long Island deer park would be a permanent nursery, constantly growing in value and importance as a factor in the game supply.

The Sportsman Tourist.

Just About a Boy.—VIII.

ONE Saturday in June the boy walked into the shed where I was painting a new canoe, sauntered around the boat and inspected it with critical eye, squinting aft from the bow and "lining up" the bends.

"Good job that. Got 'er's even as one an' one. Ought to be a gickaloodin traveler."

"Ought to be what?" I asked.

"A gickaloodin traveler. Don't ye know what that means?" he answered with a grin.

"No, I never heard that before."

"Well, that's the same as good only it's better," he replied. "Learnt that from an old feller that ust to live down on th' Missouri River, name o' Poo Gee. He ust to always say 'Poo Gee!' ever' time what he felt like swearin', 'n' that's how he got his name. Don't know what his real name was, er nobody else, I guess. Everybody juss called him Poo Gee. He had a lot o' names fer things, like gickaloodin 'stead o' good, 'n' joistaboomerang fer a floatin' log. 'N' one o' these logs 'at seesaws up 'n' down in a current he called a joistocutens, nen a pine timber he called a pine joistus."

"He's a queer ole feller, 'n' 'bout half crazy, I guess; but he knowed how to fish 'n' hunt all right, 'n' lived in a kind o' shanty down there fishin' fer market."

"Well, he must be a character."

"Oh, he's dead now," answered the boy.

"Say," he said, changing the subject, "less go out 'n th' woods 's afternoon, will yeh? I'm feelin' kind o' lazy 'n' no account like, 'n' want to go somers. Don't want to go fishin' 'n' hain't nothin' to shoot, but I juss got a resless notion I want to go out 'n th' timber. If I hook up 'n' come over after dinner, will yeh go 'long?"

"Yes, I guess so. We might take the rods along and fish some too," I suggested.

"Nope," he answered, "don't want to fish, juss want to lazy round in th' shade somers where they ain't nobody to bother."

"All right," I answered, laughing. "If that's the way you feel I'll just go and loaf away a half day too."

"All right, then, I'll be over about one with the buggy. So long."

Then he sauntered up the walk, one hand thrust deep in his trousers pocket and his broad hat tilted at a dangerous angle over his right eye; under the flecking shadows of the grape arbor and out of sight, strolling lazily, but with the easy grace that is as natural as breathing to the outdoor man.

It is health and unconscious strength that makes the springing step and the easy, supple roll in the gait—a mark that nature puts on her gentlemen.

In the early afternoon we drove out into the country, past the growing crops, past the shady hedges, past the farmhouses where busy housewives hastened through their many occupations, oftentimes accompanying their movements with simple song, not very musical, it is true, but from satisfied minds that helped lighten labor.

The farmhouse dogs ran out as we passed and fretted themselves unnecessarily, barking until we were well away from the house. We drove contentedly and unmindful of these things, chatting in a lazy way befitting the day and the trip, the boy pointing out places along the route where he had had sport with the shotgun in other days.

A butcher bird flitted out of the hedge and across the road, alighting on a barbed wire fence. The boy's quick eye noted that the bird carried a burden, so he pulled up the horse and we sat watching.

The bird eyed us suspiciously for a few moments, and then, satisfied that we meant no evil, deliberately impaled his burden on a barb, flicked his beak with a side-wise motion on the wire and winged his way across the field.

"Know what he was doin'?" asked the boy.

"No, I'm not up in that fellow's ways," I answered.

"He's hangin' up his supply o' grub. See, he's got a lot o' truck strung along the wire. Whoa, Bill! Less go over an' see what he's got."

We jumped out and inspected the wire, finding two mice, some big brown crickets and nearly a dozen big grasshoppers, besides some other insects of the beetle variety.

"See, he's layin' in a stock o' grub," said the boy. "Now you'd think he'd eat all o' them things after he went to the trouble o' ketchin' 'em 'n' hangin' 'em up, wouldn't yeh?"

"Yes, I should think so," I answered.

"Well, he don't," said the boy. "At least he don't always, 'cause I've found this kind o' a layout right in winter, 'n' everything on the wire 'd be as dry as powder, 'n' a mouse 'd starve tryin' to live off o' 'em. These butcher birds, shrikes er shrikes er somp'n like that, I b'leeve is the right name of 'em, seems juss to have a leanin' too-words killin' things 'n' leavin' 'em stuck 'round this way. They are cur'ous kind o' birds, anyways."

The boy went on enlightening me on the ways of butcher birds as we circled toward the river. We soon went into the gate and through the blue grass pasture, where the big walnut trees grew in the sandy flood-washed soil of the river bank.

"Here's a good place. Less stop," said the boy, and out he leaped, unhooked the horse, slipped his bridle and turned him loose. We stretched at length on the dry sand that the last rise in the river had left there in the shade of the huge walnut trees, and I filled my pipe for a smoke, while the boy folded his hands behind his head, elevated one knee over the other as he lay flat on his back, slowly chewing a grass stem and looking up through the meshed tangle of leaves at the white clouds floating lazily across the blue dome.

"Gee, it's a long ways up to them clouds, ain't it?" he said. "I'd like to go up 'n a balloon er somp'n 'n' look down at the ground. Bet it'd look funny fr'm way up there, nen a feller could see a nawful long ways too. Reckon he could see most to the Missouri River, couldn't he?"

"Perhaps," I answered. "But I rather think he

couldn't see much even if he could see that far. It is about sixty miles to the river in an air line, and in this atmosphere everything would be lost in a haze. In the mountain country you can see that far easily, for you are up in the air and everything else is too, so the haze don't bother much."

"Say, gee! I'd like to go to the mountains. It must be a nawful purty place, nen, gee! couldn't a feller have fun ketchin' trout 'n' shootin' deer 'n' things! But it's a nawful long ways, 'n' I don't reckon I'll ever git there," he continued, as the smile faded and a dreamy, far-away look came into his bright eyes.

"Oh, I don't know, it wouldn't be such a long journey even with a team and wagon," I answered. "Three or four weeks would take you from here to Denver, and another week would take you right into the hills."

"Gee! less go!" said the boy.

"Well, we can think of that later, and arrange for a hunt that way this fall perhaps," I answered.

"I'll juss go you."

The boy was no longer indifferent and "feelin' lazy," but was alert and talking like an old woman's tea party about the mountains and the great stretch of sun-burned plains that met the sky to the westward of the little river. The sun swung across the blue dome and the shadows reached from bank to bank across the stream before his excitement cooled down enough to think of going home.

When I suggested that we move he tilted his hat down over his eye, squinted at the low-hanging sun and slowly rose to his feet. Gathering up the bridle, he whistled to the black pony and stood waiting for him to come up. The pony understood him too, and came slowly along, nibbling at a tender bunch of grass here and there, reluctant, but knowing that the boy's will was law, and soon he stood hitched to the buggy and ready for the homeward drive.

Back along the country roads we went, the pony suiting himself as to gait, while we chatted and enjoyed the ride, noting the passing landscape and the wild things that were the life of that perfect evening—truly one of those "rare June days."

EL COMANCHO.

Camp of Two Cranks.

White Water River, Indiana.

(Continued from page 204.)

On going down to our wash stand, three or four rods below the tent, at a place where we could get down to the water without jumping off the bank, we found the stream 4 or 5 in. lower than it was the evening before, and considerably clearer, caused, as we figured it out, by the stopping of the mill above over night, as after an hour or so it began to rise again and get milky and muddy looking as before.

Tom bewailed over the condition of the water, and I got in a few bewails myself to encourage him, till he came near forgetting to put the coffee in the pot when we had the breakfast about ready. (Always make your coffee at the last, and you have it at its best, as my old friend Joe Githens used to say, "you get the full aurora of it.")

Tom wound up his bemoaning with "no wonder the bass won't bite much, when they can't see a minny 3 in. from their nose," and we sat down to breakfast with fried cat and bass for the main attraction; these fried in the extra frying-pan by themselves so we would be sure to get the full "aurora of 'em."

While fishing along the rips after breakfast Bill came through the corn with his big bucketful of the finest kind of chubs and black "riffle suckers," at least twelve dozen in all—enough with those we had to last us over a week, even had the water been clear. He got his pay for the minnows, talked fish a while, relieved himself of a budget of village and neighborhood gossip that he was "bustin'" with, inspected our camp to his satisfaction and took his departure, turning at the edge of the corn to say, "I'm comin' up this way Sunday mornin' to shave an ole feller 'bout two mile above, an' then I'll come back an' stay with ye till yer ready to pack up in the evenin' an' start to town. I'll come up with Dais', an' ye know Dais' don't low no grass to grow under her feet, so we needn't leave here till after dark if ye don't want to. So long," and he was off through the corn, and a minute or so after we heard him talking to Dais', and then the quick hoof-beats on the pike and the rattle of the wagon, as they went flying toward town.

Bill was a village "character," we learned from a neighbor, who had seen better days. Four or five years before he had been left a snug little fortune of several thousand dollars by a relative, but an overfondness for "John Barley Corn" and the treachery of pretended friends had cleaned him out of his last dollar, and now he was "grubbin'" 'round the hotel for his board and wash and an occasional quarter maybe; however, he was as happy as a lark, and didn't seem to have a care in the world.

"Bill has a heart in him as big as an ox," said our informant, "and is always ready to go out of his way to do a friend or neighbor a good turn. Bill knows everybody in the village and surrounding country, and everybody knows Bill and likes him, but his besetting weakness keeps him down, more's the pity, for Bill is a good fellow."

Other Bills there are in the land who are in the clutches of "Mister Barley Corn," more's the pity too.

When Bill had gone I selected a couple of dozen minnows, and putting them in an extra bucket took my way up the stream to fish some likely looking holes we had seen the day before as we went up in the wagon, leaving Tom to fish near the camp and keep an eye on it, which he said he preferred to wading the creek a dozen times or more without rubber boots; however, he's rarely in a thoroughly good fishing humor till he's wet to the knees at least, and I have known him on one or two occasions to slip off a steep bank into a deep hole and go out of sight, but come up "a-puffin' an' a-smilin'," crawl out, build a fire, dry his clothes a garment at a time and go to fishing again as if it were a part of the regular performance. I poked along up, wading the

stream now and then when it was shallow and only a rod or so in width, fishing a hole here and there, without getting a symptom of a bite in the most "fishy" looking places.

About a half mile above camp the stream made another elbow, running squarely against the foot of a bluff near the road, at which point there was a long, deep, quiet pool, except for a slight current in the center, made by the rush of water at the tail of the riffle above, that I was willing to wager had bass in it that would run from 1 to 5 lbs. and over, and I was hoping to go back from there to camp with a string of 'em that would rattle Tom so badly that he couldn't tell the butt of his rod from the tip, or when supper time came. Up near the head of the pool, on the side of the stream I was on, the bank was 15 or 18 ft. high and nearly straight up and down, and with no beach along its base to afford a toe hold even; this condition due probably to the wash of former floods. Nearly at the extreme head of the pool was an immense sycamore stump that the floods had caused to slide down till its naked roots on the outside were deep in the water; its top being 6 or 7 ft. below the level of the top of the bank. Around back of the perpendicular wall I made my way up a gradual slope from the sandbar on which I stood, through thick bushes and briars, to where I could look down on the stump, the point from which I wanted to do my fishing. With minnow bucket and rod in one hand, I slid down the steep bank till I found a safe footing near the old stump, and the fun was about to begin—in my mind. I hooked on a big chub and cast out in the gentle current a few yards from the bank and let the line run off the reel till the minnow was 150 ft. away, down toward the bluff, and then reeled in quietly and gently till the minnow was almost directly under me along the submerged roots of the stump. This performance was repeated a dozen times or more without a strike.

"Curious," I said to myself, "if there are any bass in the stream from source to mouth they ought to be right here in this pool," and then I cast across toward the further bank several times, and away down and across to near another great stump anchored out in the stream with water all around it—a famous place for a big bass to harbor. No strike, after covering nearly every available square yard of water in the pool. Then I "still-fished," with a cork on the line, along the mass of roots beneath me, where the water was 10 ft. deep, till I was tired of holding the rod, and with all this patient, careful, conscientious fishing I had failed to get a solitary nibble.

I had started in to paralyze Tom with astonishment at the string of bass I would take out of that hole—but I didn't. "The de'il take the luck and the bass," I said to myself—probably these were not the exact words—and I reeled up, pulled up the minnow bucket from the water where it had been hanging by a piece of strong twine, climbed to the top of the bank with the aid of a friendly bush and headed up stream again, thoroughly disgruntled and chock full of disappointment for a few minutes, for never was there a likelier looking piece of water for a big bass, and never had an old crank fished it with more care and anticipation.

I waded across the stream a short distance further up and fished a few minutes in a less promising hole and didn't get a bite, but I didn't care much, for I was getting used to hard luck and poor fishing, or both, as the case might be.

A few rods further along the stream swung around to the right, toward Yanketown, and I followed it along, wading a good part of the time and fishing a little occasionally in a strip of deep water here and there, till I came to the outflow of the tail race of the flouring mill.

Here was a mighty enticing looking place for bass, and I hoped to make up for the time wasted below, but a half hour's careful fishing failing to get a strike or any sign of one, I went back to the ford, and following the dirt road out to the pike took the back track for camp, nursing a large notion that I would have to begin all over again and learn how to fish for bass.

When I got to the lower end of the big pool, which I could overlook from the road 40 or 50 ft. above it, and which I could have jerked a stone into, I set my face resolutely against its allurements and passed sturdily by and down the hill 100 yds. further on to the stream below, splashing heedlessly across it at divers riffles and shallow places, to save distance, looking hardly to the right or to the left, till I reached the camp in a frame of mind that was little less than "overpowerin'." And yet after thinking it all over I was not so much disappointed after all; I had really enjoyed the tramp, even though I had failed to stir a fin, for it was a perfect day, soft and hazy and dreamy, and the woods and hills along the river were resplendent in their October dress of red and gold and russet brown. Verily, to quote again, "It is not all of fishing to fish."

Tom was fishing at the lower ripraps, but set his rod when he saw me and came up to camp. I was looking for it and it came.

"What luck, Hickory?"

For answer I pulled my fish stringer out of my pocket, still unrolled, and laid it on the table, and then the graceless rascal sat down on a camp stool and rocked himself back and forth with his hands on his knees, and laughed till I felt like pitching him over the bank into the river. Looking at it from Tom's point of view I had to join in the laugh, and when we got through we built a fire, made a hasty pot of coffee, ate a cold bite and went down to where he had left his rod, and the "snickerin' cuss" pulled up out of the murky water a string of five fair-sized bass, and reaching for another stringer near by lifted out on the rocks a couple of catfish, one a "yaller cat" of about 1½ lbs., and the other a channel a trifle heavier than the other one, and then he chuckled some more. He had been "a-layin' for old Hickory" for many moons, and now that he had "wiped his eye," so to speak, on two different days he was tickled to the core.

I left him sitting on his rock that he said he had stuck to all day, and with rod and minnow bucket followed the path along the bank through the bushes to a point 20 or 30 yds. below, where the stream widened and got deeper, and went to fishing in just about the right humor to jerk the jaw off the first thing that bit—bass, cat, carp or mud turkey. I put a very small cork on the

line a yard above the hook to keep the big black ruffle sucker I had hooked on from poking his nose under the rocks at the bottom of the stream; however, I rarely use a cork in bass fishing till I get too lazy to fish.

I made a cast well out in the stream, and sat down on a rock and watched the cork as the big sucker towed it around, jerking it under out of sight for an instant now and then till I got so lazy and sleepy that I could barely keep the rod tip from dropping in the water.

Looking up after a jerky nod, I found the cork out of sight, and the line tightening as something pulled at it, going straight across the stream.

I took my thumb from the reel spool, letting the line run freely out, and got to my feet under the solemn conviction that I had a bite at last, but I could not make out whether it was bass, cat or turtle, and I didn't care much; it was a bite. I stopped the reel, and when the line tightened I struck with such a vicious swipe that I was moved to beg the old rod's pardon, but I felt like jerking the critter's jaw loose—whatever it was—to even up for the strikes I didn't get in the fore part of the day. Almost on the instant a bass went out of the water—I must have jerked him out—over near the further bank; a bass about the size of one of Tom's best ones, and then I waded up, and after a brief but vigorous fight landed my first fish of the day.

Tom couldn't see me for some trees and bushes that hung over the water between us, but he heard the splash of the bass and called down, "Git one, Hickory?"

I didn't answer, but strung my fish and went to fishing again, now fully awake and with more heart in it. I had poked on a big yellow chub, over 4in. long—tough, hardy fellows they are—made a cast in front of a fringe of willows below me that hung over and in the water, and sat down on the rock to draw a little solace from the old pipe and ruminate while waiting for another bite.

Suddenly the little cork went out of sight with a flip, and I got to my feet a little reluctantly, feeling a trifle cross-grained at having my reverie disturbed.

The line began to run off the reel at a rate that reminded me of some old times on the Tippecanoe River, and when at last I stopped it and gave the rod a side twitch, "Jumpin' Jehosafat!" I started a difficulty that would have done Tom's eyes good to see.

I knew by the feel that there was some tough work cut out for the old rod, and I laid the pipe down on the rock to have a fair show, for I never could smoke, chaw, spit and handle a fish at the same time.

The bass—for it was a bass—broke water once away off across and down stream and showed his size—a 3-pounder or over if an ounce. Just then the lazy, drowsy feeling left me; my blood was up for a fight of ye olden kind. When he hit the water he started straight for the overhanging willows to my left, and I had the hardest kind of work to pull him away and head him past me up stream. He made a dash and went for a bush top hanging in the water up toward where Tom was fishing, and then the fight became exciting in earnest.

I had on the reel a fine No. 1 Natchaug line that was old and somewhat worn, and as I looked for it to part under the strain at any instant, I made the oft-tried old rod do most of the work. After a tug that made me hold my breath, I held him away from the bush top and he started across the stream and made a wide circuit down near where I struck him, and then I worked him back, a little at a time, till I had him well in hand near the shore in front of me.

Having by this time a little more confidence in the old line, I held the rod up to give him the spring of it, and just let him splurge and surge and cavort around—give and take—till he wore himself out and gave up the fight from sheer exhaustion.

My, what a game fight the old warrior made for his life! I seem to feel even now the electricity running up my arm through an imaginary line and rod, and "warmin' the cockles o' my heart" from the mere memory of it.

When the last flop was out of him I led him to the bank, and stooping over grasped his lower jaw with thumb and finger—I had no landing net—and lifted him out over the bank, "a thing of beauty and a joy for—old Hickory."

I secured him on the stringer, adjusted the big chub on the hook again—the bass had thrown him out up the line a couple of feet or more, uninjured and as lively as ever—and cast out to feel for another one. I lighted the old pipe and sat down on my rock to quiet my nerves with a few whiffs, for during the recent controversy I had become "a leetle mite narveous."

Tom sat on his rock above and fished serenely, in blissful ignorance of the exciting episode just passed. I fished till I got tired of waiting for a bite, and then followed the path through the bushes around a few yards below to another opening in the brush, where I could get to the bank of the stream. Here I fished till the sun slanted in my face, and I got lazy again and reeled slowly in to quit and go to camp and up to the farmhouse for some milk and a loaf of bread that we wanted for supper.

As the little cork neared the end of an old sunken "John boat" lying with one end against the bank, it suddenly went under water out of sight, and I let the reel run till 10 or 12yds. of line went out straight across the stream, as near as I could judge for the milky water, and when it tightened I pulled and thought sure I had struck a log or a mud turtle. A second more and a bass went out of the water away out in the stream that looked to be more than 20in. long, and then began about the craziest performance that I ever witnessed in a fishing experience of nearly fifty years. When he struck the water he started quartering up stream straight for the place where I had left my fish and minnow bucket, and for fully 50ft. or more perhaps he flashed along with the speed of a rocket, as it looked, with his dorsal fin erect and bristling and an inch or more of his back out of water. He seemed to fairly fly, and I swung the rod up, pulled as nearly into an arch as a rod can shape itself, to hold him out of the willow tops drooping in the water along the bank, and the nearer he got to them the harder strain I put on the old rod, forgetting all about the uncertain strength of the little line. When within less than 10ft. of the willows he went under water and turned toward me, as the lessened

strain on the rod indicated, and the next instant he went nearly 3ft. into the air, and shook the hook and big chub out as "clean an' slick as a whistle," right there under my nose, as it were.

"Land o' the settin' sun! was there ever such luck on the face o' this livin' airth?"

It may have been that he was only slightly hooked, and the hook tore out under the strain I was putting on it; anyhow the spring of the rod jerked hook and minnow a dozen feet toward me before they struck the water. The old, old twitter—"the big ones always get away"—that some idiot is ready to poke at you when you lose a big fish, came in my mind, and it didn't improve my ruffled temper any.

I made the argument to myself that a big powerful fish can get away easier than a little weak one. A big bass of 5 or 6lbs. has ten chances of breaking a hook or parting a line to a little one's none; and if he is only slightly hooked the big one may by main strength tear loose from the hook, while a half-pounder would stand no chance whatever of doing the same trick, because not possessed of the strength to do it.

Thus I figured it out to my entire satisfaction why I had lost that big bass, and I was in just the mood to set those down who are forever chaffing one with "the big ones always get away," as a lot of asses, without sense enough to find out why they get away. So I consoled myself in a measure, but I think I was never more keenly disappointed and upset in my life over losing a fish than I was over the loss of that bass; but he had beaten me in fair open warfare, and I had to bear my defeat with the best grace possible. Still it was a case that called for a whole lot of vigorous expressions, mixed with more or less profanity perhaps, but I couldn't call to mind just then any words or adjectives within the scope of the United States language strong enough to relieve my feelings, so I said nothing at all.

I fished a while longer, with a forlorn hope that the old fellow would take a notion for another taste of the yaller chub (that chub had a few scales scraped off, but otherwise was lively and in good condition to stand another episode), but he seemed to have enough for the day at least, and I reeled up, crushed in spirit, and went around where I had left my bucket and my two fish, and taking old yaller carefully off the hook dropped him in the bucket for another cast for the big crazy bass next day. I went up the path to where Tom still sat on his rock, a picture of indolent content, and held up my fish for his inspection. He set his rod, and after critically looking the big one over and "heftin'" him he said, still looking wistfully at the bass, "My, but he's a darlin'! three pounds an' a half shore's yer born! Where'd ye get him, Jeems?" But he didn't chuckle any; that bass seemed to knock all the hilarity out of him, and he looked about as cheerful as a pug dog at a funeral.

It was a sort of even for his laugh at me earlier in the day. When I told him about losing one down by the old boat that would weigh 2lbs. more than the darlin', he brightened up and said cheerily, "All right, Hickory, I'll go down there to-morrow and catch him for you; let's go up to camp and get supper." The sun had dropped below the hill and it was time.

Back at the camp we tied our fish out near the washstand, and I made a trip to the farmhouse, while Tom started a fire and dressed the two catfish and a couple of the smaller bass. We had for supper cats and bass, bacon and eggs, bread and butter, with delicious honey from the Riggles apiary smeared on it, coffee and some other good things that I don't now recall, which moved Tom to remark, as he had said of our bed, "Hickory, it's good enough for a dog."

After supper we rigged up some set lines and tied them to the roots and stakes stuck in the ground along the bank above the ripraps and baited them with dead minnows; these for channel cats, and mayhap a soft-shelled turtle; for channel cats done brown, and soft-shelled turtle done into a savory stew are "pow'ful good eatin'."

We carried up a lot of wood from a drift near by and sat in front of our cheery camp-fire and smoked and talked of the events of the day till well into the night, and turned in when the fire had burned out as contented a pair of "old comrades" (I am more than twice as old as Tom) as ever made a camp together.

KINGFISHER.

[TO BE CONCLUDED.]

Natural History.

East African Mammals.

BY D. G. ELLIOT, F.R.S.E.

(Continued from page 204.)

SWAYNE'S DIK-DIK (*Madoqua swaynei*). NATIVE NAME, *Sakáro Guyu*.

OF the three species of pigmy antelopes inhabiting Somali-land the present is the smallest. It is generally distributed, and we met with it from the coast across the Haud to Ogaden. We have no specimen from that land, where it seems to be supplanted by the two succeeding species, but we did obtain examples a considerable distance south of Toyo Plain, and it is probable that in that direction it extends its range to Ogaden also. It is clearly distinguishable from *M. phillipsi*, the color of its coat being very much lighter and of a different hue. My series is quite large enough to make this fact conspicuously plain, and although the two species are met with frequently in the same localities there can be no doubt I think that they are independent species and not races one of the other. This Dik-Dik is very plentiful, and a larger number would often be seen in one day. It does not go in troops, but usually only the male and female would be found together, sometimes accompanied by a young one. They would bound out of a clump of aloes or from beneath some bush and go rushing away just like rabbits, and it was surprising the speed at which they swept along. They rarely ran in a direct course for any distance, but dodged about among the bushes in the most bewildering way. After running for

a few moments they would stop and intently regard the cause of their alarm, and thus give an opportunity to shoot at them with some chance of success. The female always led the way, the male following a short distance behind. Should a young one be of the party it generally took the lead, and showed fully as great speed as the parents, keeping ahead with apparently no effort. Their slender legs, no larger than pipe stems, move with such rapidity that they become invisible, and it would seem that they could hardly withstand the shocks and hard usage they must receive on the rough, uneven ground their owner delights in. Dik-Dik feed on leaves and shoots of various bushes, and seem to be rather dependant on a supply of water, though where the individuals living to the south of Toyo Plain and similar dry localities procured it, would be difficult to ascertain.

PHILLIP'S DIK-DIK (*Madoqua phillipsi*). NATIVE NAME, *Sakáro Gol Ass*.

Phillip's Dik-Dik is larger than Swayne's, and also very differently colored, its rich rufous, almost at times mahogany flanks, presenting a strong contrast to the dark back and pure white belly. In some individuals this red color intrudes so far upon the white of the under parts as to leave merely a narrow white line in the center of the breast and belly. Placed side by side in a considerable series as that now before me, the strong difference in color between these two small antelopes is very apparent.

A remarkable peculiarity of these little animals is the immense deposit in the antorbital vacuity of a black pigment, which stains everything it touches. It forms a swelling just in front of the eye and from its jet black color and considerable size makes a very conspicuous mark. No trace of this exists in the skin, and as the skull shows a cavity at this point, no one would imagine that there would here be a prominence on the face instead of a depression. The lack of knowledge of such facts as this causes the mounted specimens in museums to appear totally unlike the living animal, more caricatures than the real object, and I have never seen any drawing that correctly represented a Dik-Dik. Waller's gazelle is another species possessing a similar deposit, but of course from the greater size of that species it is on a much larger scale.*

When alarmed these Dik-Dik utter a shrill whistle two or three times repeated, and then bound away in a series of jumps as if they were mounted on springs, flying at times over low bushes, or leaping high in air as if to enable themselves to look back and get a better sight of the intruder on their grounds. Their movements on such occasions reminded me more of the powerful jumps of the mule deer (*Cariacus macrotis*, Say) than of any other animal that I have seen, and in proportion to their respective sizes I think the Dik-Dik could cover more ground in their average leaps. They are very pretty and attractive animals, with a peculiar physiognomy, caused by the black swelling already referred to, and the immense eye, seemingly out of all proportion to the rest of the face. It is an eye that would be naturally associated with a nocturnal animal, and gives the impression that its owner ought to see best in the dark, but I never noticed that these antelopes were ever incommoded during the daytime from lack of ability to see clearly. The iris is a light hazel, which makes the large eye even more conspicuous. Only the males of these species carry horns, about 2.5oin. in length, nearly straight, sharply pointed, and annulated for two-thirds their length. Between and back of the horns is a long crest-like tuft of rufous-colored hair. The figure of this species in Scater and Thomas' "Book of Antelopes" is not nearly richly enough colored. The flanks are too light.

GUENTHER'S DIK-DIK (*Madoqua guentheri*). NATIVE NAME, *Sakáro Gussuli*.

This Dik-Dik, peculiar among species of this genus in Somali-land on account of its lengthened muzzle, is not found so far as my experience goes north of the southern limits of the Haud. We met with it for the first time at Dagahbur, and together with Phillip's Dik-Dik it is found throughout Ogaden. In size it is much larger than either of the preceding species, and has a very differently colored coat, but would without these characteristics be readily distinguished by its long muzzle. It is not nearly so handsome a species as the other Dik-Diks, lacking entirely the strongly contrasting coloring which they possess. It goes in larger troops than either of the other two species, and sometimes as many as a dozen are found together, being in this respect quite different from either Swayne's or Phillip's, of which rarely more than three are started at a time. It may, however, have been possible that as it was the summer months, April to October, when I was in Somali-land, these animals were paired, and that would account for only a male and female being always found alone together. In its general habits Guenther's Dik-Dik does not seem to differ from its allies of the same genus. This species is about one-fourth larger than Phillip's Dik-Dik.

PELZELN'S GAZELLE (*Gazella pelzelni*, KOHL). NATIVE NAME, *Déro*.

This is the gazelle of the lowlands, and is not often seen much beyond Laferug on the road to Hargeisa, where the following species begins to make its appearance. It is the larger animal of the two, and they resemble each other very much in their habits. Pelzel's gazelle frequents dry and stony places, covered with low bushes, and it is difficult to see where or how it can obtain sufficient nourishment from the barren, forbidding districts it inhabits. It goes in small troops of from two or three to nearly a dozen individuals. I think eleven was the greatest number I ever saw together at one time. As a rule it is not a wild creature and readily permits an approach sufficiently near to insure a fatal shot, but of course when much hunted becomes wild and wary. The males were often seen by themselves, and then it was not difficult to stalk them. Their horns are almost straight and annulated nearly to the tips. The female also carries horns, much straighter and much more

* Much additional technical matter as to Phillips' Dik-dik and the other species described will be found in the Proceedings of the Field Columbia Museum.

slender than those of the male. There is considerable variation in the coloring of individuals and I hardly know what causes it. The typical style has a broad conspicuous chestnut band running lengthwise along the body just above the white of the belly. But some individuals, evidently of an equal age, killed practically at the same time and in the same condition of coat, were entirely without this distinguishing mark. It may be possibly an exhibition of individual variation, for these specimens were not confined to any especial locality. I do not think, however, it was in any way an indication of age, for fully adult animals were without the stripe, neither was this peculiarity confined to either sex.

SPEKE'S GAZELLE (*Gazella spekei*). NATIVE NAME, *Dévo*.

This is the gazelle of the high plateau, and first appeared to us at Laferug. The two species seem to meet here, as both were seen in the vicinity of this locality, but Pelzel's gazelle was not found any further to the south, the present species replacing it entirely. Speke's gazelle is smaller than its relative, but can never be confounded with it, as it is easily distinguished by its peculiar wrinkled nose, possessed by both sexes, but greatly modified in the female. It inhabits the same kind of ground as Pelzel's gazelle is found in—stony bare stretches with patches of stunted grass scattered over it—and it is very seldom met with among trees of any size, although I have known it to go into rather dense clumps of jungle. I think, however, on these occasions it sought such retreats as places of refuge and more from necessity than from choice. Both sexes possess horns, those of the females being quite slender and rather straight. The horns of the male are rather stout, deeply ringed almost to the tip, and curved backward at quite a different angle from those of Pelzel's gazelle. It is a shy animal, at times quite wild, and one is obliged to take long shots to secure a specimen. As a rule it seemed as if the males generally led the small bands in the marches about the country they frequented, and I was somewhat surprised at this, for the reverse is generally the case among the deer and antelope. But of course there were instances when I saw the female piloting these bands, the male straggling after her in a very careless sort of way. All the individuals, however, keep a pretty sharp watch, and when anything unusual is seen the whole band stops and regards it intently, for the animals possess a good deal of curiosity and frequently stand and gaze a long time before commencing to run. When first startled they do not go very far, but stop and look back, and if they see nothing will commence to graze again or play with each other, the males indulging in mock battles or chasing one another with a great burst of speed; for they run with much swiftness. If followed persistently for a time they will leave the locality entirely, at least for a short period. This species soon obtained a fair idea of the range of an ordinary rifle, but was deceived by that of the Lee-Metford and Männlichers.

[TO BE CONTINUED.]

White-Throated Sparrows Winter in the North.

NEW YORK, March 9.—*Editor Forest and Stream:* In your issue of March 12 a correspondent who saw a flock of white-throated sparrows in Central Park, New York city, on Feb. 26, inquires whether this is not an early date for the species. The regular wintering of these birds (*Zonotrichia albicollis*) in Central Park is well known to those who observe the wild birds there, and some of them may be found almost any day from early October to the middle of May.

JONATHAN DWIGHT, JR.
[This should have been noted; we have seen the birds wintering not only in New York, but in southern New England.]

Game Bag and Gun.

Old Guns and New.

SAN FRANCISCO.—In a recent number of the FOREST AND STREAM I recollect reading some allusions to old-time guns. As I sat in my easy chair after dinner this evening, smoking my pipe, my mind wandered back to my schoolboy days—or I might say my occasional days in school, when I did not run away and spend the majority of them on the waters of the old Susquehanna in my skiff, fishing, to pay the penalty the next morning with a regularity that became chronic. Fishing was varied by stealing the old single-barreled shotgun from the kitchen closet. How well I remember that old flint-lock gun!

It had a history; originally it belonged to an old farmer, who took it out one day to shoot a marauding skunk, which, although but a few steps away, he missed. Then the skunk got in his work on the old man, who in his rage on missing imprecated the old gun and brought it down over a log, bending it in the shape of a rainbow. My governor happening to be driving past at the moment, stopped to laugh. This increased the old fellow's "mad," and he apostrophized the old gun again, saying: "There! blank you! You never did shoot worth a cuss. Here, Squire, take the old thing out of my sight." And he pitched it into the buggy.

A few days later my father took it to the village blacksmith, an ingenious fellow, and said: "Here, Jones, try your skill and see if you cannot straighten the old gun."

Jones scratched his head and remarked: "What a tremendous charge you must have been shooting in it. But I will see what I can do with it." He worked over the old gun at odd spells for a week, and straightened it out, barring a few wabbles that defied his best efforts. But the result was that ever after it acquired the reputation of being the best shooting gun in the town, for long shots and true ones; and many a wild pigeon we boys brought down with it; and later, when percussion locks came in fashion, it was altered to that style.

But the old gentleman's pride was a double-barreled, flint-lock Manton, which was presented to him for legal services by a broken-down gentleman, a New York sportsman, who had nothing else to give. This I was never allowed to touch.

Those were the days of wild pigeons galore, and they

flew in flocks of thousands right through the single street of our village, low enough down to be reached; and my father was wont to stand in our front yard and knock them over by the dozen, supplying all the neighborhood. When I arrived at man's estate my first purchase was a Westley Richards, the cost of which absorbed the savings of many a month's salary; and thereafter my passion for guns resulted in the collection of those of every well-known maker, embracing a William Moore, Greener, and several others, at a cost of \$250 each, all muzzle loaders, for breech loaders had not then come into fashion. And there they all rest, in brackets, in the attic, and for them the best offer I could ever get was \$10 each. But even now, when I go out shooting where game is not over plenty to demand rapid shooting, I take the William Moore or the Westley Richards, and feel sure of bringing down my birds, for they are wonderful shooters. Again, I like to indulge in the old muzzle-loading style. It carries me back to my boyhood days.

My first purchase of a breech loader was made one day in Paris, when strolling along; in the window of Lafourchaux's gun store I saw one for the first time, and going in, purchased it and brought it home. The first breech loader used pin-fire cartridges. A pin in the cartridge came up through a slot in the breech, and when the hammer struck this the cartridge was ignited. I was very proud of my new gun, and one day after arriving home I started out to try it with a couple of dozen cartridges in my shooting coat pocket. Seeing some wild pigeons on a dry tree, I essayed to stalk them, and in doing so had to crawl over a slippery rock. Just when I essayed to rise to get a shot my feet went out from under me, and down I came, striking on the pocket containing my cartridges. Immediately there was a *feu de joie* equal to a Fourth of July, and a hot sensation. I jerked off my coat, but the pop, pop continued until half the cartridges had exploded, and I dumped the lot out on the rock to find the pocket on fire. Strange to say, the shot had not been started, but the paper had been burst through. This was the case in many experiments I afterward tried with pin cartridges, and I think it is the same with central-fire and rim-fire cartridges when exploded unconfined. I continued to use the gun, however, and never had any similar accident; but I was not proud of the gun as a shooter. Central and rim-fire cartridges soon displaced pin-fires; and now the guns of these days are simply perfection. Whenever I am in London I spend days in wandering around looking at the guns in the windows of the principal makers. They are simply beautiful, especially the small calibers, for ladies, .16, .18 and .20. I always feel as if I would like to wear one of them for a scarf-pin, although their size would be a little inconvenient.

It has always been a great regret and sorrow that my dear old governor could not have lived to enable me to present him with a present-day breech loader, and what he would have prized even more, a split-bamboo, for he was a trout fisherman "from way back." He was the only one in that part of the country who used exclusively the fly, greatly to the wonderment of the old farmers, who would stand open-mouthed to see him toss out trout by the dozen from the then prolific creeks. It was my duty to accompany him, carrying a big basket, of an afternoon's fishing, and my backache gave evidence of the weight before the day ended. Every farmer's boy was not then a fisherman, and the brooks of old Otsego and Delaware counties, in New York, were teeming with the king of fishes. So you may not wonder that the undersigned comes justly by inheritance by all this weakness for breech loaders and split-bamboos. And so, when I hear a man say he neither shoots nor fishes, and does not care for either, I button up my pocket and keep my hands on my watch; but on second thoughts I say to myself: "Poor man, it may not be his fault; he may have had a father equally benighted, who had none of the pleasures of life to leave him."

PODGERS.

Maine and New Brunswick Game.

Editor Forest and Stream:

It is truly refreshing to discover that there is one man permitted to live in Maine who has the courage to tell the truth with regard to the false and misleading statistics that are published from time to time to advertise the game attractions of that State. Your correspondent from Brewer, Me., sheds a flood of light on the method of computation pursued by the railway and express companies:

"A great many of these are counted twice—the saddle counts, and then the head is counted. Also New Brunswick moose are counted which pass this way, and New Brunswick, Nova Scotia and Newfoundland caribou heads which are received for mounting in Bangor all count."

It was a wise man who said: "Figures won't lie, but liars will figure." Your correspondent might have added that some of the finest moose heads ever taken in New Brunswick are now being shown at the Boston Exposition as part of the Maine exhibit.

Maine is a fine country for deer, but the chance for moose and caribou is rapidly approaching the vanishing point. Even according to the annual report for 1897 of the Commissioners of Inland Fisheries and Game, it appears that it took 10,509 sportsmen to kill 250 moose and 239 caribou. In other words, the chances were about 20 to 1 against the sportsman shooting either a moose or a caribou in Maine. When it is considered that fully one-third of these moose and caribou came from Canada, and that, as your Brewer correspondent describes, many of them were counted twice, the odds against the individual shooter might safely be placed at 40 to 1.

Comparisons are odious, but what are the facts in regard to big game in New Brunswick? It is impossible to keep anything approaching a correct record of the number of moose, deer and caribou shot by local hunters in 1897, but a record has been kept of the moose and caribou killed by non-resident sportsmen. Eighty-six non-resident sportsmen took out licenses in New Brunswick last fall. Some of them took very short trips which gave them very little time to hunt. Yet these eighty-six gentlemen took out of the Province (and doubtless they all went into the Maine column) eighty-nine moose, seventy-six caribou and eleven bears. Only

six parties failed to connect with either moose or caribou. Not many deer were shot, because they are not plentiful in that section of the Province where moose and caribou are numerous.

Maine should receive credit for just what belongs to it—a beautiful woodland country well stocked with deer, with tags on the guides, tags on the game, rifles resounding on every hill, and all the forest trails blazed with the mark of the mighty dollar. The commercial spirit is uppermost everywhere, and it only needs to locate brass bands, negro minstrel troupes and merry-go-rounds at all the principal camps in order to make the thing complete. When I want to go into the woods I want to go into the woods—not into a country where people with guns are crouched behind every stump, and where the presence of other hunting or fishing parties is continually in evidence.

As for the moose supply of Maine, it is practically non-existent. Even the Hon. Henry O. Stanley, for many years Commissioner of Inland Fisheries and Game of Maine, is forced to admit this in a recent article in which he states: "But the moose, the most valuable, the most desirable, the most interesting of the big game of our State, are becoming so rapidly depleted in numbers, in consequence of the ever increasing demand for their heads, that their extermination is probable in the very near future unless the strictest guard is put upon them. Indeed, one may say that only the protection already given them has saved them from utter extinction before this time. What few there are are now confined to the eastern part of the State, and Oxford and Franklin counties know them no more."

FRANK H. RISTEEN.

FREDERICTON, March 8.

The Blue Grouse of Alaska.

BY CHARLES HALLOCK.

THE impenetrable jungle of the Alaskan forest, with its windfalls of timber and its profusion of berries and succulent mosses, constitutes an incomparable nursery and cover for its fauna; but it is not a delectable country to hunt over. In "Our New Alaska" I have devoted considerable space to the game of the mountain ranges of the southeastern coast, in the course of which our Admiral Beardslee relates some personal experiences with the ptarmigan, which occupy the lofty barren plateaus above the timber line. But there are other representatives of the Gallinæ which merit the attention of the naturalist and sportsman, inasmuch as the gold miners are too occupied to hunt much or differentiate species. Chief of these are the blue grouse, ruffed grouse and spruce grouse, which are all very abundant in their several habitats, but hard to shoot and difficult to gather when shot by reason of cross-timbers, undergrowth and precipices. The blue grouse is the choicest of these three, and is not unlike the blue grouse of the Rockies; slightly larger than our Dakota sharptails, the hens being of about the same color. The male bird is of a slaty ash hue, and like *phasianellus* carries a large air pouch on his neck, which is red and bare of feathers, a little like a turkey cock's. Along in May and June these male birds sit in the tops of trees and hoot at intervals all day long, but they are more difficult to locate by the sound than the ruffed grouse of New England, which drum on a log, for they often seem a mile off when perhaps they are scarcely 100 yds. away. Writers have hardly mentioned these birds hitherto, because they have not penetrated where they use. It is too tough a job, as will be seen from what follows. A mile through the forests, climbing always, is an all day trip, and not without scratches.

My interest in these birds has been revived at this juncture by the perusal of an old letter in the Hallock, Minnesota, Enterprise, from a resident of Juneau who occasionally takes an outing with the Presbyterian minister as occasion offers; and I dare say your readers will be impressed by it more than by what I might write myself. The trouble with old hunters is that they do not exploit the hardships of an outing as the more unsophisticated are apt to do, so that personal heroism does not play the active part it should in the narrative. But I will let my correspondent speak for himself. His name is H. Beer, and he says:

"I go out about once a week in the season and we have good sport, and what is better we keep in good health by having lots of good exercise. Often we get up at 3 o'clock in the morning. It depends on the tide as to what time to start, and I have started at midnight. [In that latitude it is as light as dawn at midnight in June.] Sometimes you must go over certain shallow bars at high tide, or you cannot go at all. We sail or row a few miles and then go ashore where we know the birds are to be heard.

"As soon as it is day we hear far up the mountain side the hoot, hoot, hoot of the grouse. Then away we start for some of the hardest and most vexatious work I ever did. The birds are certain to be at least 2,000 ft. high; they keep in the upper fringe of the trees just below the snow line. Well, we climb and climb, over moss and fallen logs and loose stones and sharp crags, and most disagreeable of all through devil club. The devil club is very well named; it is a bush that grows 6 ft. or 8 ft. high and is studded thick with thorns from top to bottom. The branches also run along the ground for a foot or two before they turn, so that as you struggle through it it is very apt to give you a slap in the face, and you are almost certain to get it in your hands unless you wear gloves. We still occasionally hear our bird hooting away above us, so we fight our way on and on, and up and up, the perspiration oozing from every single pore. At times we are in peril, a single misstep may send us headlong hundreds of feet down, and leave us at the bottom a bruised and mangled corpse. After climbing quite a distance it may be you find yourself where you cannot get any higher, and you have to retrace your steps and find another way. Presently, after two or three hours of the hardest kind of work, you find yourself breathless and exhausted at the clump where the sound tells you the bird must be. Your troubles have now commenced. It may be that the bird will cease to hoot, and all your climb has been in vain, so far as that bird is concerned. They stand perfectly still and it is impossible to find them unless they hoot. Then again

they seem to be ventriloquists, one hoot seems to be in front of you, another behind you, another to the right and another to the left. I have spent an hour trying to find the bird in the tree after I have located him. At last, when your neck aches from looking so long up into the tree tops, you spy the rascal sitting like a log a hundred feet up in the tree and so hidden that only a part of his body is visible. Ah, now comes an anxious moment. You have had so much work to find your bird that you do not wish to miss him, so you take good careful aim and fire, and perhaps away goes your bird. He was so high up and so hidden that no shot had touched the fatal spot. It was pitiful to see the look on my companion's face when such a fate befell us, as it did more than once.

"But we will suppose that we have been more fortunate this time and the bird falls. Then perhaps the tree stood on the edge of the cliff, and down your bird goes hundreds of feet and there is half an hour's climb to recover him. You can generally find him by the trail of feathers he leaves behind him. I leave you to imagine the feelings of satisfaction when at last you feel the plump fellow in your hand, and, oh! what a satisfaction it is to drop him in your bag.

"It is now not so hard to get your next bird; you are up where he is, and in ten or fifteen minutes you are at his tree and with good luck may have him in the bag in ten minutes more. But grouse hunting is all work, hard and dangerous work, and a very small bag is considered a good day's hunting.

"After we got through with the grouse we went after ptarmigan. This is another of the grouse family, in size about half way between a pigeon and a prairie chicken. He turns white in winter and brown in summer. He is very pretty and looks like a little bantam rooster with his head and tail up, and a hollow with the tips of his wings stuck down nearly to the ground. He lives up in the snow, and never comes as low as the trees.

"Of course there is the labor and danger of the climb to get him, as in the case of the grouse, but he is not hard to find, and is so unsophisticated that you can easily get near enough to shoot. In fact at times he is so tame that he may be killed with a stick, and is called the fool bird. We only got five for a day's hunting, but in the fall some have got eighty or a hundred. Tuesday we shot four bald-headed eagles, and to-day we have been fishing and got two small strings of salmon trout. A man brought in a hundred, but we cannot spare the time to go so far and stay away so long. We have to be home, so our bags are small, but we enjoy the outing very much. This place is the hunter's paradise. There are deer, bears and goats, but the largest quadruped I have shot is a porcupine."

Incidents of a Fox Hunt.

ONE day in February I drove across the bay to Curtain Island, seven and a half miles distant, to try the foxes there and on the marshes, where during the past forty years I have spent some of my happiest days in the pursuit of game. On my arrival there snow was falling fast, and the wind rose; still I was after foxes, and must at least look for signs at the lee side of the island. This I did, and in a few minutes detected the trail of a fox leading up wind in the direction of a neighboring island. The storm by this time had increased, so deciding to retrace my steps, I had barely turned when I observed a fox coming down wind at a lively gallop, lumbermen having started him. I dropped to position behind a tree; the fox came on, and when he was at about 40yds. I fired a shot; but he still ran on, and thinking he was fatally wounded I followed in hot pursuit, but soon lost his tracks in the blinding storm and abandoned the chase. Then, intending to resume the search the following day, I returned home feeling vexed with myself for not making a better shot.

The storm, however, continued for another day, making the roads almost impassable; so I deferred the trip till the following week. But my mind reached out thither. I wanted to recover the fox, and mentally was offering a dollar "just to know" where the cunning fellow had hidden. This to me would be ample reward.

On the following Saturday the wind veered to the west, and blowing a gale, sent the snow, which had recently fallen, into innumerable banks, leaving the ice bare between them. Going to the "spy window" in the gable of the barn, I scanned the shore and marsh critically, and among the many objects revealed, such as pieces of driftwood and bunches of decayed grass and seaweed, there lay the fox on a patch of blue ice on the marsh, stretched at full length with head to the east. I then called Arthur, and to test his sight handed him the glass; and although he discovered several objects, still he did not locate the fox until I had given him the exact direction. Considering the distance—seven and a half miles—and the glass being a common one, costing only \$6, the discovery was something remarkable.

The traveling being heavy and the day far spent, I decided that the fox would be safe till Monday. However, to my surprise, on Sunday night another storm began, and continued with unabated fury till the following Tuesday, thus again covering the fox. The case now looked critical, and called for prompt and speedy action. Lumbermen pass over and in the vicinity of the marsh almost daily; "sports" also go there occasionally; then, too, the pelt of this particular fox had greatly enhanced in value. From \$2, the outside market value, I had it up to \$5, and couldn't stand the strain much longer.

On Wednesday afternoon I started for the island and arrived there in two hours. Leaving the horse in comfortable quarters, I at once took my bearings, and proceeding down the marsh, had gone only a short distance when, to my utter dismay, the footprints of pedestrians were painfully visible, leading in the direction where I had originally located the fox. This was rather discouraging, and partially losing my temper I soliloquized: "The fox is a goner. Yes, those vagrants have stolen him—mean, contemptible sneaks; I'd give something to know them; they'll fabricate a plausible story and exhibit the trophy as a result of their own skill." However, following their tracks to a point where the fox should be lying, I took a survey of the surroundings, and Great Caesar! there, within 8ft. of where I stood,

was the tip of an ear protruding through the snow. Never was a fox more highly prized than when I pulled him out of the snow. Those were happy moments, and I breathed calmly. But reflecting on the past—of my willful and malicious charges, which may have been against good and honest toilers who, to shorten their journey, had passed that way—not to steal foxes, but to pursue their honest calling—I felt an apology was due; but to whom I could not say. Then I said: "Forgive me." I was entitled to the trophy, and now possess it; and as I gaze with admiration on the beautiful skin before me, measuring 58in. from tip to tip, I say: "Poor Reynard! You served your day and lost your life; be at rest!"

PRINCE EDWARD'S ISLAND.

Maine Game Conditions.

Editor Forest and Stream:

Your correspondent Special takes issue with my statement that very little illegal killing is being done in Maine, and speaks of deer being offered for sale in Boston which he claims to know come from Maine. He fails to show any proof except his own belief. If he really saw deer being carted from a schooner, and is interested to prevent illegal shipment, why could he not spend the time to get the name of the schooner, so that our Commissioners could have some proof, and stop such shipments? It would not have taken so long as to write an article. I do not claim that there is no illegal killing, but I do claim that there is much less than many newspapers report. I believe that the Commissioners and wardens know fully as much about Maine matters as a man in Boston who has talked with a man "from Maine woods, where the snow is 5ft. deep on a level."

One who knew anything about deer would know that visiting logging roads to pick up hay is no sign of a "struggle for existence." Where deer are not hunted they will always visit the roads, even when the snow is only a few inches deep, to pick up the scattered hay, and will often barely get out of the roads to let the teams pass. I have known hunters to kill more deer by walking up and down the roads than they could by still-hunting.

The facts are, the snow is deep—from 5 to 8ft. in many localities. In some places deer have been having hard work to travel around. In all the lower part of the State the crust has been so hard that not only deer could walk on it, but heavily loaded teams could haul full loads on the crust without breaking it. This was done here this week. Over a large part of the State a deer could only be taken by chasing with dogs in the middle of the day.

Some people have written stories of the great slaughter of the game; and papers like the Lewiston Journal have printed them, and people who know little of game have believed them; but this does not make it so. The plain truth is, the thing has been greatly exaggerated. Next summer you will see accounts of deer being counted by the score, just as you did last year.

Special wonders why I speak of Washington county. Here is a report from a warden in the Bangor Commercial of March 10:

"Game Warden French returned Saturday afternoon from a snowshoe tramp in the game regions of Washington county. He visited Danforth, Forest, Waite, Topsfield, and went up the east branch of the St. Croix, but found only a few signs where deer had been killed, in Dyer township, and even these were old. While in Waite township Warden French saw a big bull moose come out of the woods into a farm yard and hang around all day, evidently knowing that it was perfectly safe while the warden remained. Warden French says the crust will easily hold a deer, and even the moose referred to had little difficulty in making his way over it."

Perhaps the warden does not know the situation as well as Special. I also inclose the reply of Mr. Carleton to a long, blood-curdling account of the great slaughter, where names and dates were given. He writes: "I wish to say that there is very slight foundation, if any at all, for the statements contained in that article. I have received this week so far 131 letters from every section of the State, by far the greater number from guides. From among this very large number I select a sample; which is fairly representative of them all. The writer is a well-known guide, a gentleman of ability and character, and an observing and respected citizen, and lives in a town in the near vicinity of Kingman, where Major Lowe, the guide, resides, who knows so much for the papers alone about poaching:

MARCH 5.—Mr. L. T. Carleton, Augusta, Me.—Dear Sir: Your favor of the 2d duly received and contents noted. In regard to our big game, they need the protection of everyone who is interested in the affair, and it should interest every man in this State, whether he is a hunter or guide, or whatever occupation he follows. I can truly say that the majority of hunters and guides in this town are beginning to understand that fact, and where ten deer were slaughtered on the crust or deep snows a few years ago, very few are killed now—in fact, I do not know of a single deer that has been killed this winter in close time by any man in this town. Five years ago there were, I should say, fifty deer killed in close time by men that would not be hired to do such a thing now. I am acquainted with every man for miles around here, and I know that there is as little poaching done in this town as any town you can find that has as many hunters as we have, and I for one will do all I can to help protect our game at all times, both in open season and in close time. The crust is so strong now since we had the big hailstorm that it will hold a man to walk through the woods without snowshoes—in fact, it will almost hold a team of horses where the growth is open—so the deer are pretty safe until we have some warm weather. I was talking with one of our guides last night, and he said that if we could have the privilege of using dogs in October he would be willing to help stop killing game in close time, but as it is now he should not trouble himself much about protection, but this is only one man out of many that are of that disposition.

"I received under date of March 7 a letter from a very estimable gentleman whom I happen to know, a member of the G. A. R. from Molunkus, one of the places in which this Lewiston correspondent portrays deer being slaughtered by scores. He and his son keep a sporting house, and say they employ five guides; and if there was any indication of poaching they would know it, for they are doing all they can to protect the game."

Perhaps Mr. Carleton, after receiving 131 letters, does not know as much as Special. I leave this for your readers to judge. As for myself, I do not usually rush into print unless I can back up my statements.

M. HARDY.

BOSTON, March 14.—It has been decided that no requisition will be asked to bring the boy moose shooters back to Maine for trial, and in that respect Commissioner Carleton has been victorious over those who desired to see the law enforced equally for all. Under date of March 2 the Maine Fish and Game Commissioners have issued another appeal to the registered guides to do all in their power to protect the game during the present deep snows. They have sent out 1,000 letters this time. The form of the letter sets forth that the worst is to come, for as soon as the crusts form the hunters can easily get over the snow, while the moose, caribou and deer will be more helpless than before, since it requires a crust unusually strong to support the sharp-footed game. The circular winds up with a most urgent appeal: "Now let us all work together as we have never worked before. You know the Commissioners have not funds to hire sufficient wardens. Promptly let us know of any poaching—confidentially if you wish. Let us make a long pull, a strong pull, and a pull together. Are you with us for the work?"

I am satisfied that the appeal is no stronger than the case actually requires. It is a shame the way the deer are coming into the Boston markets—the worst of any season since the law forbidding their shipment out of Maine was passed. In addition to the venison here that I have already told the FOREST AND STREAM about, I saw boxes Saturday said to contain the saddles of eighteen deer. One box had been opened and five saddles sold. They brought 8 and 9 cents per pound. "Poor and thin, all hair and bones," in the words of the salesman who showed them to me. "It is a shame to kill them. They come to us without name. There is no marking on the boxes. Nobody knows what is in them till we open them." The worst feature is that these boxes come by rail, though none of the railroads north or east of Boston would have forwarded them had their contents been known. The reader must remember that the people who receive these deer are commission merchants, receiving consignments of poultry, mutton and veal every day, to be sold on commission. They do not buy outright.

SPECIAL.

Under date of March 5 Commissioner Carleton reports of the game situation:

"As everybody knows, we have an unprecedented depth of snow. It is reported by wardens in Franklin county to be 7ft. deep, in Somerset, Piscataquis, Penobscot and Aroostook counties to be 6ft. deep, and in other counties to be from 4 to 6ft. deep. This great depth of snow now places the big game entirely at the mercy of whoever is wicked enough to go after it and butcher it. Storm has followed storm in such quick succession as to cover up the tracks of poachers, making it extremely difficult for our wardens to trace out the guilty parties.

"The reports from wardens and others in Franklin county and in Oxford county would indicate but very little, if any, poaching.

"Reports from the four wardens on the whole Canadian border indicate no illegal killing. From the vicinity of Greenville it would seem that there has been considerable poaching; the same may be said of Somerset, Hancock and Washington counties and southern Aroostook."

The Long Island Deer Situation.

SAYVILLE, N. Y.—*Editor Forest and Stream:* In regard to the bill before the Legislature at Albany, prohibiting the hounding of the deer for five years, I have to say that this act will provoke the ire not only of the sportsman, but also of the farmer. It is proven enough that the deer in their present limited habitat, north of the South Side country road from Islip to Bayport, and southwest of the Lake Ronkonkoma toward Central Islip, are very numerous. To narrow in the shooting of the deer in the open season to still hunting will have a bad effect, amounts to nothing, and cannot satisfy real sport. The consequences of extending the protection of the deer will be their enormous multiplying, and in expanding their habitat to places where the game has seldom been seen. The depredations on all kinds of truck are fearful, and drive the small farmer who especially suffers to madness and despondency. Ask, for instance, the people of Bohemianville how they have to suffer despite all precautions by putting up of scarecrows, hanging out lanterns, etc., to keep off the deer. Already three or four farms west from Bohemianville are abandoned on account of the unequal fight. In fact, in making such a tremendously onerous game law the State as it were expropriates the farmer without giving him any compensation; the State takes the food out of the toiler's mouth and gives it to the deer. It is hard to understand how the State may enact such a game law in view of the rapidly increasing population of Suffolk county, who have the first claim to be fed.

Think of the anomaly of keeping and expanding a game park (with no fences, the deer running at large) in a district no more than about thirty miles distant from the gates of Greater New York! Instead of encouraging the planting and growing of vegetables to supply the poor with cheap home products, the State forgets its duty and goes to breeding wild animals.

The writer tried before the Board of Supervisors at Riverhead to get some compensation for his losses by the deer. In reply the board said there is in the game law as it stands now no provision to make good to the tiller of the soil the loss he has sustained by the depredations of the deer. Upon questioning, what would the truckers around Mattituck do, seeing their cabbage and cauliflower eaten up by the game, the board answered: "Oh, they should start a revolution." Is that equal right? On the southwest of Riverhead it is expected that the farmer will gracefully succumb to the visits of the deer, whereas it is feared that east of Riverhead this calamity might start a revolutionary disturbance. Justice therefore demands a provision to compensate the small farmer, for he especially has to suffer because the game prefers to prey on small clearings, ready to jump again into the bushes when it scents danger; it seldom enters large stretches of cultivated land. Out of thirty-six young fruit trees in an orchard nineteen were found gnawed off or the stems rubbed off with the horns.

A certain Commissioner of the Commission for Game

and Fisheries some years ago held the opinion that the farmer is justified—notwithstanding the game law—to kill the deer when he finds them depredating his crops; but the present incumbent of the office does not adhere to that reasonable argument.

The Long Island Railroad Co. and all available forces are in combine to build up the country, and it does not demand a very keen prophet to predict that the time cannot be far off when the deer will shy at the presence of man and retire to the thicket.

Why, then, in view of the time near at hand when the deer will inevitably be doomed, owing to the circumstance that the present law already hurts so fearfully the farmer, will a certain clique be allowed to propose such a rigorous game law to the detriment of their neighbors? Let the law alone as it stands at present.

CARL MUNKELWITZ.

CHICAGO AND THE WEST.

California Quail.

CHICAGO, Ill., Feb. 26.—Mr. L. J. Marks, of Chicago, who is spending a part of the winter at Coronado Beach, Cal., writes informally in regard to the wonderful numbers of quail which still exist in parts of that far Southwestern country, which have not yet been depleted by the market hunter or the seeker for a record. He says: "Coronado boasts with good reason of her ideal location, well nigh perfect climate, and superbly appointed mammoth hostelry; and now she comes to the front with a good claim to the somewhat hackneyed title of 'a veritable paradise for sportsmen.'"

"In witness whereof, Messrs. Dupee, Lester and Turner, of Chicago, who are wintering here, brought in, as the result of a three days' shoot across the line in Lower California, only a few hours distant from this hotel, between 800 and 1,000 quail. 'Life was too short,' they said, for an exact count, so after counting up to 800 they quit and threw in a bushel or so for good measure. The birds were exhibited last evening on the floor of the great lounging room of the Coronado, and they naturally attracted much attention. There appeared to be four or five bushels of them, and the lucky, sun-browned hunters were the recipients of many congratulations.

"Bill Denton, a noted hunter hereabouts, acted as guide and purveyor, and had arranged a very comfortable camp for the party near Carisso. Most of the shooting was done in two days, on account of a drizzly rain which fell almost continuously the second day out. But one dog was used, a very indifferent red Irish setter, whose sole business it was to retrieve the birds, the hunters themselves flushing the game, which sometimes got up in flocks like blackbirds, numbering anywhere from a hundred to a thousand. On account of their surprising swiftness in running, a great number of wounded birds were unfortunately lost. In order to get a bird in bag it must be either killed outright or have at least one leg and one wing broken.

"The party contemplates another trip soon, with two or three good dogs, well able to retrieve the winged and slightly wounded, so that another record may be anticipated in the near future. Lest any should be disposed to condemn such wholesale killing, it may be said that the birds are in such countless numbers, and so little hunted, in the region visited that they are esteemed a pest by the few settlers there; and it must be remembered, too, that the bag above referred to would furnish about one quail for each of the guests now sheltered under the roof of the great hotel."

Draining of Tolleston Marsh.

CHICAGO, Ill., March 12.—It is reported from Indiana that the Supreme Court of that State has instructed for the letting of the contracts on the big drain known as the Jarneke ditch, which would pass across the famous Tolleston marsh, and drain it quite dry in the course of a few years. The ditch would carry the water into the Grand Calumet River. The Tolleston Club has been fighting this case. It is not the policy of this club to give out much talk about its plans, and it never pays attention to mere daily newspaper talk. I have earlier stated that the eventual decision of the Tolleston litigation will rest with the Supreme Court of the United States, to which appeal has been taken. It is possible that the club will find legal measures to stay the ditching machine until after the high tribunal of the land has said they cannot own what the United States have patented to them. There is at present current in the daily press the usual review of fatalities on and around this marsh. The local feeling against this quiet and conservative body of sportsmen has always been intense, and stories of all sorts are started about the club. We may safely say that when we see the Tolleston marsh dry it will be time enough to say it has been drained, and not before.

Later.—President E. F. Daniels, of the Tolleston Club, has been interviewed, and brands the published information as inaccurate, as usual. He says the proposed ditch will not touch the club grounds at all. What the club objects to is an assessment of \$15,000 on its land to help pay for a work that will be of no benefit whatever to the club.

North Dakota Wardenship.

The question of the State game wardenship for North Dakota for the new term is not yet decided. The present incumbent, Mr. George H. Bowers, has done good work and shown himself entirely worthy of reappointment. He is very apt to get the office, as he is a popular man, and his work has been generally appreciated. Other applicants for the place are C. K. Bassett, an editor, of Valley City, and Clarence A. Hale, of Grand Forks.

Arrests in Montana.

James Bussear was arrested at Gardiner, Mont., near the Park line, last week. Bussear had been killing elk. He was taken to Livingston and tried before Justice Rose, who bound him over to appear before the District Court next term.

It would seem that finally a partial check at least is to be given the elk butchers who have been operating this winter along the upper Sun River. Constable Zim-

mers, of Augusta, last week brought into Helena for confinement Joseph Chase and Charles Dando, who were arrested by Deputy Christian and posse at their camp, where full proof was discovered of the fact that they had been doing a wholesale business in skin hunting. Justice Meyer at Augusta bound these two men over to the District Court. There has been a great deal of this wholesale slaughter in the Sun River country. Warrants are out for two prominent citizens—W. K. Flowerree, State Senator from Teton county, and Dr. Winslow, Superintendent of the Fort Shaw Indian School. They, it is alleged, were up in that country after Jan. 1, and brought out a four-horse load of elk and mountain sheep. Evidence is at hand for other parties, and warrants will probably be issued.

Mongolian Pheasants in Texas.

Messrs. Albert and Ed Steves and Gus Critzer, of San Antonio, Tex., have for two or three years been the owners of a small supply of mongolian pheasants, which they imported at considerable expense. The birds have done fairly well, and their owners this week were to have turned twenty-five of them loose in the mountains some sixty miles northwest of San Antonio. The birds will be liberated in a spot some twenty or thirty miles distant from any settlement, and in a country where they ought to thrive. At New Braunfels, Tex., the city marshal has been for some time experimenting with these birds, and he will soon set loose fifteen of them in Comal county, about thirty miles northeast of San Antonio. The Texans confidently expect that this stock will do as much for itself as did the fifteen birds originally planted in the State of Oregon by Judge Denny.

The Spring Flight.

The north-bound ducks are now well up in the North. I hear of increasingly good bags on the Platte River in Nebraska. The flight along the Missouri River is reported good. At Mud Lake, near St. Joseph, Mo., Pat Kane, chief of the fire department, with two friends killed 128 ducks one day last week. Along the Illinois River the birds have come in in good numbers, especially around Browning and points in the lower part of the State. The shooters say that the birds are not feeding along the river, but going out over the country, the mallards feeding on the old corn fields. Along the Kankakee River in Indiana the shooting has been heavy on a few occasions, at water holes in the ice, where the birds circled and tried to get into the water.

A Good Thing.

Dispatches this week from Ohio say that the State Legislature has passed a law giving wardens the right to open packages of illegal game offered for transportation, and to confiscate same, giving all such game when found to charitable institutions. This latter part of the measure is certainly unqualifiedly good. There never was a more risky clause put in a game law than that allowing a warden a part of the money he can get out of confiscated game. Witness the many instances of abuse in this State in earlier years, for instance the Kewanee fiasco, where no attempt was made to fine the man Merritt for a crime, the energies of the warden and his assistants being confined to attempts to get at the great amount of game, which could be sold under the Illinois law at auction, the warden keeping half the funds so acquired. It is of no practical use to take away game from a dealer who holds it illegally and then put it up at auction and let that dealer buy it in and get a legal title to illegal game. This leaves one of the fatal loopholes which vitiate so many laws. I presume the original purpose in such statutes was to provide some means by which the game warden might be able to create a revenue for himself by his own exertions. There is no doubt that the sale of confiscated game is a very considerable source of revenue in this State, for Warden Loveday has often told me so. Yet I imagine that he would just as leave turn this contraband game over to the homes of the friendless as to sell it over again to dealers, provided that he himself were paid as much from some other source as he could get from this odd marketing of game declared illegal by the law and yet sanctioned by the law. The man who handles illegal game is just as much a criminal as a burglar. When we catch a burglar we do not try to punish him, or to pay ourselves for catching him, by a division of the plunder he has stolen. We clap the criminal in jail and give the property back to the owner. Clap the illicit game dealer in jail too, and give the game back to its owner, the State, which has to feed the inmates supported by its charity. If this isn't good sense, I am off my trolley.

Cipher Correspondence.

I have at hand a letter handed me by Warden Loveday, which letter was written by one purporting to be F. T. Hart, of Cainsville, Mo., to E. A. Gaensslen, a commission merchant of this city. The letter is so badly written that it might classify as a cipher dispatch, and it may be that the writer wishes it had been still more illegible and undecipherable. It goes on to say: "Jenuary the 28 mr. ganslen i hav Bin sicK for fower weeks SinCe i saw your sent. i am gittin game rite now i have som e gaw i will sent them in now mr i will do business with you i will sent you som eggs. how long can you Handel Birds privetly mr send priCes onCe a weak is anuf."

This is the way the game comes, "privetly," sometimes. Inclosed with the letter was a shipping tag marked "Birds 78, mink 1." It is a bit rude of Warden Loveday to thus make public a gentleman's private correspondence, when it has such obvious need of being conducted "privetly."

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

Messrs. Schoverling, Daly & Gales' Removal.

ON or about April 10 Messrs. Schoverling, Daly & Gales will remove to No. 325 Broadway for a temporary occupancy until the completion of the new store which is to be built for them at Nos. 302 and 304 Broadway.

St. Louis Notes.

ST. LOUIS, Mo., March 12.—There is probably no better game and fish preserve in the United States than is comprised in what is known as the "Sunk Lands" of southeast Missouri and northeast Arkansas. This region is heavily timbered, full of lakes and streams, and a vast portion of it is subject to annual overflow, so that the whole region is kept well watered. Through this region flow the Little and St. Francis rivers, which the United States Fish Commissioner's report states contain a greater variety of fish life than any other river system in the country.

This section has been the paradise of the market hunter and fisherman, and a large portion of the supplies which come to the large cities along the river have been from this region. Arkansas has a game law prohibiting shipments out of that State of any game or fish, but it has not been closely enforced. Recently, however, instructions have been given by the State officers asking county officials everywhere to be on the watch and to prevent any shipment of game or fish out of the State. While this has been aimed, no doubt, at the visiting sportsmen from other States, it will prove a mighty good thing if the officers will stop the market shipments of the native hunter as well.

The club which has long been known as the Moredock Lake Hunting and Fishing Club will now locate on the Castor River in southeast Missouri, and hope to have a game warden appointed in that section who will co-operate with the warden at New Madrid and prevent illegal netting. The famous Moredock Lake, lying south-east of St. Louis about twenty-one miles in Illinois, has again been leased by a new club, and we understand the club has the consent of the surrounding farmers to dam up the outlet of the lake, which will make it again famous as one of the best fishing resorts in this section of the country. The drainage law of Illinois has been the means of destroying many excellent fishing preserves without any corresponding benefit in the way of reclaimed lands.

The game commission houses and restaurants, and others interested in the preserving of game by the cold storage process, will have a meeting to devise a law for the better protection of the game of this State. We all know what kind of a law these gentlemen desire, and it is to be regretted that the genuine sportsmen do not have the same influence in legislation as do these violators of the game laws of the States. It is to be hoped that some steps will be taken to defeat the purposes of these commission men.

Although it has been a very open and mild winter, our fish market has had very few fresh run fish, but the supply has been mostly from cold storage refrigerators. Whether the enforcement of the game laws has had anything to do with the scarcity of fresh fish is undetermined; but certain it is, however, that the new game warden of this State has made many convictions in the southeast part of Missouri, where the market fishing is carried on.

The King's Lake Club have had their share of troubles, and as is frequently the case the former keeper has purchased some adjoining property, and is doing what he can to take away members from the old concern. This lake has of recent years been of little account for fishing purposes, but duck shooting has been fairly good during the season. At present ducks are quite abundant along the river and fine shooting is reported from the preserves up the river, and also on the Illinois side, in the sloughs. There are few ducks, however, to be seen in the market. It has been a very easy winter on quail, there having been but little snow, and the thermometer not once dropping to the zero point in this section of the country. The birds have come through the winter in excellent condition, and there should be a great increase in the supply. ABERDEEN.

Enemies of Grouse.

I WAS glad to see Mr. Stark's article on foxes and grouse. Experiences differ somewhat. As I never use a dog for any kind of game, I have killed but few foxes; but I have several times seen where they had caught them while under the snow. I have also seen a fox with a rabbit in his mouth. I have known a fox with a fore-leg broken by a shot that day to kill and bury a rabbit. I once surprised a female fox in June which had a large woodchuck in her mouth, which she was carrying to her young. The woodchuck also was a female, and was nursing young.

While foxes kill more or less partridges and rabbits, they do not kill nearly as many as wildcats. I have known a single wildcat to destroy entirely all the rabbits in a large swamp in one winter. In December the rabbits were very plenty, and in a late snow in April not a single track could be found; but I saw a good many places where rabbits had been eaten. I also in the winter saw where he had crept to and killed a grouse.

In this vicinity we have never had any snaring, and very little market hunting. A few grouse are sold, but it is very rarely any one tries to hunt for the sake of any profit; but the grouse have steadily decreased, and we cannot have one-fourth here of what Mr. Stark reports. Horned and barred owls used to destroy a great many. Contrary to the common belief, both hunt in the daytime as well as in the night, and I have seen both with grouse they had just killed in broad daylight. As the larger growth has been cut off, the owls have grown more scarce, but the grouse have an enemy left worse than both owls and foxes. The goshawks stay here all the year round. They nest here, and a pair of them will kill a large part of the game in several miles square in a year, besides killing many domestic fowl and rabbits. Besides killing to eat they sometimes wantonly destroy for the fun of killing, just as city sportsmen often do. One of my men in going to camp one night in winter saw seven grouse budding. In going to his work in the morning he found the remains of five lying on the snow, and saw the hawk which had killed them. They will very quickly run a grouse down on the wing. I have seen one doing this. I think that the larger part of the grouse which they get they take on the wing. Mr. Stark speaks of foxes usually being fat. I had a goshawk brought to me last week which was on the

back nearly as fat as a goose. I have skinned a good many, and never saw a poor one. I think that in the towns near here the goshawks get nearly half of what the gunners leave, before spring; but still the fact remains that in old times the grouse held their own against all their wild enemies. It is the over-gunning which has so disturbed nature's balance. The one great trouble is not altogether the number who gun, but their using dogs. If no one would use a dog, the grouse are so shy here that very few would be killed, and in time they would increase; but as it is, they seem doomed soon to be surely exterminated in this vicinity.

M. HARDY.

Duck Shooting at Currituck.

COINJOCK, Currituck County, N. C., March 10.—On Tuesday of this week, March 8, just as the sun came up out of the Atlantic, peeping through a gray mist, I looked up from my sink box and immediately crouched down as low as possible, for there were eleven plump, fat, ruddy ducks heading exactly for my box. There were five reports, and six ducks lay dead on the water. I only had time to load one gun when another flock came from the same direction, and two responded to the discharge of each load of No. 5s. It was a new way to hunt them, and I was so much pleased with the bag made I hasten to give it to all readers of the FOREST AND STREAM, that they may profit by my experience. I simply place my sink box as near in the line of flight as possible, using no decoys at all. The wind was blowing from the east and the ducks flying north, so that almost every bunch gave me a side shot. It was fine sport, and our bag was a good one. The same day our neighbor, P. Ballance, who is perhaps the best shot in this section, killed 165, bagging 100 in one hour, having fired only 116 shots. The shooting at Currituck has been as good this season as it has been any time during the past ten years, and game of all kinds is still abundant. Our season closes April 1 for ducks, geese and swan, but we have excellent bay bird shooting during April and May and again in July, August, September and October; in fact, we have good shooting at game in season eleven months in the year. I believe there is no other place on this continent where this is the case.

CURRITUCK.

Game Destroyers Numerous.

DR. B. H. WARREN, of the Pennsylvania Game Commission, in his annual report brings out one or two points which will surprise sportsmen and which will make clear to all why game birds have been decreasing so rapidly in some sections of the State. Dr. Warren shows that there are 42,000 foxes, 30,000 minks, 13,000 weasels and 300 wildcats in the State, all of which are great game destroyers.—*Commonwealth*. This all reads very smoothly in a report, but it does not cover the ground. How can Dr. Warren explain the abundance of game birds of all kinds in Pennsylvania when, unhampered and in great numbers, wild animals roamed the forest wilds of this commonwealth? The insignificant outfit of foxes, weasels and minks that yet remain are not the dangerous enemies of game birds. It is the ruthless slaughter by would-be sportsmen and the unrelenting warfare waged by the pot-hunter that is rapidly exterminating game birds in the Keystone State.—*Mechanicsburg, Pa., Daily*.

Bears in the Catskills.

COMMENTING on our recent remark that "if a few years ago any one had predicted that the time would come in the Yellowstone Park when the bears would make a practice of coming up to the hotels to be fed, he would have been laughed at for a lunatic, yet at the present time this is seen daily during the season by crowds of astonished tourists." Mr. Charles Hallock writes: "When I was at the Catskills in 1894, Rush and I used to take the tenderfoots bear hunting out to the swill pile a mile back of the Kaaterskill Hotel. We never failed to find game; coons, too."

Shooting at Chincoteague.

CHINCOTEAGUE, Va., March 12.—Geese are very plenty in Chincoteague Bay, with a good prospect of brant, shell duck and other species for the next two weeks, as these birds are now passing up from their Southern wintering grounds toward the North. T. G. ELLIOTT.

New York Game Law Bill.

IN the following paragraphs are noted the important amendments proposed in the Senate and Assembly to date this session: Sec. 34. To empower any person to seize and destroy unlawful nets; and to provide a bounty for their destruction. Sec. 40. To make open season for deer Oct. 1 to Oct. 31, inclusive. Sec. 41. To make season for possession Oct. 1 to Nov. 5. Sec. 42. To forbid killing does at any time. Sec. 44. To permit hounding during October. Sec. 40. To make open season for deer Sept. 20 to Oct. 20; to forbid killing in the water; to limit a person to one deer in a season. Sec. 41. To make season for sale of venison Sept. 20 to Oct. 31; and to prohibit sale of venison killed within the States. Sec. 44. To permit hounding from Sept. 20 to Oct. 20. Sec. 46. To limit transportation to one deer accompanied by owner. Sec. 41. To make season for possession of venison Aug. 15 to Nov. 20. Sec. 48. To permit possession of moose, elk, caribou and antelope for breeding purposes; also sale of the meat during season for possession of venison. Sec. 49. To remove protection from rabbits altogether; and to make open season for black and gray squirrels Sept. 1 to Dec. 15. Sec. 51. A new section to forbid killing deer in Ulster, Greene, Delaware and Sullivan counties prior to 1902. Sec. 58. A new section to make open season for hares and rabbits Sept. 1 to March 15. Sec. 71. To permit use of bough house for duck shooting on the ice. Sec. 72. To make open quail season Nov. 1 to Dec. 15. Sec. 73. Season for possession of quail Nov. 1 to Dec. 31. Secs. 74-76. 81. To make open season for woodcock and ruffed grouse Sept. 1 to Dec. 15; and forbidding taking by one person of more than thirty-six birds in a season. Possession allowed from Sept. 1 to Dec. 31. Transportation forbidden between any points except that if accompanied by owner twelve may be carried at one time, or thirty-six in a year by one person.

Sec. 76. To forbid for five years export of woodcock and ruffed grouse from Oswego county. Sec. 109. To forbid export of brant from Oswego county for five years. Sec. 75a. To make open season for woodcock in Clinton, Essex and Warren counties Aug. 16 to Dec. 15. Sec. 78. To forbid wearing as articles of dress wings, feathers or plumage of wild birds. Sec. 108. To make open season for land-locked salmon in Dutchess, Ulster, Sullivan, Orange, Rockland, Putnam, Westchester and Richmond counties April 1 to June 30, inclusive. Sec. 110. To make open season for pickerel, pike, wall-eyed pike, April 10 to Jan. 31. Sec. 110. To make black bass open season in Lake George and Schroon Lake Aug. 1 to Dec. 15. Sec. 114. To fix lawful size of salmon, land-locked salmon and lake trout at 15in. Sec. 132. To extend prohibition of netting within one mile of shore to waters of Lake Ontario in Jefferson county; also to remove the penalty for violation of the section. Sec. 141. To permit fishing through the ice with hooks, lines, tip-ups or spears for pickerel, bullheads, catfish, eels, perch and sunfish in waters inhabited by black or Oswego bass. Sec. 142. To permit: "Pickerel, pike, perch and bullheads may be fished for through the ice with hooks and lines, tip-ups or bobs in Honeoye Lake, Canadice Lake, Conesus Lake and Loon Lake in Steuben county." Sec. 143. To prohibit use of eel weirs and eel pots except as permitted by this section. Sec. 161. To forbid in Long Island waters killing wildfowl with any other than shoulder guns, or from any boat except propelled by hand. Sec. 162. To forbid use of floating devices in Long Island waters except in Long Island Sound, Great South Bay west of Smith's Point, Shinnecock and Peconic bays. Sec. 163. To make open season for snipe and shore birds on Long Island May 1 to Dec. 31. Sec. 164. To make close season for ruffed grouse and meadowlarks on Long Island Jan. 1 to Nov. 9, inclusive; woodcock Jan. 1 to July 31. Sec. 175. To make close season for meadow hens on Long Island Dec. 16 to Aug. 31. Sec. 170. To forbid use of dogs in deer hunting on Long Island until 1902. Sec. 249, which permits sale of game the year around. To repeal it. Chautauqua Lake.—To permit taking muskallonge and billfish through the ice on Mondays and Thursdays only for five consecutive weeks from the first Monday in January. Close season for black bass, yellow bass, rock bass (and muskallonge, except as hereinbefore provided), Dec. 1 to June 15.

Camp-Fire Flickerings.

"That reminds me."

Another Snake Story.

"SAM, bring around the mare!" "Yes, boss; yes, sir." Sam was cook and butler for old Col. Barbor, as fat and jolly a banana planter as could be found in all Costa Rica. The colonel originally hailed from Florida, weighed 290lbs., and was known among his friends as a good judge of liquid refreshments. The old mare was brought around to the front of the house, where a substantial cement horse block had been built, for being so portly a man it was impossible for him to mount his horse from the ground. The mare was of somewhat the same proportions as the colonel, very rotund and a weight carrier. It was a rare thing for the colonel ever to put her off a walk, consequently she was as fat as a butter ball. "Now, Sam, hold her head." And the colonel mounts and is off to inspect the plantation. The colonel, a bachelor, was afraid only of one thing on earth, and that was a snake, big or little alike. Perhaps an hour had elapsed when down the road came the mare on a full gallop, the colonel dashing the spurs into her side at every jump. Sam had seen the colonel coming, and he and the housekeeper had rushed out to see what was the matter. In the midst of a clatter of hoofs and a cloud of dust the colonel drew rein to the door, and the first thing he said was, "Oh, Sam, I'm snake bit!" He was already pale, his hat was gone, and he was trembling like a jelly. He was so weak that it took the united efforts of Sammy and the housekeeper to get him into the house. Then Sam broke down with grief. "Poor master is goin' to die," he wailed over and over again; and the housekeeper went into hysterics. "Sam! Oh, Sam! Give me some whisky—quick! Here are the keys."

Sam took the keys and made a quick journey to the store room. The colonel kept two qualities of whisky, one for his especial use and one for the farm hands. Sam not knowing the difference between the two kegs drew out a tumbler full of the poorer quality of whisky and rushed back to the colonel, who took it at two gulps and called for more. Back to the store room rushed Sam to draw off more, not forgetting to take a nip himself. So they gave the old man enough whisky to have intoxicated three men. About this time word had reached one or two of the neighbors that the poor old colonel had been snake bitten, and two of the men had ridden up to see if they could be of any assistance. One gentleman had brought a bottle of fine old Scotch whisky with him, the better half of which he insisted upon the colonel's taking. The colonel was already half tight, and after the Scotchman was gone his condition may be imagined rather than described. Under this treatment it was not long before the colonel would allow the removal of his riding boot, and he was so happy; he did not seem to care whether he was snake bitten or not. The doctor had been sent for, but had not arrived; still it had seemed best to remove the boot. The colonel begged for one more drink of whisky, which was given him. On the outside of the boot were found marks of the teeth of the snake; but examining his leg as closely as they could they could find no marks of any bite. The snake had bitten his boot, but the fangs had not penetrated to the flesh at all. It was nevertheless doubtless true that the colonel would have died of fright if he had not been given the whisky. As the case turned out it was a lucky thing the doctor had been sent for, for the colonel would undoubtedly have died from the effects of the bad whisky poured down his throat in such unlimited quantities; and it was all the doctor could do to bring him back to his original state of health. The colonel did not show himself for some days after this experience, and to this day always leaves the room if any one starts to tell a snake story.

FREDERICK S. LYMAN.

COSTA RICA.

Sea and River Fishing.

Fishing Up and Down the Potomac.

Chub at Four-Mile Run.

TWELVE miles away by train, six as the crow flies, nestled in the Virginia hills, is Carlyn Springs, now called Glen Carlyn, where the train drops you to a cinder path, alongside a pretty babbling brook, which ought to be a trout stream, but probably isn't. Mr. Jesse Middleton, who has lived at its mouth for a dozen years, and fished some part of it nearly every day of the season, has had in recent years three consignments of trout placed in the inviting waters; one of California, one of brook, and one of rainbow; and till now none have been found afterward. Each season some one reports a new fish somewhere up the creek, hopes are revived, and each trip brings some disappointment so far as trout are concerned. Just now a report brings the welcome news that trout have been seen, and within a fortnight another effort will probably be made to verify the rumor. How fortunate for the angler that hope springs eternal, and all that. With us, indeed, it is a hardy perennial.

It will be something of a triumph to secure a trout from this stream. What a generous flow of "I told you so's" will follow.

The bed of the brook is rock; its waters clear, cold and clean; but when the little trout drop down from its shallow course for the winter they may get lost, or die in the muddy marsh at its mouth.

But trout are not an indispensable necessity for a pleasant day along its winding course and shady banks. It is in most seasons chock full of chub, or fall-fish, as they are mostly called south. Those who have ever had a successful day with a fly among the chub, large, plenty and hungry, will never thereafter begrudge a kind word for the sport.

We have made this trip, walking down to the mouth of the stream, whipping it all the way, a good many times, and made some good catches in the ripples and pools, and found each day pleasanter than the last.

Before the train is out of sight we are fitting our rods, and commenting on the stage and state of the water and the probabilities of a good day.

To most anglers this would be considered very inferior sport, but one gets his day in the woods, with the sunshine and shadows, the singing water, and the birds, with all the fullness he would on a salmon river, and perhaps less interference with the thorough enjoyment of it all.

But the fishing itself may be a delight. Canon Kingsley, in his charming "Chalk Stream Studies," has apotheosized the chub in such a glowing tribute, as an object of sport, as must convince any reader of its attractions. To quote him will shift the responsibilities of championship to worthier shoulders.

"Very good sport they give, in my opinion, in spite of the contempt in which they are commonly held, as chicken-hearted fish who show no fight. True! but their very cowardice makes them the more difficult to catch; for no fish must you keep more out of sight, and farther off. The very shadow of the line (not to mention that of the rod) sends them flying to cover; and they rise so cautiously and quietly that they give excellent lessons in patience and nerve to a beginner.

"If the fly is dragged along the surface, or jerked suddenly from them, they flee from it in terror; and when they do, after due deliberation, take it in, their rise is so quiet that you can seldom tell whether your fish weighs ½lb. or 4½lbs. * * * No fish, therefore, will better teach the beginner the good old lesson 'not to frighten a fish before you have tired him.'"

He suggests the large palmers for flies, the larger and rougher the better, and the best of all—the imitation of the black beetle, called the 'undertaker' in the London shops.

He admits, however, they are not fine eating, and gives a ridiculous description of a very fair imitation of a cooked chub—a sperm candle, wick and all, stuffed with needles and split bristles, and stewed in ditch water.

Our experiences have not been exactly like his. We have found the chub rather a sudden biter when he comes at all; impulsive rather than deliberative; but if he misses the fly by first intention, whether he be pricked or not, you may as well try the next pool. He is far more wary than either trout or bass, and like opportunity, knocks but once at any man's door.

With a fly, the swift water is to be preferred; always the foot of a fall, but many times upon a shallow riffle, with but a skim of water purling over the shingle, when every shiny pebble is plain, and apparently no possible shelter for a fish—a big one comes from somewhere and gathers in the fly as it touches the water; the broken surface which breaks his view of the angler may hide him too, but it seems impossible, and has always been one of the mysteries to us.

And so we start on our tramp down the stream, and thereby do violence to the teachings of half the anglers who have written on the subject; they say you must fish up. The other half say down all right.

"But there is one great error in fly-fishing as usually practiced, and as recommended to be practiced by books, and that is that the angler 'fishes down' stream, whereas he should 'fish up.'"

Thus wrote W. C. Stewart in Pennell's Fishing Gossip in 1866.

In the American Angler's Guide, the first edition of which was issued in 1845, and the author's name appearing for the first time in the fifth edition in 1876, John J. Brown refers to the controversy already old: "There is much diversity of opinion about the manner of fishing, whether up or down the stream; the great majority of anglers, both in Europe and this country, favor the latter, and very few the former."

Kingsley says: "The next mistake, natural enough to the laziness of fallen man, is that of fishing down stream and not up."

Our Ned Buntline says: "Always, if possible, fish down stream; it is easier. You can detect swirls, eddies,

shaded pools, coverts of rock, mossy banks and overhanging branches. * * * You have also the aid of the current in guiding your fly to each coveted spot after it touches the water."

These are fair types of dozens of authorities on both sides of this long waged and still unsettled controversy. And it never will be settled, because both are sometimes right, depending on the conditions of water and wind, and sun; the character of the stream; the location of hiding places; the nature of the bottom; the trees upon the bank; and much on the skill of the fisherman himself, and his familiarity with the brook and its denizens.

We fish this one down. We get off the train and walk home—that is, to my friend's home, where we are sure of an angler's dinner—and it just makes a pleasant day's tramp of a half dozen miles.

We always carry a dozen large black marshworms for this trip, for there are sundry places we remember where in the tangled roots of some dead giant of the forest, fast set in pools a fathom deep, some of the largest chubs have their local habitation; and if we have been indiscreet, and frightened them, or they were not happening on that particular occasion to be wandering from their own chimney corner, such a delicacy weighted with a single swan shot and dropped down into the lair will sometimes entice them forth; sometimes we leave them the hooks as souvenirs of the invitation, but that's all in the play.

The worm is not perhaps aristocratic, but it will get some fish which no other known bait will, and it is an old proverb that "not all fish are caught with flies."

Who does not recall Irving's story, which is as old as Jonah, but which sounds so fresh in his breezy vein, and seems so real when he vouches for it with such confidence? "I recollect also that after toiling and watching and creeping about for the greater part of a day, with scarcely any success, in spite of all of our admirable apparatus, a lubberly country urchin came down from the hills with a rod made from the branch of a tree, a few yards of twine, and as Heaven shall help me! I believe a crooked pin for a hook, baited with a vile earthworm, and in half an hour caught more fish than we had nibbles throughout the day."

Frank R. Stockton had little faith in this hoary narrative, for he says of it: "That old story about the little boy with the pin hook, who, ketched all the fish, while the gentleman who stood alongside of him kep' throwin' out his beautiful flies and never got nothin'—is a pure lie."

But if it was ever true, it might have been of Irving's crowd, for the boy was an artist, beside the painful efforts he describes.

He retired early from the attempt, and lying on his back in the grass, building castles in the clouds, and listening to some one else read Izaak Walton, he fell fast asleep—and the boy fished on.

On one of our later trips we took 150 chubs, hoping each one a trout, but returned to the stream all but a dozen apiece, which we brought home to show, and then placed them where they would do the most good.

A mile below where we start in, at Glen Carlyn, the run passes close to the station of Arlington, several miles in the rear of the old Robert E. Lee mansion. Not far from this a little tributary makes in from the north called Lover's Run. This flows through the estate, and the romantic name of Lover's Tryst is still given a pretty stretch along its banks, which legend has it was a once popular stroll, where Cupid's captives were wont to take the air. A couple of miles further down the little settlement of Nauk stands upon the site of what thirty-five years ago was Convalescent Camp. Remains of a rifle pit or two may yet be traced, and between that and the river, almost hidden in the post-bellum forest, are the ruins of a rather imposing mud fort—a grim reminder to the present generation of the horrors of war, but still more interesting as suggesting the strides which the art of destruction has made since then, and the revolution in military methods which the next serious contest will develop.

The last pool before the run enters the marsh at its mouth was reached just at sunset on our last trip. The shadows were already deepening under the trees. Hastily tying on a pair of white millers on No. 6 hooks, three doubles, of ½lb. each, were taken out in almost as many minutes—a fitting closing to a glorious day.

HENRY TALBOTT.

Moosehead Lake Streams.

Report of the Commissioners of Inland Fisheries and Game.

THE Commissioners received a petition presented in conformity with Chapter 10, Section 76, of the Revised Statutes, as follows:

"We, the undersigned, believing that it will be for the interests and protection of our trout, especially the smaller ones, that are found in great abundance in the streams flowing into Moosehead Lake, immediately after the departure of the ice, respectfully ask that your honorable board cause to be closed during the month of May, 1898, the mouths of all streams flowing into Moosehead Lake, the same to apply to rivers, and that all fishing shall be prohibited within twenty-five rods of the mouths of such streams and rivers."

The petition was signed by many guides and resident land owners, hotel proprietors and merchants, living in the vicinity of the waters to be affected. There was also a petition presented at the same time asking for a close season to be established in all of the inlets of the lake from Oct. 1 to June 10 of each year.

The hearing, which was largely attended, with much earnestness manifested, was held at the Lake House, Greenville, March 8, 1898. There was developed a great variety of opinions as to what was wanted, some of the petitioners advocating a close time in the mouths of the twenty-one streams (tributaries to the lake), extending twenty-five rods into the lake, till June 1 of each year. There appeared to be unanimity of opinion as to the closing of all the inlets of the lake from Oct. 1 to June 10.

While fully realizing the great importance of these inlets as nurseries to the lake, and being of the opinion that they ought to be closed to all fishing all of the

time, we are of the opinion that no substantial benefit would accrue by simply closing them from the time the ice goes out of the lake in the spring until June 10. The fishing during this time is always good in the lake; and it is not until warmer weather, when it is more difficult to take fish in the lake, that these inlets are resorted to by fishermen.

We do not think the possible benefit to be derived commensurate with the necessary outlay, and therefore do not establish the rules and regulations closing these inlets.

It is a matter of common knowledge that Moosehead Lake is the largest body of fresh water in Maine, and is resorted to annually by many thousands of people from this and other States for purposes of fishing, rest and recreation.

The State annually expends a very considerable amount of money for the purpose of restocking it with trout and landlocked salmon, in order to keep up the supply of these fish for the ever increasing drainage upon its resources.

The petitioners introduced much testimony tending to show that as soon as the ice "went out" from the lake in the spring the trout, especially the smaller ones, gathered in large numbers at the mouths of these streams, and were taken in destructive quantities by steamboat parties and others, to the great injury of the fishing later on in the season. It was claimed that the habits of the small trout are so universally known in this respect, and taken advantage of by such large numbers of fishermen, as to seriously endanger the future supply in the lake.

The Commissioners, in view of the magnitude of the interests involved, and in view of the many earnest protests received from citizens of this State, conclude that we are not justified in granting the prayer of the petitioners to close the mouths of these inlets as prayed for by the petitioners.

The State at large is deeply interested in this matter, to say nothing of the large number of non-residents who are directly interested therein.

To close twenty-one places in Moosehead Lake against fishing, or indeed to close any portion of this great resort against fishing for any period of time in which it is now lawful to fish therein, involves the rights and privileges of so many citizens of the State that in our opinion it is a question that should be dealt with by the Legislature alone.

LEROY I. CARLETON,
HENRY O. STANLEY,
CHAS. E. OAK,
Commissioners of Inland Fisheries and Game.

ANGLING NOTES.

The Leap of the Tarpon.

ONCE upon a time, not so very long ago, I went fishing with two friends, and after an all-night journey on a sleeping car we breakfasted and changed to another railroad and rode for the best part of the forenoon, and then drove ten miles in a wagon to the water in which we were to fish. That, in fact, was about all we did do, except to come home again, for we caught no fish. We did fish, and we got thoroughly drenched in a rainstorm, and the next day we had to take shelter from a windstorm that threatened to swamp our boats; but we did not get a single fish. The people said we were too early for black bass, and that was the fish we were after; but that was not the real reason, for there was a hoodoo on us, and the hoodoo was in the form of a dress coat and a bright red necktie, the latter worn by one of my friends, and the former packed (so my friend said) by mistake for a flannel shirt and a pair of fishing shoes. Had he worn his dress coat with his red necktie, I might not have been here this night at my desk; but as he only put on the red necktie, the hoodoo was fatal only to the fishing, and not to the fishermen.

Little did I think, after that experience, that I would ever start on a fishing trip dressed in evening clothes; but I did, and I now write of it as a solemn warning to others—never, under any circumstances, go fishing in evening dress, if you expect to catch fish. If one has nothing but a dress coat to fish in, don't fish; and if one can only start on a fishing trip in evening dress, don't start. Stay where the evening clothes are the vogue and have the best time one can, for the fish will not bite when such a hoodoo is working. We—and we means Merrel N. Goddard and Shell Fish Commissioner Edward Thompson, both of New York, and the writer—were entertaining the commanders of two of our torpedo boats at dinner at Tampa Bay Hotel, and a social function was to follow the dinner, so evening dress was demanded. That was all right enough by itself, but we had been invited to go fishing the next day, some forty odd miles from the dinner and the function, and we had to get to the place before we could fish, and the only way to do this was to take a late special train from Tampa to Port Tampa, and at 4:30 the next morning cross the bay on a steamer that Mr. Plant kindly offered to place at our disposal, and in this way catch a train that would take us to where some kind-hearted gentlemen would be waiting to drive us to a point where we could catch Spanish mackerel, weakfish and redfish or channel bass. There was no question whatever about our catching the fish if we could reach the place. We held a meeting and discussed the situation. Should we attend the function after dinner dressed in knickerbockers and golf stockings, or should we omit the function and just get ready for fishing in the regular way? Our guests would expect to attend the function, probably, and if so, that would settle that part of it. The function was too much of a function for us to appear in any but evening dress; no excuse that we could dream of would condone the golf stocking, and each of the three knew in his heart that he was wasting time in proposing anything but a "half-tailed coat" and a society smile. Goddard solved the problem when he said: "There is but one thing left to do; we will dress for dinner and attend the function, and put our fishing clothes into a portmanteau and send it to the train; and after we have attended the function we will make a rush for the train at the last moment, go to Port Tampa, sleep if there is any time for sleeping,

and change our clothes there before we cross the bay." It will be readily seen that we did not bring the hoodoo on ourselves; it was thrust upon us, and really we should not have been held responsible when we reached the fishing ground for having a hoodoo secreted about our persons. There were people on the train that night that no doubt wondered what relation dress coats had to fishing rods; but if they did, we did not tell them. Our naval friends went aboard their ship shortly after 1 o'clock, and we went to bed to be called at 4 A. M. To this day I am not exactly sure whether Thompson really had Eastern time, and made a mistake, or thought two hours' sleep was enough; but he called us at 3 A. M. and said he had made a mistake of an hour in his watch. Now there was a watchman to do the watching and the calling, and if Thompson had attended to sleeping and not to his watch we would have had just one hour's sleep when we needed it. We crossed the bay in the dark and got the train and ran up to Clearwater on the Gulf, where our hosts were waiting for us. Up to this point we had no idea that the hoodoo was getting in its deadly work, and we listened to the stories of big catches of fish with undisguised joy, and for my part I secretly decided that I would not make a beast of myself simply because the fish were there in shoals ready to bite my hook, but would content myself with two or three good fish and stop the deadly work. There has been so much of fish slaughter in Florida for the purpose of making big scores that I was determined to curb any inclination that led me in that direction. We discussed this matter among ourselves finally, and all agreed that we would take only such fish as our friends could dispose of at their homes, and that we would take none of the catch back to the hotel. It was a pleasant drive from Clearwater to Bayview on Tampa Bay, through the pines, with doves flying up in flocks from the old fields, orange groves and pineapple farms—giving evidence that frost had not visited that region.

At Bayview a wharf extends far out into the bay, and the members of the party were quickly posted along the wharf, each one fishing as his desires inclined. I was baited for channel bass—anything over 20lbs. in weight—while others fished for other kinds of fish. Our hosts told us that it was a pity that the wind was blowing so hard on shore, for it made the shallow water very roily, and that was bad for the fishing; but later the wind would probably go down. I began to suspect something as soon as I got out on the dock, but I did not wish to confess that we had a hoodoo with us, and was silent when the gentlemen began to blame the high wind and roily water. Even Goddard and Thompson fell in with the wind and roily water theory, and up to this moment I am the only one of the entire party that knows why we got no fish that day; but it has become a burden to my conscience and I am forced to make a confession, that the water and wind may no longer be held responsible. When I was fully satisfied that the hoodoo was actually at work I reeled in my line and went on shore. Goddard says I went ashore to take a nap; that he was no half-day fisherman, but would perch on that wharf until the sun went down. It was not in my heart to tell him the cold truth, and I let him fish on, hoping all the time he would not first fall asleep and then into the water. It is true that I did take a nap, and it was a very good nap and quite refreshing after a week of staying up o' nights; and after the nap I sat on the shore with one of our hosts watching a school of porpoises directly in front of us in the bay. The porpoises rolled nearer and nearer to the shore, and the gulls screamed overhead in a great flock, when suddenly out of the water came a mass of silver in the form of a fish that glistened in the sunlight. My friend exclaimed: "See that tarpon!" But I had seen the fish the moment it appeared. The jump was not a great one, but quicker than I can tell it the tarpon made a second leap, greater than the first, and almost instantly a third leap, and that was a corker. The first and second were simply to get in motion for the third jump, which seemed to be like Reuben Leonard's cast at Madison Square Garden—a record breaker. That leap of the tarpon was alone worth all the night ride, loss of sleep, lack of breakfast, and other minor discomforts, and it almost seemed as though the leap was made for exhibition purposes alone. As I sat on shore the fish was broadside to me, and those on the wharf saw him head on, but every one knew it was the silver king taking exercise. Well, that was all we got of fish—just a leap of a tarpon, nothing on our hooks. Goddard said if the water had been clear we might have hooked a tarpon, but we would not have hooked a tarpon had they been there as thick as range cattle at a round-up, for the hoodoo was safely packed in the portmanteau, and when he reads this he will for the first time know that the water and the wind had nothing to do with our ill luck. Thompson did try to convict me of driving all the fish out of the bay by snoring when I was asleep, but this claim was not tenable, for I did not take a nap until after luncheon, and there were no fish in the morning; and furthermore, as I can easily prove, I never snore except when I sleep very soundly. No; I have given the only and true reason for our lack of fish—it was the hoodoo, and it is the only hoodoo (dress coat and red necktie) that I firmly believe in.

Joe Jefferson's Tarpon Rod.

This is not written to be read by tarpon fishermen, if they are at all sensitive, but even to a man up a tree I think it will be admitted that a tarpon rod is not a thing of beauty when compared with a single-handed trout rod made for fly-casting. It is a sturdy, robust tool, all right enough for what it is intended to accomplish; but to one who fishes chiefly with a fly for trout or salmon the tarpon rod always seems odd. Goddard and I were talking of fish and fishing with Joe Jefferson at St. Augustine. Mr. Jefferson had just arrived from the North, and we were about leaving the South for the North, and were having a little fish gossip about what we had not done and what Mr. Jefferson expected to do, when I mentioned the leap of the tarpon in Tampa Bay. The veteran actor and angler smiled and asked: "Did I ever tell you about the tarpon rod Sandy sent me?" Now the Sandy referred to is a most accomplished salmon and trout angler, and with Mr. Jefferson owns a portion of a salmon river in Canada. He has an abiding faith in the rods made by Forest &

Son, of Kelso, Scotland, as I happen to know. I had not heard of the tarpon rod presentation, and Mr. Jefferson told the story. "Sandy thought I ought to have a tarpon rod, and all unknown to me he sent over to Forest and ordered one, and when it was finished he sent it to me just as I was about to start for the South one winter. I don't know what Forest thought of the rod, but when I opened the package containing it and saw what was in it I concluded that a mistake had been made by somebody, for the tarpon rod was nothing but a billiard cue with guides and a reel seat on it. I concluded that Forest must have had two orders, one for a billiard cue for one of our champions, and one for a rod, and not knowing about tarpon rods had got the two orders mixed and put the guides on the billiard cue; but I was assured that the weapon was actually a tarpon rod, and have never dared to use it—for a fish that requires that sort of a rod to land it would pull me into the water if I should hook it."

The day before this story was told, Mr. Blackford, who had left us at Tampa to go down the East Coast, met us at St. Augustine, and we had a talk about the fishing where he had been. Looking at me out of the corner of his eye in a manner peculiar to him when some kinds of fish stories are told, he said: "I heard of so many pompano (it was a large number, so large I do not wish to put it on white paper with black ink) being taken while I was—well, on the planet Mars—taken with hook and line!" Then I looked at Mr. Blackford out of the corner of my eye, too full of emotion to say a word. Mr. Jefferson said that he was in the habit of going to this place, on the planet Mars, in fact was then on his way there. I was reminded of Mr. Blackford's pompano story, and I asked Mr. Jefferson if it was customary to take a hundred and odd pompano with hook and line in a day. Very emphatically he said: "No," that pompano were taken with hook and line just about as often as herring were taken with a hook—semi-occasionally, and apparently more by accident than design. As this was as I had taught myself to believe of this most excellent table fish, I was sorry that Mr. Blackford was not there to hear what Mr. Jefferson said; but there was something about the look in Mr. Blackford's eye that made me think he did not believe the story when he heard it. It really pains me not to believe any kind of a fish story (and it is safe to believe most kinds), for fish are always doing strange things, and I do not wish to become a doubter. If a man should tell me that he caught 100 pompano with a hook in one day, on the planet Mars, I could not dispute him, for I have never been there, and if I had been there it would be no reason for me to doubt the story simply because I had failed to do the same thing, or because no one else that I had ever heard of had caught pompano at that rate with a hook. Things may be happening all the time in some neighboring precinct that never happen in your own bailiwick, even with fish, and I always try to accept all that I hear that fish have done, or that has been done to fish; and yet, after all, I am glad that Mr. Jefferson explained what he knew about pompano fishing with hook and line in the waters around the planet Mars, for it corresponds to what is commonly accepted concerning the habits of the fish.

Bream vs. Black Bass.

In connection with the National Fisheries Congress at Tampa, there was an exhibition of Florida fishes frozen in cakes of ice, and a fine exhibition it was. One morning I went into the Exposition building to see some fish exhibits, and the card at the base of one of the cakes of ice informed me that the fish imprisoned in the ice was a "bream." The fish to me was a large-mouth black bass, and I assumed that the cards had become disarranged, and I asked the man in charge where the bream was, and he pointed to the black bass, saying: "That's the brim," pronouncing the word as I would if I referred to the brim of my hat. "But," I said, "that is a black bass." "No, it's a brim." "Do you also call it a trout?" "Yes, it is a brim or trout, but not a black bass." Thus it was that I learned of a new name for the large-mouth black bass. I was familiar with the black bass as a trout and as a chub, and had heard of it as perch, jumping perch, black trout, welshman, and a score of other names in which bass formed a part, but it was absolutely new to me to have the big-mouth black bass parade under the alias "brim." A gentleman once wrote to me about a fish which he referred to all through his letter as a chub, and as his letter was dated in New York city I was at a loss to locate his fish, for it did not conform to any chub that I knew of. I have often identified a fish under an unusual common name from the date line of the letter making the inquiry, but this New York chub was too much for me. I asked where my correspondent had caught this, to me, peculiar chub, and when he said Virginia I knew it was the black bass, for the peculiarities fitted the black bass, and if the gentleman had written from his home instead of where he was, visiting he would have indicated the fish to me. Now in my memorandum book there is this entry: "A bream may mean black bass when it is mentioned by a native of Florida."

Stop Nets.

Florida boasts of her fishes and fishing, and well she may, for in spite of the personal experiences already related in these notes her wealth of fishes, of many species, is enormous. With a coast line which, if extended north from Jacksonville, would reach nearly to the State of Maine, and with more lakes within her borders than are possessed by New England, the field for fishing is vast; and more than that, the waters swarm with fish. It is this very abundance, however, that gives rise to waste, and unless the methods of fishing now employed are modified Florida will find herself with some of her fisheries worn out before all are developed. On a trip to Mullet Key I had a long talk with a fish dealer from Georgia, who maintains three fishing stations in that neighborhood. In explaining to me how his business was conducted, how fish were caught and brought to market, he mentioned among other nets in use a "stop net," and it being new to me I asked how it was operated and where it got its name. A small bay is selected, and at high tide a net is stretched across its mouth, and as the tide goes out all the fish in the bay are stopped by the net, little and big, and all kinds are imprisoned by

the stop net, and at low tide the marketable fish are selected and the others take their chances of being left on a mud bank until another tide. My friend the fisherman admitted that the method was destructive and many fish were absolutely destroyed from various causes. The catch might overstock the market or the fish might be "stopped" when the supply of ice was low, so that altogether it was a questionable method of fishing, and was quite apt to operate against a further supply of fish. He said that after listening to the papers and discussions at the Fisheries Congress he believed it wisdom on his part to abolish the stop net in his fishing operations and consider the future as well as the present supply. Where fish are so abundant as they are in Florida it is difficult to comprehend that the supply may be cut off in the future by injudicious methods employed in their capture, and by taking certain species at the spawning season. Already fears have been expressed that the tarpon fishing is now suffering because the fish are killed on their way to the spawning grounds, and that spent fish are killed which offer little or no sport as compared with a fish in prime condition. A letter calling attention to this state of affairs was read before the Fisheries Congress, and it will form part of the printed proceedings. At my request this letter was published in Florida papers, asking that those who knew of the habits of the tarpon would communicate with me, for the habits of the silver king are not yet fully understood; but I have received no communication on the subject.

Fly-Casting in Florida.

It was announced that a fly-casting tournament would be held at Tampa, Fla., during the meeting of the Fisheries Congress, and Mr. Goddard, fresh from victories at Madison Square Garden during the Sportsmen's Exposition, and who was appointed by Gov. Black as a delegate from the State of New York, went prepared to enter several of the contests. The congress resolved itself into a serious business convention, and there seemed to be no place for an entertainment so light and airy as a fly-casting contest with trout rods. A paper on the habits of the oyster, its cultivation and development, aroused a discussion that lasted long after the session of the day, and transporting fish from the net to the consumer would be debated for hours; but not a paper was read or discussion held upon angling pure and simple, and so the fly-casting contest was crowded out. And yet among the serious-minded men gathered at Tampa there were some who desired to see how a fly was cast with light rod for distance, and one evening Mr. Goddard took his rods down to the river and showed the people such casting as they had never before dreamed of; and the enthusiasm was such as to prove conclusively that such a contest would have been extremely popular. At St. Augustine, again, Mr. Goddard was persuaded to give an exhibition before a large crowd, and with a 4oz. rod he cast 86ft., and with a 10oz. rod 101ft.

A. N. CHENEY.

Trouting in the Black Forest.

BY FRED MATHER.

IN childhood the fearful tales of dark deeds done in the depths of the black forest of Germany, the dreaded Schwarzwald, made an impression never to be effaced. Ghastly legends of wayside inns which offered the traveler rest for the night and gave him rest for eternity; of mysterious disappearances of men who could never be traced; and of later discoveries of bones which were past identification. Just where this mysterious and forbidding country might be my childish mind had no definite idea; it was somewhere off in the unknown world, and I never bothered about its exact location any more than I did about the garden where Jack raised his beanstalk, the place where he built his historic house, or where he killed his giants; nor indeed if the three Jacks were all one and the same individual.

Some twenty years ago I was seated in a Berlin café, talking with Count von dem Borne, the noted fishculturist, when he remarked: "You should go to Baden and see the fish-breeding establishment of Carl Schuster, the Ober-Bürgermeister of Freiburg. You will not need a letter of introduction, for he wrote me a week ago saying that he hoped you would visit him."

And so it came about that I took an evening train for Freiburg in Baden, some 300 miles to the southwest. The morning gave glimpses of the valley of the Rhine, and here and there a peep at the river itself, and Heidelberg, Carlsruhe and other historic places were passed. This was well for a while, but unfortunately for me I am constructed on the same general plan of architecture that other men are; and about 10 A. M. there was a loss of interest in the scenery, the fertile valleys and the prolific vineyards. There was that base and ignoble desire to eat which somehow seems common to man and his earthly companions, from the highest mammals to the lowest protozoan. I sighed for the army hard-tack stamped "A. D. 1;" for the anhydrous bean, or the beef dried on the hoof which marched with us in former years. I approached the guard and asked in the best of German how long before "freestick," but alas! he did not understand his own language. "Breakfast, freestick!" I yelled, for it is always best to yell when you are not understood, but as all the passengers made a bolt for a particular room in the station I bolted too, and had a most satisfactory "freestick." The Germans don't spell it that way, and I don't spell it in any other way—it is literally an "early piece," and is just as satisfying as if they called it breakfast. There was good coffee, and the meats were sausage of many kinds, for Germany is the land of sausage, and there might be wurst. Veal and hares rank next, and I ate the hare in both the stewed and roast form.

It is a fact that the hare is an appreciable factor in the food of the Germans. It is found in most all restaurants and cafés, but it abounds in the railway eating houses. In America it is not popular because, perhaps, it has a dry quality; but when this is overcome in a stew it is a good dish, and I often buy our little cottontail in the market, although I do not now take long tramps in the winter after him.

After the generous breakfast, and before we get into

the mysterious region of the Schwarzwald, let me digress in order to consider the hare, rabbit, *et omne genus*, as it exists in America.

Within a fortnight the editor of FOREST AND STREAM put a plain, straightforward question to me in language like this: "Do you consider the rabbit as game or as vermin?"

I gave him an evasive answer, which is not warranted to turn wrath aside, but may sometimes parry a direct question. Said I: "There are two sides to the question, and I will give them both my best judicial attention, without splitting hares, and ferret out the differences between a European hare and a Welsh rabbit, even if I have to call in a 'golden buck' as a rebutter; and will give you the decision later." And so a threatened discussion of the merits and demerits of the non-succulent hare and rabbit was postponed.

A telegram had brought Herr Schuster to the station, and somehow we met. He knew neither English nor my German; and again I wondered; not at his ignorance of English—that was natural—but why no person in Germany understood the language of the country. Afterward I had this fully explained. It was due to the very different pronunciation of the vowels. On the home trip I dropped in to see Dr. Otto Finsch, a world-known zoölogist, then in charge of the museum at Bremen. In course of conversation I said: "While Europe is richer in species of cyprinoids, America excels in the pike family; we have at least five species of *Esox*, while Europe has but one, and that one we also have."

"I do not know the fish you speak of," replied the Doctor; "are you sure it exists in Europe?"

"Surely; it is the common *Esox lucius*, called 'hecht' in Germany; you know the fish well!"

He grasped the meaning at once and corrected what, to him, was my mispronunciation, and drawing a long breath, ejaculated: "Oh, ah! *Aysoax*." And we got along splendidly afterward in our talk about *Esox*, and then it dawned upon me that the Germans understood their own language, but did not know how to pronounce it.

Herr Ober-Bürgermeister Schuster was a strong, intelligent man of fifty-five years then, and I was ten years his junior. He hustled me into his carriage after a hearty handshake and a mutual attempt at conversation which somehow ran into an *abattis* and never got out alive, as has been the case with many braver men.

The coachman stopped before a private dwelling, and Herr Schuster got out and held an animated conversation with a middle-aged, stout gentleman, who came out and said: "Permit me to introduce myself as Capt. George John Malcolm, of Her Britannic Majesty's Navy, Retired, and to beg that you will stop with me to-night and rest before you go to inspect the fishery at Selzenhof to-morrow."

There is a suspicion that I have quoted De Balzac in saying: "I can resist anything but temptation." But it will bear repetition, for the temptation was great; it meant an evening with a cultivated gentleman who would not require an interpreter if the talk should stray away from "Eisenbahn, was cost das? Kalbsbraten; ich bitte, halbe flasche Pontet Canet," etc., in which I was fairly proficient. So with an "auf wiedersehen" I shook hands with Mr. Schuster and entered the hospitable door of my new friend. He had married a charming German lady, and his wife and daughters spoke English with more or less difficulty. After supper, when Capt. Malcolm and I were left alone to burn some of the Virginia weed in his den, he told me that of late years he had spoken English so little that it seemed almost a foreign language to him. Our talk naturally drifted to fish-culture and my mission to Germany, and he showed some knowledge of the subject, for Schuster and he were close friends.

"Said he: 'My interest in angling naturally interests me in fishculture, and I've tried to interest Schuster in angling, but have failed. The Germans are fond of shooting, especially of hares and pheasants; but they do not look on angling as a sport; they only regard it as a means of getting fish for the table, and as this may be accomplished quicker with a net, they ridicule my expenditure of time and labor in casting the fly for trout. By the way, do you care to fish?'"

If any man who has written of angling since the first issue of FOREST AND STREAM, say as Charles Hallock and I have done, imagines that his reputation is world-wide and all wool, it will do him good to have a stranger ask him that question. It broadens his views, and like the traveled toad he finds that his voice which re-echoed from the hillocks about his own puddle has not reached beyond those confines. I answered: "From boyhood angling has been a favorite sport, and in later years I have learned to cast the fly and to enjoy that best of all forms of angling."

Capt. Malcolm jumped up, grasped both my hands, and said: "This is a treat. I will drive you to the hatchery in the morning, about four and a half miles, and we will take a few trout in the evening in a nearby stream; but as a fly-fisher I have been lonesome here for years. I want you to promise to make my house your home for at least three weeks and fish the black forest with me. Will you do it?"

"I can't promise you all those weeks, but I've read of the black forest; how far is it from here?"

"My dear sir, you are on the edge of the famous Schwarzwald now, and in fact in it. Schlafen sie wohl!" And he closed my room door.

In a German hotel you can order your bed made as you please, and raise all kinds of a rumpus until you are suited, but in a private house the German bed is not only of feathers, but the only covering is another feather-stuffed abomination; you can't throw off a portion if too warm, and you can't complain. There you are! As I can endure feathers in a pillow, and nowhere else, I dressed, put a pillow on the floor, and slept the sleep of a tired fisherman on a luxurious hard bed—the only kind of bed that truly gives rest and refreshment to the tired man who is educated to enjoy it. The Germans love to sleep on feathers, and my grandmother did. Selah!

A trip to the hatchery and an inspection of the ponds and processes seemed to bore my host; he was anxious to be on the stream. The hatchery was some four English miles from Freiburg, and as the rods were in the carriage I told Mr. Schuster that we would come again,

and away we went to a small brook a few miles away. It was a charming stream, tumbling, rippling and leaping in joy in one place, and then quieting down gradually into a pool as sedate as a schoolma'am when on duty.

Here I saw my first brown trout, one of 4oz., taken on a yellow-sally, and I looked so long at it that my companion took two before I was ready to cast again, and the Captain suggested that I try a few more casts and muster the catch for inspection afterward. We were fishing in waders, and to stay in them out of the water long is torture. I have no love for waders and less for wading a cold stream without them, so I stepped into the cooling water and cast again. We took twenty trout, which in the aggregate weighed over 5lbs., and had a delightful drive home through the cool forest.

In the early evening, after dinner, the strange trout were inspected one by one. No red-bellies, of course—only chars have that color, and the American brook trout is a char. But the red spots, on a larger white spot, varied so much that no two were alike. Absorbed in this, I was unconscious that I was unsociable until my host asked: "What do you think of our European trout?"

"Not as brilliant as the American char, which we call a trout, but for fish of their weight they are fully as game. Of their table qualities I may be better prepared to speak in the morning." Later six German friends of my host dropped in, some of them being men whom he had tried to make anglers of, and he expatiated on the casting and handling of a trout by his friend from America until my cheek got warm and I explained that I was not the only fly-fisher who lived across the Atlantic, and that the American angler was a natural result from the English settlement on that continent, because at the time of the settlement there were no men who fished for sport, and were thereby entitled to be called anglers, except Englishmen.

"Gentlemen," said I, "scholars may trace the name of 'England' to as many sources as they will; but it is my private opinion, here publicly expressed, that the name came from a fish hook. Does not Cleopatra say to Mardian: 'Give me mine angle—we'll to the river'? And Walton: 'I am, sir, a brother of the angle'? And this proves that a bent fish hook was termed 'an angle,' and that the name of 'England' is a corrupted form of 'Angleland,' or a land of anglers, of which Capt. Malcolm, of Her Majesty's Navy, Retired, is one of the most clever exponents and missionaries in a land where sportsmanship is almost wholly confined to the gun." As I sat down after this rhetorical effort, the greatest of my life, there were cries of "Prosit!" "Gesundheit!" and other German exclamations, none of which were intelligible to me; and then the evening was spent in whist, wherein I am a veritable duffer. When the guests had departed the Captain asked what my plans were.

"I think I will visit the hatchery and ponds, give them a careful inspection, and take the evening train for Berlin."

"Is your stay so limited that you must tear off to Berlin to-night and catch the first steamer for New York?"

"By no means. After my mission is accomplished I have Prof. Baird's permission to remain in Europe as long as I like."

"Good! Then let me beg you to make my house your home for as long a time as you please, and fish with me in other parts of the black forest. It will be an act of charity in you to do this, for I have actually hungered for a fly-fishing companion. I go out alone here, and while I do not meet with open ridicule, I know the average German thinks my methods a harmless form of insanity, for the German is not an angler, much less a fly-fisher. There are a few exceptions, but they are scattered, and only emphasize the rule. Neither are the French anglers; they fish, to be sure, but their sole idea is to get fish for the table in some way, and they have no idea of it as a sport, to be conducted fairly, as they would shoot partridges over dogs. Now I beg of you to give me a few days of pleasurable fishing with you."

An angler would be made of sterner stuff than I if he could tear himself away from such a proposition. To fish for a strange trout in the strange, romantic depths of the black forest, and with a host who was as enthusiastic as a boy! It has been said: "Temptation hath a music for all ears," and there was music in this; and I jumped at the bait.

And this was really the mysterious black forest of my childish reading. Until now it never had a local habitation, if it did possess a name, but had seemed like the intangible places mentioned in the stories which began: "Once upon a time," and were as geographically indefinite as they were chronologically. As I lay down, a few stories of human bones being found in the charcoal pits, and in disused wells, floated about the room for a few minutes, and somehow it was morning.

The fried trout were good; in fact, very much like our own trout when taken out of mountain lakes or streams, and had no flavor of mud or weeds, which some of our pond trout have. "Capt. Malcolm," said I, "this is a grand fish to catch, and a good one for the table, and I read that it grows to a weight of 15lbs. or more in England. When I go to America I will try to introduce this trout there for our rivers." The opportunity came in 1883, and I obtained the eggs as a personal present from Herr von Behr, President of the German Fishery Association, and fearing accident to them in the rickety old building which I was using for a hatchery, I presented some to other pisciculturists, and the United States Fish Commissioner, McDonald, took the unwarranted liberty of changing the good old English name of "brown trout" to "Von Behr trout," and at the Caledonia hatchery they called them "German trout"; but those names will never stick, because they do not express the characteristic color of the fish, are not so handy, and brown trout is the good old English name which I imported with the fish in embryo; and I have rights in this matter.

"Promise me a week?" inquired the Captain; and I promised. This gave me a full day with Mr. Schuster without jealousy on the part of the Captain, who kindly drove me out and came for me at night. There was a suspicion of preparation for something in the Captain's family which was manifest in a scarcely perceptible excitement, but I made a mental note of it. The Captain

proposed chess and beat me two games, after which he said: "Schlafen sie wohl," and his next remark was: "Good morning."

After breakfast he asked me to pack my bag—"satchel" in Americanese—for a four days' trip. "We will drive to St. Blasien and take a few there and on the way," said my host; and I could only remark: "That will be excellent." But where or who St. Blasien was did not concern me. The team stepped off lively, and we found space for our legs amid baskets, fishing rods, wading boots, creels and other impedimenta. The morning was clear and the air seemed to inspire a wish for wings to float on it, and the way was all up hill until at noon we reached the Stern Inn, where we baited the horses and ourselves. "We will not fish to-day, but will take a tramp on foot, for I wish to show you some German scenery which will be well worth the shoe leather, and which you may never have another chance to see."

So, filling our creels with provisions, we started, leaving the coach road for a mountain trail, and with frequent rests and as many refreshments—for what so stimulates the appetite as mountain climbing and an occasional spring of mountain water? The springs evidently were placed at the proper distance to restore all moisture spent in breathing, and drink naturally suggested a rest; and then came hunger, more drink, and the column moved forward. About sundown we reached the cabin of a wood-cutter and charcoal burner, and arranged to spend the night. The very place described in the horrible tales of childhood, and to complete the picture in came the charcoal burner and four stalwart sons. Our contribution of tea and sugar was acceptable, and after the men had washed they did not look so diabolical. Our tobacco was better than that they usually burned, and the Captain chatted freely with them; but I was naturally silent. A question to me was answered by the Captain, in which the only recognizable word was "Americanish," with the broad sound on the second "a," and then I felt as if I were a freak in a dime museum on the first day. If I exchanged a word with my friend, all eyes were on me, and I felt my inferiority keenly.

When we climbed the ladder to sleep on the straw in the loft, the story of the lone traveler in the black forest was repeated, except that he understood the language and had gone to sleep and was awakened by the charcoal burners, who spoke in whispers; was he asleep? Then the sharpening of knives, the careful ascent to his loft while he cocked his pistols under the bed clothes, the stealthy tread of a man on his floor who approached his bed, reached up and cut a chunk of bacon which hung from the rafters and went below to have it cooked. With this as a last thought on the bed of straw, a tired mountain climber found that morning had come before he knew he was asleep, and the charcoal burners had gone to their work.

A bite, a short tramp and a halt. "Here," said the Captain, "is the summit of the Feldberg, the highest peak in the black forest. Through the clear atmosphere you can look across the Bodensee, which the English call Lake Constance, for some reason unknown to me, and see the Alps. Turning around, you may see the Rhine Valley, with an occasional glint of the stream, and I hope you think it worth the journey."

He turned off to contemplate the glorious morning sun on the distant hills, and I was so absorbed in the grand vista that it was long before I joined him and thanked him for one of the grandest treats I ever had; and I've been treated many times.

Our horses struck out with vigor past some lakes on the road to St. Blasien, but Capt. Malcolm said that they were good for jack (pike) fishing, but not worth our while. "I like jack fishing," said the representative of Her Majesty's Navy; "it's grand sport when you can't get any better, and I can get plenty of it nearer home with German companions; but I don't capture a fly-fisher every day, nor every year, and I propose to utilize you as long as you will stand it. You are not tired yet, and we will pass these lakes and go on to the trout streams near St. Blasien."

The village of St. Blasien is quaint and picturesque, delightfully situated on the River Alb, in the midst of thickly wooded mountains, and the Hotel et Pension has a good cuisine and good beds, as German beds go, for the Kingdom of Prussia has been described as a "land of tall men and short beds"; but the hotel is usually well filled with travelers, and in such a place one can get blankets instead of the feather covering so dear to the German, but so abominable to many others; the prices were reasonable and the attendance good.

We fished four days with good results; only four fish of our catch weighed over a pound, but what in the name of Izaak Walton does a man want a trout to weigh more than 16oz. for? Give me trout fishing where the fish run just one-quarter of that weight, and I will be happy. In my younger days I preferred woodcock shooting to killing buffalo, and have so recorded my taste,* and I prefer woodcock meat to buffalo meat, and to paraphrase an old saying, it is not all of shooting to shoot. If after a day's fishing or shooting I can't eat my game or fish, I take no interest in killing it.†

But if we did take more trout than the Captain and I could eat, we knew that the invalids, ladies and others at our hostelry would be pleased with a trout sent "with compliments," etc. Verily, a trout well spent is its own reward, and thereby a trout is far and away ahead of another problem, for an unexpected addition to a breakfast party of a few trout brings a return in nods and smiles from fair women and brave men—and here my typewriter breaks down.

I kept no records of this, nor of any other fishing. I hate records as I hate all statistics; they may be useful to scientists, but when I fish I am content with my own work and sport, and if some other fellow has taken a minnow that weighed a hair more than my minnow weighed, it does not disturb me in the least. The

* See "Men I have Fished With," pp. 349-350.

† Here I will again refer to my book, pp. 165-166—where I am disgusted with selling ducks which I have shot, "to be eaten by men who do not thank me for it, do not know me, and may be drunk when they eat them, I wish I had my ducks and he had his money." Of course this is rank egotism, as my companion remarks, but I feel so to-day. If I catch a few more fish than I can use and send them to a friend I expect him not only to enjoy them, but to transmit a vote of thanks, and if he neglects that he is simply listed in this way: Fam.: Porcus; genus *Gamehogibus*; species: *Piscatorialis*; variety: Jim Whatshisname. And Jim is down on my black list.

chances are that he did not enjoy the fishing any more than I did. I wish that there was a death penalty for the man who measures Niagara Falls! There are things which should be sacred to the photographer.

After this digression it is evident that space forbids talking of the fishing in the River Alb, and of other adventures in the black forest; and therefore the editor will call a halt if I don't "sound taps" at St. Blasien.

[TO BE CONTINUED.]

CHICAGO AND THE WEST.

Some Official Correspondence.

CHICAGO, Ill., March 11.—I am in receipt of some correspondence forwarded me through the courtesy of Mr. Nat H. Cohen, President of the Illinois State Fish Commission, which brings up the interesting question of the relation of the game laws of one State to those of another State. Perhaps I can best get at this matter by offering the correspondence in full, beginning with Mr. Cohen's letter to me, which reads as follows:

"A few weeks ago I confiscated two boxes of fish consigned to the American Express Co., of this place. The agent delivered them to two parties here; they notified me and asked me what they should do with them. I informed them they would be liable to prosecution if they offered them for sale, so they delivered them back to the express company, and at my suggestion they turned them over to the Poor Farm, and held J. S. Johnson and G. Schiller, of Green Bay, for the charges. The Chicago fish dealers have notified most of the fishermen of Wisconsin and Michigan that they would not receive fish that were not in accordance with our law, and some of them are using express companies to dispose of their illegal products. Inclosed find correspondence connected with the case."

URBANA, Ill., Feb. 23.—J. S. Johnson, Esq., Green Bay, Wis.—Sir: I have to-day confiscated fish consigned to American Express Co. by you contrary to law, violating Sec. 6 of the fish laws of the State of Illinois, and have notified all wardens in the State to arrest any express agent who offers fish for sale under size. Allowing the head and tail off, not one-quarter that were sent here will come within the limit of Sec. 6. I have notified the Wisconsin Commission of this action. Respectfully,
NAT H. COHEN, Pres. Ill. State Fish Com.

GREEN BAY, Wis., Feb. 24.—Nat H. Cohen, Pres. State Fish Commission: Your favor of 23d inst. to hand and contents noted. In reply will say in regard to chapter 6 of the Illinois State game law this does not apply to any law in our State. We have a right under the Interstate Commerce law to ship into State of Illinois and sell in original package anything that is not contrary to our laws of our State, and shall hold you responsible for any or all you may confiscate in the future. And you will have to pay for these fish you have already taken of me and C. Schiller. Yours respectfully,
J. S. JOHNSON.
C. SCHILLER.

URBANA, Ill., Feb. 25.—J. S. Johnson, Esq., Green Bay, Wis.: Your favor at hand, and in reply will inform you that the State of Illinois enacted a law last general assembly regulating the size of fish that would be illegal to sell or offer for sale. It went into effect July 1, 1897, and it is the intention of this Commission to enforce it at all hazards. A test case has been decided by the Supreme Court regarding birds shipped into the State, and they upheld the decision of the lower courts; and fish come under the same head. The Chicago dealers realized the fact, and have issued circulars to fishermen outside of the State not to ship in fish contrary to law; and I have notified our wardens that, should they find small fish of the species named in our law in the hands of express agents, and they offer them for sale, to prosecute them to the full extent of the law, and if you feel like testing the validity of our law, we are ready to meet you at any time. Respectfully,

NAT H. COHEN, Pres. Ill. State Fish Com.

The question of a right of a State to confiscate game from another State, shipped in violation of local laws, is one that has been taken up in different cases, notably in Ohio. The trend of decisions upholds any State in seizing contraband game, no matter where it came from. We have yet to see this principle fully established in Illinois. Far back in the archives of the sportsmanship of Illinois a case was brought against F. M. Smith, a dealer of this city, for having in his possession several thousand head of prairie chickens out of season. I remember that Col. Bond, at that time king of South Water street, told me that the defense Smith would make would be that about 2,500 of the birds were sharp-tail grouse, and not prairie chickens; also that all the birds were killed legally in the States from which they came. This case languished, after the fashion of many sportsmen's cases, and finally faded away out of sight. We are bound to have the same thing come up again some time, and I hope Mr. Cohen may get a test case here, where the principle involved is practically the same as that in the game cases.

Milwaukee Rod and Reel Club.

There will be organized at Milwaukee, Wis., to-day a body of amateur anglers which will be known as the Rod and Reel Club. Their purpose will be the protection of game fish in Wisconsin, and they will aid all they can in the stopping of seining, spearing and other destructive methods of fishing.

San Francisco Fly-Casting Club.

The San Francisco Fly-Casting Club re-elected its officers on March 1 as follows: President, Walter D. Mansfield; Vice-President, John P. Babcock; Secretary, Horace Smythe; Treasurer, H. Muller; Executive Committee, George C. Edwards, James Turner, F. H. Reed, Willis E. Bacheller and C. G. Young.

The Trout Season.

The greater part of Chicago's trout fishers go north into Wisconsin for their fishing. Already there is talk among some of the enthusiasts about celebrating opening day, April 15, in Wisconsin. Several members of the Chicago Fly-Casting Club have been in the habit of patronizing the Prairie River near Merrill, Wis., a stream which last year gave very good sport. Mr. Edward G. Taylor, of this city, will be on hand on opening day this year, as last, at the Prairie River, near Dudley. The best flies for the Prairie River are reported to me to be the grizzly king, Reuben Wood, coachman, royal coachman and brown hackle, size No. 8 or No. 10.

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

THE FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

The Sportsmen's Exposition.

BOSTON, Mass., March 14.—The New England Sportsmen's Exposition opened in Mechanics' Hall, with a private view given to the members and their friends on Saturday evening. The event was made notable by the participation in it of Gov. Wolcott and staff in full uniform. The attendance of the evening numbered between 8,000 and 10,000.

The show more than realizes the high expectations raised in anticipation of it. It is wonderful in scope, variety and completeness. Such perfect simulation of woods surroundings has never before been seen under roof in Boston, nor in America. Suggestions of the woods confront one at the very entrance. The odor of balsam and pine is so all-pervading, the woodsy smell so all-predominant, that to close one's eyes is to be actually in the wilderness. And in fact to wander about through the Exposition halls with busy eyes wide open is not to dispel the illusion. Everything is of the trail and camp; and the fish, though in tanks; the birds, though in coops, and the deer and moose, though behind Page woven wire, are such striking living pictures of the sportsman's realm that they bring vividly to one's mind the lake and stream, marsh and cover; and so accomplish what is after all the successful end of such an affair as this, the realization of nature and nature's influences.

The live game parks are under the personal charge of Dr. Heber Bishop, than whom in all New England no more enthusiastic and capable director could have been found.

The list of live game mammals shown comprises a pair of antelopes, a pair timber wolves, a pair mountain lions, a wild boar and Great Dane boarhound; a collection of eight North American deer, Rocky Mountain sheep, ewe and ram; a pair of caribou from New Brunswick; Southern deer, "Our Pets," with fawn born Jan. 6, 1898; gray squirrels, pair loup-cerviers, black bear, badger, prairie dogs, elk (twelve females, two males), trio of moose, cage of foxes (two red, one silver), cage of raccoons, wildcats, cage of bears.

The exhibits of live game birds, under the supervision of Mr. O. R. Dickey, are the result of the Association's enterprise extending over many months and reaching to the furthest limits of the continent. They include an extremely interesting series of land and water birds.

There are shown mallard, black, sprigtail and canvas-back ducks and wood duck, American blue-wing and American and European green-wing teal; brant, snow, blue snow, white-fronted and Canada geese; Virginia (Bob White) and California Mountain and valley quail; prairie chickens. Of pheasants there are Mongolian, Chinese, Japanese, Wallachian, golden, English ring-neck, white, silver and Tragopans to be seen.

A comprehensive exhibit of the principal game fish of North America has been rendered possible through the valuable co-operation of the Department of Fish and Fisheries at Washington, and the Maine and New Hampshire State Commissions. The space devoted to this exhibit has a frontage of 175ft., showing a long line of 34 glass tanks, a hatchery tray 24ft. long, and a natural lake 15x8ft. The glass tanks contain 20 varieties of fish of all sizes, from the yearling of about 6in. in length to the 12lb. landlocked salmon. The United States Commission of Fish and Fisheries has furnished for these tanks 100 each Atlantic salmon, Quinnat salmon, steelhead, Swiss Lake and rainbow trout; also a quantity of large and small-mouth black bass, white perch, crappie, green tench, golden tench and golden ides, the three latter for ornamental purposes. These fish are from the Commission stations at Washington and Bucksport, Me., and were transported to Boston by one of the United States Commission cars. The Maine Commission has sent from their station at Auburn some very large fish, including specimens of brook trout of 3, 4, 6 and 8lbs. each; also a pair of rainbow trout from 8 to 10lbs. each, and a pair of landlocked salmon of 10 to 12lbs. each. The New Hampshire Commission has furnished several lake trout weighing from 3 to 4lbs. each, a number of Western whitefish, which are very rare in these waters, also several specimens of Loch-Leven trout ranging from 3 to 4lbs. each—a hybrid Aurcolis.

The hatchery department contains 25,000 young trout fry and 10,000 eggs in process of hatching. The hatching tray is fitted with the latest appliances of supplying the water and the food for these young fishes. The hatchery is in charge of Mr. C. C. Woods, superintendent of the Plymouth Rock Trout Co., of Plymouth, Mass. This department is in charge of Mr. Bayard Thayer, assisted by Mr. Richard O. Harding.

Camp life in its various forms of cabin and tent has had special attention to present it as much as possible in its natural setting, and to present it on as broad a scale as possible. The rough cabins are accurate representations of those in use in the forests where the large game is the object of the hunter's quest, or near the shores of the great lakes when following the teachings of the gentle Izaak. There are the Phillips, Dead River, Moosehead, and Aroostook camps, each typical of its own region, and the total of souvenirs, trophies, photographs of shooting and fishing resorts of the vast game region of Maine and New Brunswick, embellishing the different camps and affording practical information, are well worth the seeing and the studying. Natural trees and shrubbery, set in natural groupings, add much to the wild woods realism of the exhibit, and the theme is further carried out by the aid of the artist's brush. The cabin, representative of the New Brunswick wilderness, and the Florida cabin are extremes of a region which contains varieties of game sufficient for him who loves the rifle, shotgun and reel or all combined. Representative members of the region of each exhibit and famous guides from the different sections, give the visitors all the practical information they may desire.

The Indian village and the camps are among the most "drawing" features of the show; and after the live game comes the display of amateur photographs contributed from all parts of the country and comprising many exquisite gems of outdoor life.

An artificial lake 60x40ft. in area and 7ft. deep has been provided for canoe tugs-of-war, swimming competitions and other aquatic sports.

While the trade displays are ranked as secondary in importance to the other features of the Exposition they demand and are receiving a full share of attention. Among them are exhibits by the Hazard Powder Co., Hunter Arms Co., J. P. Lovell Arms Co., D. Kirkwood, Marlin Fire Arms Co., Page Woven Wire Fence Co., Parker Bros., Peters Cartridge Co., Wm. Read & Sons, Wm. R. Scott, Smith & Wesson, and the United States Cartridge Co.

This brief outline of what is to be seen here is sufficient to demonstrate that the attractions provided supply abundant material for study and entertainment for the full two weeks during which the Exposition doors will remain open.

Black Bass in Lake George.

THE open season for black bass in Lake George was formerly Aug. 1 to Dec. 31. The law was afterward amended to make the season for those waters uniform with that of the State at large, June 15 to Dec. 31. A bill has been introduced by Assemblyman Eldredge this session to restore the old dates; and the merits of the question are well set forth in the following correspondence:

HON. TAYLOR J. ELDRIDGE, Assembly Chamber, Albany, N. Y.—Learning that there is some opposition to the Lake George bass bill, which you introduced, I desire to give you some information in regard to previous legislation, history of the bass in the lake, etc.

Lake George is one of the few lakes in the State that originally contained black bass. It was fished for years during the breeding season of the fish until the bass fishing became very poor. Something over fifteen years ago the people realized that something must be done to preserve the black bass, and a special law was enacted to extend the close season for black bass in this lake until July 10. This was found not to cover the breeding season of the bass, and the close season was extended to July 20; and this too failed of its purpose. About twelve years ago a law was passed to open the fishing in Lake George for black bass Aug. 1. It was absolutely necessary to enact this law to preserve the fish, and that was the law in force until amended last year.

The habits of black bass are entirely different from any other of our so-called game or food fishes. They cannot be hatched artificially like shad, trout, whitefish, pike-perch, etc., and they will not spawn naturally until the temperature of the water approximates 65 degrees Fahrenheit for a good portion of the day.

After they have spawned they watch over the brood of young fish for from ten days to three weeks. Lake George is made up almost wholly of spring water, and the spring water is cold throughout the summer months. I kept a record of the temperature of Lake George one summer, and the highest point reached at the surface was 74 degrees. In order to preserve the bass fishing in Lake George the bass that are now in the lake must be protected during the spawning and breeding seasons. As a matter of fact, the bass spawn all through the month of July, and in one instance I have seen bass on the spawning beds as late as Aug. 25.

This law is demanded not in the interest of summer boarders or any other visitors to the lake, but in the interest of the preservation of the fish alone. If the fish are exterminated by fishing for black bass during the spawning season the supply can be made good only by taking adult fish from other State waters and planting them in Lake George. There is objection to this always by the people interested in the waters from which the bass are taken. And therefore I ask you to urge the passage of your bill as the only means of preserving black bass in Lake George. Yours respectfully,

A. N. CHENEY, State Fishculturist.

In the Senate Mr. Hutton, in opposition to the measure, said: "Now, in order to be posted as regards the spawning season of black bass, I have here a letter from DeWitt Clinton, who is librarian of the Young Men's Association Library of the city of Troy—a very complete library. He takes for his authority Charles Hallock, the editor of the Sportsman, and ex-editor of the FOREST AND STREAM:

"Friend Will.—In answer to your favor, I reply: Black bass begin to spawn in Lake George the middle of May. About a month previous to the spawning season they pair, and leave the deep, still water where they have spent the winter, and go to the shallow water of 18in. or 2ft. deep; the nest is then made [confusion in the House and Mr. Hutton's voice indistinct], and the female lays eggs, which are hatched in eight or ten days; the female remains to guard them during all the time."

"Now, gentlemen, there is the authority, as Mr. DeWitt Clinton tells me, of one of the best authorities in the State on fish."

In comment upon which Mr. Cheney wrote as follows:

HON. HOBART KRUM, Senate Chamber.—Having read the letter written by Mr. DeWitt Clinton to Mr. Hutton, and quoted by him on the floor of the House, I am obliged to say that Mr. Clinton is incorrect in giving the beginning of the spawning season for black bass in Lake George as May. Nor does Mr. Hallock, whom he purports to quote from, say so. Mr. Clinton takes his information from Hallock's Gazetteer and Guide, published twenty years ago. See page 277. What Hallock does say is that "Black bass begin to spawn about the middle of May." The language of the letter is all Mr. Hallock's except "Lake George," which was inserted by Mr. Clinton. The only reference to the bass of Lake George in the Gazetteer is on the same page, and I wrote it, and it does not refer to the spawning season. Mr. Hallock knew nothing about the fish in Lake George from personal knowledge, and when his book was printed little was known about black bass by any one. If Mr. Clinton had desired the whole truth he had only to turn to "The Book of the Black Bass," in his library, and under "Spawning Habits" Dr. Henshall, the author, says: "The period of spawning extends from early spring to midsummer, according to the section of the country and temperature of the water—in the Southern States occurring as early as March, and in the Northern States from the middle of May to the middle of July. Always earlier in shallow water and later in

deep water. In one county in Wisconsin I have observed a difference from one to four weeks in the time of spawning in the numerous lakes, owing to a difference in temperature."

My letter to Mr. Eldridge will give the facts as to the habits of black bass in Lake George. It was discovered only a few years ago that black bass would not spawn until the temperature of the water reached about 65 degrees, and it is not yet mentioned in the textbooks. Yours respectfully,

A. N. CHENEY, State Fishculturist.

Florida West Coast Fishing.

FORT MEYERS, Fla., March 5.—The Merrill brothers, Richard and Fred, of Milwaukee, have arrived from up the Caloosahatchee, where they had gone for a day's duck shooting. One of the hotel porters was sent down on the dock with a hand cart to bring up the game, and when he returned the cart was filled with a pyramid of ducks. The brothers had gone for flight shooting and had located themselves in a blind between two popular feeding grounds, securing 110 birds during the day. On their return down the river they saw thirteen alligators.

The following evening Mr. Charles A. Dean, of Boston, arrived from the upper Caloosahatchee with several deer and an immense wild gobbler, whose coat was like burnished bronze. Mr. Dean is an old time visitor here, and he is an enthusiastic sportsman.

A few days before my arrival here Miss O'Neill, of New York, caught a large tarpon, of which she was justly proud. She was down with a party headed by her father, Mr. Hugh O'Neill, and had been fishing persistently, but like many others she appeared to have no luck in that line. Some persons fish an entire season without securing a fish, and Miss O'Neill was beginning to fear that such was to be her fate.

J. R. Valentine, of New York; J. Fallert, B. Fallert, J. Straub and Mr. Webber, of Brooklyn, have been enjoying the tarpon fishing at Captive Pass. Mr. Valentine caught two fine specimens, and it is understood that each of the other gentlemen caught one apiece. At all events there were six captured by the party. This place is between Punta Rassa and Punta Gorda. It is simply an inlet, and the only place of abode there is a house boat which affords ample accommodation for the sportsman. Previous to this season this convenience was not there, but the pass was just as popular because the sport was to be found there, and the angler was content with a tent or a shack of any kind.

At Punta Gorda there are a number of anglers, most of them old-timers, who are now enjoying excellent sport. The clipper schooner yacht *Whim*, belonging to Mrs. A. M. MacGregor, of New York, has a merry party on board who are plying the rod in the waters of San Carlos Bay and its immediate vicinity.

The auxiliary yawl-rigged yacht *Tarpon*, the property of Mrs. Geo. F. Staggs, of Louisville, Ky., is riding peacefully at anchor in a bight at Captive Pass, while her party are finding all kinds of fishing and shooting on Captive Key.

The schooner yacht *Armada* with a party of Bostonians on board, headed by Mr. George Mixter, and Chester W. Chapin's (New York) new sloop yacht the *Sappho*, are both at Punta Gorda.

The large schooner-rigged steam yacht *Penelope* left Port Tampa to-day for a six weeks' cruise along the northern coast of South America and an exploring trip up the Orinoco River. The party on board of her consisted of Mr. and Mrs. John Shephard; Mr. and Mrs. B. W. Currier, of Boston; Mr. and Mrs. S. B. Raeder, Miss Raeder, Landon Raeder, J. Trowbridge Bailey and Dr. Kellogg, of New York, and John Ashe Hayward, of Charleston, S. C. FOREST WATERS.

Green Turtles of Florida.

PASADENA, Cal., Feb. 24.—*Editor Forest and Stream:* I note in the last issue of FOREST AND STREAM an interesting paper by Mr. R. M. Monroe on the green turtles, in which he states that there is some doubt as to where the females of the Gulf Coast deposit their eggs. While some of the Florida turtles may cross the stream to nest, a very easy matter for the fast-swimming animals, I venture the belief that most of the turtles with which Mr. Monroe is familiar nest on the outer keys of the Florida Reef; at least numbers did from 1860 to 1866, during my time on the reef, and as those islands have been less frequented since the war, in all probability the nesting turtles have not decreased in numbers. 1866, during my time on the reef; and as those islands

During these years I took scores of loggerhead and green turtles, turning them as they were laying, or after the process. Green turtles were particularly fond of the east and middle keys of the Tortugas group, while the loggerheads seemed to have an especial fondness for Loggerhead Key. We took them on the beach in May and June, and they may have migrated down the coast for that purpose.

The suggestion of Mr. Monroe that they could be raised artificially is well made, and it can be done. I have often dug up turtle eggs and "replanted" them in the sand to observe the hatching process. The young came out, and were kept within a fence which was built out into the water. On a large scale this might be carried on to advantage, and many turtles saved, as the majority of every brood is eaten by gulls or predatory fish. C. F. HOLDER.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

FOR SALE.—Hunting and fishing preserve in Adirondacks. 12,000 acres forest land; several fine lakes, 15 miles trout streams. Deer in plenty. 14 miles from railroad. A. A. Leonard, Knickerbocker Athletic Club, New York.

The Kennel.

Hydrophobia.

Editor Forest and Stream:

I take Mr. J. J. Meyrick (vide yours March 12, page 213) to be a professional, and therefore do not venture to dissent from his expressions on hydrophobia; but there is one point on which I am about certain that he is mistaken. He quotes Gen. Dodge as authority for the statement that bites of skunks cause rabies in the Arkansas Valley, but not to the north or south of that locality!

Now I have never seen Gen. Dodge's work in which this statement was made, but I did investigate the statistics of "skunk rabies" very thoroughly some years since, and must strain my modesty enough to think that the published results of my investigation very seriously damaged that myth that the bite of a skunk always produces rabies.

The truth as to that yarn seems to be that the investigations and reports of Dr. John H. Janeway, a surgeon in the United States Army, have been most wonderfully twisted and misunderstood, and on what it is supposed Dr. Janeway has stated as his observation this myth has been founded. Now the real truth is that in—or about—1871 Dr. Janeway, who was stationed at Fort Hays, Kan., reported on prevalence of rabies caused by skunk bites, and so far from supporting the idea that skunks could convey the disease by their bite, irrespective of their being rabid themselves, he distinctly combats this delusion. He cites cases of hydrophobia in man resulting from bites of skunks, dogs, wolves, and even hogs! He admits that the bites of rabid skunks produce more cases of hydrophobia than bites of other animals, but very satisfactorily accounts for this by the skunk being nocturnal, and thus bites sleepers in exposed portions of their bodies, while the wolves and dogs sometimes bite through the clothing, and thus the virus was not introduced into their systems. In fact, he cites one instance of one man, bitten in the hand, dying of hydrophobia, and another bitten on the leg escaping, the same rabid animal (wolf, I think) inflicting both bites, one directly after the other. Dr. Janeway makes it quite clear that the outbreak of rabies he reported on was epidemical, as no cases were known previous to a certain year; and in a private letter to me he says that very few cases appeared in the year following that on which he reported, and none the year after that; and that skunks were very rare in that district for some years after; he also says that the disease first appeared in the northern tier of Texas counties, and thence spread to the Fort Hays Reservation. That skunks may contract rabies, and that while rabid their bites can communicate the disease, seems quite comprehensible, but that the bites of non-rabid skunks can convey the disease is beyond swallowing by any old coon or fox hunter like myself, who has known dogs skunk-bitten by the dozens, and never saw a case of rabies.

I feel sure that this skunk-rabies delusion has arisen from total misconception of Dr. Janeway's reports, as every person supporting the idea refers to Dr. Janeway as the authority for it, and great is Dr. Janeway's disgust at being so erroneously quoted. The vitality and persistence of this skunk-rabies humbug is most exasperating. A year or two since, our daily papers all over the country had accounts of a man in St. Augustine, Fla., becoming rabid from the bite of a skunk, running amuck all over the country, biting people, and the Sheriff sending out a posse to shoot the rabid man on sight. Names of all parties were given, and I wrote Sheriff Perry, and he replied that the party named as the rabid runner amuck was alive and well; that he saw him almost every day; and that he (the Sheriff) had never sent out a posse to shoot anybody, sane or rabid!

As to that matter of saliva conveying rabies, may I suggest to Mr. Meyrick that perhaps rabies is not the disease conveyed? I take it that it cannot be doubted that saliva may convey blood poisoning, as Major Blair D. Taylor, Surgeon, U. S. A., long stationed in northern Texas, in his kind reply to my inquiry if he had ever known of a case of skunk rabies, in addition to his statement that he had never seen or known of a case, added that the present Surgeon-General, U. S. A., had demonstrated by experiment that saliva—even that of mankind—could, and did, convey blood poisoning. In my investigations of reported cases of skunk rabies I came across such instances as a man skunk-bitten showing symptoms of rabies, but recovering after copious blood-letting! And another man who went into a slow decline dying eight months after the bite! Major Taylor says that blood poisoning would account for such cases, but as the layman understands rabies, neither of these was a case of that disease.

Presuming that Mr. Meyrick would be interested in reading just exactly what Dr. Janeway did report on skunk rabies, I would say that I sent a copy of the Medical Record, of New York, containing said report, to my friend Dr. J. Sidney Turner, 81 Anerley road, London, S. E., and I have no doubt that Dr. Turner preserved the paper and will be glad to show it to Mr. Meyrick.

I should have said above, that in addition to the statements of many medical men in the supposed "skunk rabies" district who had never seen nor heard of such a case, the late Prof. E. D. Cope wrote me that he was located a few hundred miles west of Fort Hays during the years in which Dr. Janeway made his observations, and that he had never heard of any rabies, skunk or any other kind, while there. You, Mr. Editor, know the value of Prof. Cope's testimony on any such matter. Yours truly,

W. WADE.

OAKMONT, Pa., March 10.

A Good Retriever.

THE Edinburgh Scotsman relates that a gentleman who was recently out shooting at Long Milford in Suffolk tells how he was standing under a fence when he saw a partridge flying straight to the fence, and he was about to fire, when it dropped into the ditch opposite where he was standing.

He immediately sent his retriever after it, and having got about 100yds. down the ditch the dog returned with some feathers in his mouth. He sent the dog into the ditch again, telling him to fetch it, and to his surprise the dog returned bringing by the spout an old tea kettle minus the handle, and with the French partridge inside, its head just peeping out.

No doubt the bird ran into the tea kettle for safety, and the dog tried his utmost to get it out the first time, but owing to the small aperture was unable to get his nose in; on being sent back a second time he thought it best to bring the lot rather than disappoint his master. This was witnessed by several gentlemen of the party, and the bird had not been shot or wounded in any way.

American Spaniel Club.

THE annual meeting of the American Spaniel Club was held on Feb. 22, in Madison Square Garden, New York. Present, Messrs. H. K. Bloodgood, S. J. Bradbury, George Douglas, R. P. Keasbey, F. W. Kitchell, Andrew Laidlaw, H. R. Mullens, E. M. Oldham, W. T. Payne, George R. Preston, Jr., Jesse Riggs, Mrs. F. Smyth, Marcel A. Viti, D. E. Waters, James Watson, A. C. Wilmerding.

Certain changes and amendments to the constitution and by-laws were made, and the following executive committee elected: R. P. Keasbey, S. J. Bradbury, Marcel A. Viti, H. K. Bloodgood, George Greer, W. T. Payne and A. C. Wilmerding.

At a meeting of the executive committee it was decided to open the following sweepstakes, to be judged at the Westminster Kennel Club's Show of 1899:

Clumber Spaniel Sweepstakes, for clumber spaniels whelped since July 1, 1897, and never shown prior to Jan. 1, 1899; Irish Water Spaniel Sweepstakes, for Irish water spaniels whelped since July 1, 1897, and never shown prior to Jan. 1, 1899; Field Spaniel Sweepstakes, for field spaniels whelped since July 1, 1897, and never shown prior to Jan. 1, 1899; Cocker Spaniel Sweepstakes No. 1, for solid color cocker spaniels whelped since July 1, 1897, and never shown prior to Jan. 1, 1899; Cocker Spaniel Sweepstakes No. 2, for parti-color cocker spaniels whelped since July 1, 1897, and never shown prior to Jan. 1, 1899. Conditions of entry: Nominations made on or before July 1, 1898, to be accompanied by \$1 entry fee; nominations not made by July 1, but made on or before Sept. 1, to be accompanied by \$2 entry fee; nominations not made by Sept. 1, but made on or before Nov. 1, to be accompanied by \$3 entry fee; no nominations will be received after Nov. 1, 1898.

A final fee of \$3 is to be paid upon all entries on or before Jan. 1, 1899. Any nominations on which the final fee is not paid by Jan. 1, 1899, will be forfeited to the stake.

An amount equal to at least 50 per cent. of the entry fees in each stake will be added thereto. All stakes are to be awarded as follows: First prize 40, second 30, third 20, fourth 10 per cent. of the stake.

If less than four dogs are shown in any stake, the whole amount of the stake is to be paid to such entries in the above ratio.

It was also decided to open the following produce stakes: Futurity Stakes, for spaniels over 28lbs.; Futurity Stakes, for cocker spaniels. Conditions of entry in Futurity Stakes: All bitches whose produce is desired entered in this stake must be nominated before being due to whelp. Payment to be as follows: Immediately after whelping a payment of 25 cents to be made upon each puppy in the litter. At the age of three months an additional payment of 25 cents to be made upon each puppy desired to be retained in stakes. A final fee of \$3 is to be made on all entries on or before Jan. 1, 1899. Any nomination upon which the final fee is not paid by Jan. 1, 1899, will be forfeited to the stake.

All stakes to be awarded as follows:

First prize 40, second 30, third 20, fourth 10 per cent. of stake. If less than four dogs are shown in any stake, the whole amount of the stake is to be paid to such entries in the above ratio. A club tankard to be given to the winner of each futurity stake.

Three challenge prizes were presented to the club: Mepal Challenge Trophy, for best cocker spaniel, presented by H. K. Bloodgood, Esq.; Saybrook Cocker Trophy, for best cocker any solid color other than black, presented by R. P. Keasbey, Esq.; the Breeders' Trophy, for best field spaniel bred by exhibitor, presented by Marcel A. Viti, Esq. Conditions governing nominations can be obtained of the secretary.

National Produce Stake.

NEW YORK, March 7.—Through a clerical error in the minutes of the meeting of the club recently formed to run the National Produce Stake, the title of the organization was given as National Field Trial Club. I will say that this title was talked over, but finally rejected, owing to its conflict with a former club of that name, now defunct. The name of the organization is National Produce Stake Association.

CHAS. H. PHELPS, JR., Sec'y-Treas.

POINTS AND FLUSHES.

In our advertising columns will be found an offer of \$25 reward, by Mr. James Mortimer, for the return of the black cocker spaniel bitch Simcoe Rose, which was either misst or taken from the late show of the Westminster Kennel Club.

The premium list of the first annual dog show of the Western Pennsylvania Kennel Club, to be held in Oil City Hall, Pittsburg, Pa., April 6 to 9, is now ready for distribution, and can be obtained of Mr. F. S. Stedman, Lewis building, Pittsburg.

Kennel Notes.

Yachting.

THE annual meeting of the Yacht Racing Association of Long Island Sound will be held on Monday, March 21, at 8 P. M., at the Fifth Avenue Hotel, New York. More or less business of importance to the Association as a body and also to the clubs individually must come before the meeting; and it is most desirable that there shall be a full attendance of delegates. Each club owes it to itself that it is fully represented, both to protect its interests and to demonstrate that it appreciates its position as a member of the Association; and it also has other duties to the Association in carrying out the general business to the best interests of all. It rests with the executive of each club to make certain that all of the club delegates or their proper proxies will be present at the meeting and prepared to take part in the general discussion of amendments, etc.

The Boston Globe quotes at length from the letters of Messrs. Froude and Watson in Mr. Jarvis' report, and comments on them as follows:

With such testimony against two ideas which are pet American ones just at present—no tax on sail area and no restrictions on centerboards, the latter being a necessity here—the adoption of the complicated British Y. R. A. rule is not likely. The Y. R. A. of M. is likely to give the most satisfactory rule for boats under 30ft. waterline, provided it keeps up its present progressive policy, and the experience of next season should help wonderfully toward that end.

It is a matter of course in this country at least, whatever the popular will may be in England, that no discrimination shall be made between the keel and centerboard types in the rule of measurement, but that both shall be placed as nearly as possible on an equality. This may not be an easy matter in practice, whatever formula be adopted, but it would be no more difficult in connection with the Y. R. A. rule than with many other proposed rules in which an effort is made to secure a fuller body.

We are not yet aware that the idea of untaxed sail is by any means so generally favored as the Globe indicates; in fact, it is Boston rather than America. As far as Mr. Froude's opinion is concerned, it relates solely to a rule in which several hull dimensions are included as factors; this, with a crew limit, of itself putting an indirect but most effective tax on sail. We have no idea that Mr. Froude would advocate a rule in which l.w.l. length was the sole factor.

The point of the Boston position, first and last, lies in the final sentence above quoted from the Globe. Boston is concerned simply and solely with racing yachts of 30ft. l.w.l. and under, and is satisfied with a rule which produces such boats. It has no interest in larger yachts, and they are never considered in the discussion of the measurement question.

Up to the past season local conditions and various accidental causes have operated to preserve a fairly good type of boat about Boston, in spite of some extreme racing machines of excessive sail area; and though we have no doubt that the development of the next two years under the l.w.l. rule will show very different results, we are willing for the sake of argument to accept the Globe's statement that the rule is satisfactory for (racing) yachts under 30ft. l.w.l. This, however, has very little bearing on the question now prominently before American yachtsmen, of a new measurement rule that will give a fair fighting chance, if not positive preference, to yachts of moderate draft and sail area, and of such fullness of body as will give accommodation in proportion to size. The one rule that will probably come further than any other from this end in producing yachts of excessive beam and draft, enormous sail plans, and most limited accommodation, is that of l.w.l. length alone.

Gilberts Bar Y. C.

WAVELAND, Fla., March 9.—The Gilberts Bar Y. C. held their usual monthly meeting and regatta Saturday, March 5. There was a stiff breeze from the northeast. In the first class there were three entries; in the second class only one. Times of racers as follows:

	First Class.	Actual.	Corrected.
Albatross	0 40 59	0 40 59	0 40 59
Britannia	0 40 30	0 40 30	0 39 14
Penguin	0 43 17	0 43 17	0 42 26
Winner, Britannia.			
	Second Class.		
Swallow	0 41 35		
Commodore, H. E. Sewall, Sewall's Point, Fla.; Secretary, Paul M. Aston, Waveland, Fla.			

Sound Y. R. A.

A MEETING of the executive committee of the Sound Y. R. A., preliminary to the annual meeting of the Association on March 21, was held on March 7, at the Seawanhaka C. Y. C. house. The question of the immediate abolition of time allowance, referred to the committee at the fall meeting, was carefully discussed, the decision being that such action was not desirable at the present time, as there are strong hopes of the adoption of a new rule by next year, in which event some re-classification will be necessary. The subject of dates for 1898 was discussed and some few changes suggested, the main schedule being the same, as most of the clubs retain the same dates from year to year. The committee also discussed the subject of starting signals, referred to it at the fall meeting, several more signals being necessitated by the separate starts for the special classes. The Sachem's Head Y. C. applied for membership and was admitted.

North American Y. R. U.

THE newly formed Inland Lake Y. R. A. has applied for membership in the North America Y. R. U., also the Royal St. Lawrence Y. C., the Rhode Island Y. C., and the Newport Y. R. A. The Larchmont Y. C. at its recent annual meeting resolved to join the Union.

Y. R. A. of Massachusetts.

SEC'Y BLISS has sent out a long list of proposed amendments to the by-laws and racing rules of the Y. R. A. of Massachusetts, which will be acted on at the meeting on Thursday, March 17, at 7:30 P. M., at Young's Hotel, Boston.

Memories of Boating Days.

ABOUT twelve years ago my brother and I conceived the idea of building a boat. At the start it was to be a rowboat, but we invited two friends to join us in our grand project. Our ideas enlarged with our increase in numbers, and within a week nothing but a sail boat could be considered. We made a model. (Our father had taught us some of the mysteries of model making and getting the lines therefrom.) When this task was completed we found we had developed a craft of the following dimensions: 22ft. over all, 19ft. waterline, 6ft. beam, and an estimated draft of about 18in. As she was to be a centerboard sloop, the reader will observe that our knowledge of the required width for such a boat was remarkably deficient; and but for the fact that our creation, seemingly aware of this fact, expanded herself during the process of construction, an extremely cranky ship would have been the result of our labors.

It happened in this way: Our frames were made of oak, which we, with the aid of hot water and steam, bent as near as possible to the required shape. As we put them in place battens were nailed across from one side to the other. When we had secured the gunwales to the frame the battens were removed.

The next morning our boat, instead of being 6ft. wide, was 7ft. 2in.—a fact which we bewailed a great deal at the time, but since have had cause to be very thankful for.

Our father, who up to this time had taken little stock in our enterprise, came over to the shop one evening, and seeing the bad weather we were making of it, was considerably amused. However, while he would not admit openly that we had done fairly well for amateurs,

and as soon as she was finished I engaged through a friend a man to haul her to the river. He arrived one afternoon about 5 o'clock. The house in which I lived was next to a vacant lot, and all I had to do was knock off a few boards from the yard fence and the truck could back right up and receive its burden. In less than ten minutes after the opening had been made it seemed as though the whole population of the ward had assembled in that lot to view the wonderful sight of a little sail boat emerging from a back yard.

I was disappointed with the appearance of the man

Birthplace of Monaitpee.

who came to take her away. He did not seem to take the interest I would have liked to see him take in the job. In fact it did not seem as though he knew whether he came to remove a boat or cart away the boards I had battered off the fence. He appeared to have an aversion for young people, for when some small boys made audible remarks about his abstracted air he suddenly charged on them, and a general stampede followed, and for five minutes the wildest confusion reigned in the lot, in the midst of which could occasionally be seen the bald head of a half drunken Irishman surrounded by a howling mob of urchins. Before he got back I had with the assistance of friends got the boat on to the truck and made her as secure as possible with the limited supply of lines which the driver had brought. He finally came staggering toward us, puffing and blowing like a porpoise, and vowing vengeance. Seeing all was ready he climbed up, and seating himself astraddle of the bow, which was toward the horse, he jerked the reins and gave the nag a clip with the whip. Away he went over the uneven ground and across the curb into the street.

As the forward wheels dropped the boat slid forward and struck the animal. Away he went on a gallop down the steep incline toward Fourth avenue, while the driver yelled like a Comanche Indian. In less than a minute he had reached the cross street and was apparently going straight across into a hallway on the opposite side.

My heart almost stopped beating. I could plainly see all my hopes and the beautiful result of my long hard winter's toil being dashed to pieces, and scattered broadcast in a miserable hallway. I cannot express the anguish I felt at that moment. I stood transfixed with horror, while the youngsters about yelled and screamed with fiendish delight.

By some miraculous intervention of Providence or a lucky pull of the rein the horse suddenly turned sharply to the left, and the outfit fetched up against a lamp-post, the traces parted, and away went the plug through Fourth avenue. The driver was shot from his seat and landed about 10ft. in front of the turnout in a heap. Well, the animal was caught a couple of blocks away and brought back trembling with fright. The driver pulled himself together, somewhat soberer, and after a good deal of trouble got the horse hitched up again. But the nag was so nervous that when he chirped to him he gave such a leap that he again broke the traces.

Before we got the boat to the river the harness was a total wreck, and the steed had run away twice. The

driver insisted in stopping at every corner to have a drink, and was so drunk when we arrived at our destination that he only charged half the price he had originally named, saying that he had had the worth of the other half in fun. The strangest part of it all was that the boat was not even scratched, and in this respect fared much better than Monaitpee did on her journey to the sea.

Well, in due time she was rigged up and launched forth into her future element. Our first trip was from Poillon's old shipyard, foot of Bridge street, Brooklyn, to Sheepshead Bay. And our skill in handling a new and untried boat was put to the test in rounding Coney Island on this occasion. It came on to blow from S.E. and caused us to double reef in Gravesend Bay. Once outside the Island the storm commenced to have fun with us. Monaitpee was swept by one wave after another until we were all drenched to the skin. The anchor, which was swung under the bowsprit, got adrift, and in trying to secure it I was submerged by a heavy sea, lost my cap, and had my watch filled with salt water. Still we plowed along beautifully, and in a very short while had passed the iron pier.

One of our crew had confined himself to the cabin as soon as we struck rough water to avoid getting his new suit wet. Presently he inquired if it was getting any smoother. We told him it was like a mill pond. He cautiously emerged from below, and just as he was stretching himself a vicious comber landed against her weather bow, and he got the result of it full on the broad of his back. He beat a hasty retreat. Misery likes company, and the rest of us who were so wet we could not get any wetter howled merrily at his discomfort. However, the worst part of the trip was now

"Away He went on a Gallop."

over, and slacking sheets we eased away a point or two, and soon had dry bar to windward.

Monaitpee now sprang away, leaving a seething streak of suds behind her. Fifteen minutes and we had reached Point Breeze. We passed through the Inlet and on up to our destination at the upper end of the Bay, about a mile further on, where we anchored off the village of Sheepshead Bay.

Our first sail had shown us that our boat could be improved by adding more ballast, which we did at the first opportunity. Monaitpee turned out to be a very good boat, although not so stiff as some of the broad-beamed craft on this side of Long Island. The owners of these boats sometimes shook their heads ominously as she went tearing down the Bay and across to Sandy Hook in most all kinds of weather, heeling to an angle of from 40 to 45 degrees.

"We Plowed along Beautifully."

In these days fishing was our hobby, and we frequently visited the locality of the Roamer Beacon or Monument, as it is familiarly spoken of. Small sea bass and black fish were quite plentiful about the rocks which lay on the bottom near this light. Time and again we drove her across the Roamer Shoals when none but the reckless and thoughtless boys we were would have dreamed of doing so except for very urgent reasons. Returning from these trips we always landed at Point Breeze, which is the extreme eastern end of Coney Island or Manhattan Beach.

In 1886 there were two buildings situated here. One was the ruins of the old Point Breeze Hotel, which I believe had been a financial failure, had been deserted and left to the mercy of wind and weather, or any beach comber who happened to be prowling about and in need of lumber. There were a number of rooms which were yet secure from storms, and I recollect one time we all spent a night in one of them just for a lark.

A ghostly procession we must have appeared to any one could he have seen us, as each with a bundle of salt hay under one arm we marched up the rickety steps, carrying in the right hand, held high above our heads, each a soda water bottle with a lighted candle stuck in

"We Made a Model."

he nevertheless turned to and gave us some valuable assistance, such as lining out planks and helping us put them on her.

When this feat was accomplished, we had quite a formidable looking vessel, so we concluded we would put a cabin on her.

Three months' time (we only labored evenings, being engaged during the daytime in earning our living and the money with which to purchase the materials for our craft) was consumed in building the hull and cabin. I don't think four prouder or happier young fellows ever existed than were we the day that Monaitpee was snaked out of the old blacksmith shop on a mammoth boat truck drawn by two large horses.

But what tortures we suffered as we were forced to see our hearts' delight go rumbling and bumping over two miles of uneven city streets. We wondered if there would be any putty left in the seams, or any paint on her beautiful sides, which were receiving a tremendous amount of rubbing and chafing by the lines and cradles which held her on the wheels.

And yet the agony as far as myself was concerned was insignificant compared with what I endured some five years later, when, having severed my connection with the Monaitpee, I built in my back yard an 18ft. catboat,

its neck, so that we could pick our way across the broken floor. On to the main stairway and up we filed to the sleeping apartments, where deathly silence reigned—no sound save the creaking of the boards beneath our feet, and the mournful moaning of the wind and the booming of the surf on the beach. Selecting a room which was in fairly good condition and contained a window facing the ocean, we threw our hay on the floor and proceeded to arrange our beds. When this was done we sat for a long time talking and smoking. No one seemed very sleepy. The most horrible hair-raising ghost stories we could remember or invent were told, but finally one after another succumbed to the requirements of nature, and the candles burnt low, went out, and we slept until a stream of sunlight, finding its way through the dusty window panes next morning, awoke us to the fact that we had for one night been the guests of a hotel without a host.

The other building was about 200 yds. or so to the northeast and usually went by the name of the Boat House. It was some 30 ft. square, with a veranda all around it, and was all one room inside, clear up to the roof. We often used this place to shelter us from a sudden shower, and occasionally, when having a party of young people down, it was utilized as a ball room. Sometimes for the want of more interesting diversion, the snipe being scarce, the building was used as a target; bullseyes were chalked on its sides and filled with shot. It was frequently remarked that if ever the wind blew the house into the Inlet it would sink at once with the weight of lead its board walls contained. I know several people who have tender memories regarding this old shanty, where many idle hours were whiled away, lounging about on its broad piazza, where one could recline in the warm sunshine or in the cool shade, simply moving about from one side of the house to the other. If my memory is not at fault it finally went to make some one a barn, and to-day the only

"They Came Wending Their Way Down the Channel."

house east of the Oriental Hotel except a few small outbuildings near by is the Life Saving Station.

Just across the bay lies Plum Island. At the time of which I speak there were two shanties on it. One of them was a small affair with a peaked roof and covered all over with black tarred paper, and presented a dismal appearance, which was rendered possibly more so by the inscription on a board nailed to the door, which read: "Mrs. Bugaboo." The other place was a relic of former times, and the same one I had reason to mention in an article which appeared in the *FOREST AND STREAM* some years ago under the title of "A First Experience at Boat Sailing." It was known to us as the Clam Chowder Hotel on account of the fact that we often landed here for the purpose of preparing that savory concoction. And these two buildings were the only signs of civilization about. To get "out of the world" all one had to do was to visit Plum Island. How different it appears to-day—but I may describe the changes that have taken place later on.

Many a peaceful night was spent on board our little yacht anchored close to the beach of this island. Often about 8 or 9 o'clock, casting off our moorings, we would quietly slip down on the high water slack, no wind nor moon, and as we drift slowly along, the main sheet trailing in the water and collecting stray grass and drift, we have lolled carelessly about the cockpit, and felt that if there was any peace on earth we had found it. A faint light appears ahead, and presently a belated "party boat" looms like a black shadow out of the darkness. All is still on board of her, and only the tramp, tramp of her crew, as they walk from one end to the other, laboriously pushing her along with a long pole, can be heard. A quack flies overhead, sending forth his harsh notes. He cannot be seen, but we know his voice.

Suddenly another sound comes to our ears. It is a human one, and we recognize the voice of "the Spaniard." He is warbling some love song in his own tongue, and it is inexpressibly weird—a monotonous sing-song tune, gradually rising higher and higher until it reaches the limits of his lungs, and sounds like the last despairing shriek of some one in awful torture, then dying away until he can scarcely be heard. He sounds as though holding a quiet little conversation with himself. We smile, for we know that "the Spaniard" is stretched out in his little boat, which he calls the Bluefish, and is waiting for a breeze to fan him homeward.

We arrive off the beach of Plum Island. The anchor splashes, and the boat swings around obedient to the current. The sails rattle down and are furled. The

bunks are then prepared for our reception, but not because we are in any hurry to retire. We want to have the job off our minds, so that we can lounge about deck or stretch out at length on the cabin top to puff and chat or listen to the sounds of night. The moon rises, and soaring upward sends a rippling streak of silver flashing across the water toward us. The surroundings become visible, the two shanties on Plum Island stand forth, and the Inlet sparkles, as its waters flow around Point Breeze, where the Boat House and the old hotel sit in gloomy grandeur.

For hours we drink in the glories of this beautiful night, until some one nods or yawns, and we remember that our beds are still empty. The next morning breakfast is eaten on the ground in front of the Clam Chowder Hotel in the open air. When again on board we can just discern that some of the boats at the village are getting under way, as one after another their white sails are spread to the fresh morning breeze. Soon they come, wending their way down the channel, until a long procession is formed, and one is reminded of a flock of sea gulls starting on their daily flight. Before the leader of the fleet is up to us we are off and speeding away, and Monaitipee is the first boat to pass out of the Inlet.

A. M. LOCKHART.

[TO BE CONTINUED.]

The Y. R. A. Measurement Rule.

THE various changes of recent years in the rules of the Yacht Racing Association of Great Britain have been fully recorded in the *FOREST AND STREAM*, and our readers are aware that, after rejecting the old tonnage rule in a modified form in 1886 and adopting the "Rating Rule," properly so called, of

$$\frac{L \times S. A.}{6,000}$$

this latter rule was in turn abandoned at the end of 1895. In its early years it produced most excellent craft, as instanced by *Yarana*, *Varuna*, *Mohawk*, *Deerhound*, the series of three *Dragons*, *Decima*, and many other craft still doing good work as fast cruisers and serviceable yachts. Up to 1892 there was little to be said against the type of yacht produced by designers under the rule, but from that time onward the influence of the bulb fin

Fig. 3.

was plainly visible in the increased speed and marked deterioration in all other qualities. A movement for the alteration of the rule was made in 1892, but after an exhaustive examination of the subject by the Council of the Y. R. A., aided by all the designers, it was abandoned. Three years later it was taken up again, with the result that after another very thorough course of investigation the present rule was adopted.

This rule is based on a purely arbitrary unit termed "Lineal Rating," expressed nominally in feet, the formula being:

$$\frac{L + B + .75 G + .5 \sqrt{S. A.}}{2}$$

The details of measurement are as follows:

The rating of every yacht entered to sail in a race shall be ascertained by adding together length (L.), beam (B.), 0.75 of girth (G.), and 0.5 of the square root of the sail area (S. A.), and dividing the sum by 2 according to the following formula:

$$\frac{L + B + .75 G + .5 \sqrt{S. A.}}{2} = \text{Rating}$$

In all ratings figures in the second place of decimals below 0.05 shall be disregarded, and those of 0.05 and upward shall count as 0.1.

The length shall be taken between the outer edges

Fig. 4.

of the official marks of the Y. R. A., as placed by the owner at the bow and stern of the yacht, this length to represent the extreme length for immersion, provided always that if any part of the stem or sternpost or other part of the vessel below the marks for length project beyond the length taken as mentioned, such projection or projections shall, for the purpose of the rule, be added to the length as stated; and pieces of any form cut out of the stem, sternpost or fairline of the ridge of the counter, with the intention of shortening the length, shall not be allowed for in measurement of length, if at

or immediately below the marks for the length, nor above if within 6 in. of the water level.

The breadth shall be taken from outside to outside of the planking, in the broadest part of the yacht, and no allowance shall be made for wales, doubling planks or mouldings of any kind.

The girth shall be taken from l.w.l. to l.w.l. under the keel at a station 0.6 of the distance between the outer edges of the length marks from the fore end. The girth shall be measured along the actual outline of the vertical cross section at that station at right angles to the l.w.l., see Figs. 1 and 2, *a a'*, and Figs. 3 and 4. If the draft forward of that station, *e e*, Fig. 2 (not including the girth of a bulb, if any), exceeds the draft at that station, *a a'*, twice such excess to be added to G. In taking these measurements all hollows in the fore and aft under-water profile of the vessel to be treated as filled up straight. Should a piece be added, as at *b*, then a line

Fig. 5.

must be drawn from *b* to *c*, and the girth be measured to *d*. (Fig. 1.)

In the case of a centerboard, 1.5 times the extreme drop of the board below the keel to be added to the girth as taken at *a a'*; and if the board is dropped below the keel at *e e*, the excess shall, nevertheless, be added to girth in accordance with the rule. Bulb or ballasted centerboards to be measured as fixed keels.

[This has since been changed so that twice the drop of board is measured.]

Length.—The length (L.) for use in the formula shall be obtained by measuring the length over all on deck, and deducting from this length the distances in to the bow and stern marks as fixed by the owner, from perpendiculars let fall from the bow and taffrail, as shown in the diagrams. These perpendiculars if measured when

Fig. 6.

the yacht is afloat are to be obtained by a hand lead sunk two or three fathoms deep, so as to insure a steady line to measure from. The distances in from the line are to be taken by a rod placed parallel to the water surface, as shown in the diagrams.

After the over-all length has been taken the measurer must see that the crew are placed at and about the mid over-all length. (See Rule 14.) He must then ascertain that the yacht is not immersed at the l.w.l. beyond the length represented by the owner's marks at the bow and stern.

If a yacht is measured in a tideway, the measurer must view and verify the marks in smooth and during slack water; and the overhangs must be measured in smooth and during slack water.

If the measurement for length is obtained when the yacht is ashore, the position of the bow and stern marks must be afterward verified or checked when the yacht is afloat in racing trim in smooth water, and before the certificate of the measurement is sent to the secretary.

The over-all measurement must be taken parallel to the l.w.l. above the deck, starting from any convenient point forward on the rail, knee, etc., ahead of the fore end of the l.w.l.

When the length over all is taken with rods, a line should be stretched taut from the point forward to the taffrail to facilitate the accurate shifting of the rods.

Beam.—The beam may be measured when the yacht is afloat or ashore. The beam shall be taken by means of a straight edge and plumb line.

Girth.—The girth is to be taken from center disk to center disk (*a a*) at right angles to the l.w.l. under the keel, following the curve of the cross section as shown in Figs. 1, 2, 3 and 4, and must necessarily be measured when the yacht is on the stocks or laid ashore.

The practical results from year to year under the "Rating Rule" in its last years and the new "Lineal Rating

Fig. 7.

Rule" are shown in the following midship sections, most of which, as stated last week, were given to Mr. Æmilus Jarvis by the British designers.

Fig. 5. The 40-rater Corsair was designed by Arthur E. Payne in 1892, and made a good record in her class that year, but was later outclassed by yachts of more hollow section and nearer to the fin-keel in type. Her dimensions are: L.w.l., 58ft. 8in.; beam, 14ft. 6in.; draft,

Fig. 8.

11ft.; S. A., 4,096sq.ft. Corsair possessed excellent accommodation, she was a good sea boat, and her construction was stanch and durable.

Fig. 6. The 40-rater Isolde, designed by Will Fife, Jr., and built in 1895, was one of the last racing yachts built under the "Rating Rule." Her dimensions are: L.w.l., 60ft.; beam, 17ft.; draft, 11ft. 6in.; S. A., 4,000sq.ft.

Fig. 9.

She was by no means as extreme in type as the yachts of the year in the smaller class.

Fig. 7. The 20-rater Audrey was designed by Lord Dunraven to meet Niagara and her twin sister Isolde, both 20-raters, in 1895, and was built by Summers & Payne. She was an extreme fin, as shown by the solid lines in the figure, her dimensions being: L.w.l., 44ft.; beam, 13ft. 2in.; draft, 10ft.; S. A., 2,700sq.ft. Audrey was not a success, and when the new rule was adopted in 1896 she was materially altered to profit under it. The changes are in part shown by the broken lines in Fig. 3; she was replanked, and the angles between gar-

boards and fin were filled in to reduce the girth, the bulb, we believe, being recast and the draft slightly decreased. The changes did nothing to improve the type of the yacht; she was still the same fin-keel racing machine, with no more internal space or headroom than before.

Fig. 8. Flatfish, designed by J. M. Soper, and built by Fay & Co. in 1894, is one of the extreme fin type built under the "Rating Rule." She was a 5-rater, of 32ft. l.w.l.; beam, 10ft. 4in.; draft, 7ft. 9in.; S. A., 919sq. ft. It is claimed that she is a very good sea boat, but we cannot vouch for the statement.

Fig. 9. Norman is another 5-rater, built in the last year of the "Rating Rule," 1895, by Charles Sibbick, who also designed her. She is on the l.w.l. 29ft. 6in.; beam, 11ft.; draft, 8ft.; S. A., 1,156. She was a very successful boat.

Fig. 10. Heartsease was also designed and built by Chas. Sibbick for the same class as Norman, but in 1896, the first year of the present rule, the class limit being 36ft. "Lineal Rating" instead of the old 5 rating. Her dimensions are: L.w.l., 31ft. 5in.; beam, 9ft. 2in.; draft, 6ft.; S. A., 1,300sq.ft. A comparison of Heartsease with Norman and of the original Audrey with the same yacht as rebuilt in 1896 shows the first effect of the new

Fig. 10.

rule, a very moderate and trivial one. The displacement was increased somewhat and the draft was lessened; but the general type was practically the same, and there was no improvement in the matter of internal room.

Fig. 11, a yacht of 104 rating, was designed by J. M. Soper and built by Fay & Co. in 1897, her dimensions being: L.w.l., 84ft. 2in.; beam, 21ft. 1in.; draft, 15ft. 6in.; S. A., 10,600. She was of course designed specially under the "Lineal Rating Rule," and shows just what the rule is producing now that it is fully understood by designers.

Fig. 12. This yacht was designed by G. L. Watson

Fig. 11.

last year, and was very successful so far as the rather meager racing in the larger classes gives reliable results. She is 75ft. 9in. l.w.l.; beam, 18ft.; draft, 13ft. 6in.; S. A., 7,600. The section is certainly an admirable one so far as accommodation is concerned.

Fig. 13. This is the section of a design for the present year, a 65ft. lineal rater, or the equivalent to the old 40-rater, such as Queen Mab. A comparison with Isolde's section will show the direct result of the new rule.

Fig. 14. This is a section of a "fast cruiser" for the present season, of about the 65ft. class.

Fig. 15. Design for 52ft. lineal rating for 1898.

Fig. 16. Section for 52ft. lineal rating class.

Fig. 17. Section for 52ft. lineal rating class.

Fig. 18. Section for 36ft. lineal rating class.

Fig. 19. Section for 36ft. lineal rating class.

Fig. 20. Section for 30ft. lineal rating class.

Fig. 21. Section for 24ft. lineal rating class.

Fig. 22. Section for 24ft. lineal rating class.

Fig. 23. Section for 18ft. lineal rating class.

These sections represent the current practice of Messrs. Watson, Fife, Payne, Soper, Nicholson, Hope and Froude in designing under the new rule for the racing classes. Sections 19, 20 and 22 are somewhat on the freak order, but they are small boats intended for the Solent racing and the peculiar local conditions. In these small classes the question of accommodation does not count; they are but day racing boats, and they have to

compete with the fin-keels which have survived the change of rule.

In the larger classes, from 30ft. L. R. upward, the sections are one and all of a wholesome type, with good displacement, compact dimensions, and a reasonable amount of internal room. It is interesting to note that

Fig. 12.

Corsair has during the past season raced with good success in the 65ft. class.

So far as British yachting is concerned, the rule seems to have achieved the main end for which it was framed, the production of yachts of fuller body and more compact dimensions than the fin or semi-fin. There is nothing in the report of Mr. Jarvis to throw light upon one important point, however, the form of lateral plane and rudder. We believe that most, if not all, of the new boats in the larger classes have a normal lateral plane, such as was found half a dozen years back, as would nat-

Fig. 13.

urally result from the decrease of draft, and that the rudder is hung on the usual raking sternpost. The balance rudder and the fin-keel contour, as in Syce, Norota and Quissetta, on this side, have apparently been discouraged by the rule.

When we come to the consideration of the rule and its probable results in this country, there are wide grounds for speculation, but there seems no reason to apprehend that it would produce a type in any way inferior to that which has grown up under it in England.

As applied by the Y. R. A. method, with the full drop

Fig. 14.

of board measured for girth, it positively excludes the centerboard; but it would be possible so to adjust the factors as to give an equal choice of centerboard or keel.

The Columbia Y. C., of Chicago, elected the following officers on March 5: Com., Robt. Young; Vice-Com., C. Mack; Rear-Com., J. Ingersoll; Sec'y, W. S. Bougher; Financial Sec'y, W. D. Payne; Treas., F. M. Farwell; House Committee: Wm. Eben, chairman; A. M. Bowles, F. M. Porter, M. J. MacNamara, E. J. Sharpe; Regatta Committee: Thomas Bayle, chairman; R. J. Summers, F. B. Williams, D. C. Cregier, Jr., H. J. McCormick; Delegate, E. P. Warner; Meas., Sidney Davis; Historian, De La Fontaine. The annual race to Michigan City to take place as usual on the third Saturday in June.

Yacht Measurement.

STOCKHOLM, Sweden, Feb. 22, 1898.—*Editor Forest and Stream:* We have seen that all rules of measurement from "the old 94 rule" to the last one have been "beaten." This has been the case in about all directions, but most in what concerns the sail-carrying power. In England, for instance, when the beam had to be measured this was cheated by means of decreasing that dimension and increasing the depth and displacement. A little further on and they cheated it again by placing all the lead outboard and lightening the construction of the hull, spars, etc. Later on in the Seawanhaka and English length and sail area rules these were "beaten" by making the displacement more effective to carry sail by increasing the lever for the righting moment. The sail-carrying power itself could not of course be altered materially, as that would affect the sailing too much, but all that could be of influence on that power has been a subject for the designer's ingenuity.

Now the designers, as you know, have, I believe, had quite sufficient time and practice to get all out of this kind of designing. Of course other details have not been entirely left by themselves, but the most of the designer's skill has been engaged in this direction.

After all this it would appear that the time has come when the sail-carrying power ought to be treated in a more direct way by measuring the righting moment at some angle of inclination. The larger yachts, which ought to have depth of hull, to be measured at say $7\frac{1}{2}^\circ$, and the smaller ones, where beam and initial stability is more wanted, say at 15° of an inclination.

I suggested about four years ago a rule of measurement in such a way, which in its details should appear as follows:

$$\text{Corrected length} = L_r = \frac{L + 10^4 \sqrt{M}}{2} \text{ for large yachts, and}$$

$$\text{Corrected length} = L_r = \frac{L + 8^4 \sqrt{M}}{2} \text{ for smaller.}$$

L. being equal to L.W.L. and M. to righting moment at $7\frac{1}{2}^\circ$ for large and 15° for small yachts.

This rule is designed only with respect to speed. For whole-some yachts where it is desired to have room on deck and below in a fair proportion to cost, one must put in an element in the rule of measurement answering to this desire; for instance,

as proposed by another yachtsman, $\frac{S_g}{S_k}$. Sg. being the girth taken from rail to rail along the actual outline of the vessel, and Kg. being the girth from rail straight round the heel to rail. The formula would then be:

$$L_r = \frac{S_g}{Kg} \times \frac{L + 10^4 \sqrt{M}}{2} \text{ or } L_r = \frac{S_g}{Kg} \times \frac{L + 8^4 \sqrt{M}}{2}$$

for large and small yachts respectively.

Perhaps it might be objected to these rules that it would be very difficult for the designers to calculate M. That is true at the start. But we may recollect that under such a rule there would not be any pressing necessity to place all ballast in a fixed keel outboard. One could very well have part of it inside and movable, as only the actual stability should be measured. With for instance 25 per cent. of the ballast inside it would of course be a small matter to get the desired rating by trimming the vessel.

The advantages of such a rule of measurement may be in a few words summed up as follows: A free hand to the designers to turn out a yacht safe in all conditions of wind and weather, combining a maximum of room on deck and below, with a minimum of prime cost; i. e., a seaworthy, roomy and strongly built vessel, fast in proportion to desired room and stability, and of good appearance; that is to say, the designers should not be by a taxation of beam be forced to take all out of that dimension.

A free hand (and no restrictions whatsoever wanted) for the builders to make improvements in construction, without compelling them to build too light or too weak, and a free hand to owners in racing to take all the possible speed out of the seaworthy and roomy type of yachts, which they have desired.

With all this, there is liberty for skill to devise improvements. I think the rule would not be cheated in any way, and the best of it is that such a rule would make yachting much cheaper and more pleasant, and that one could get more value for the money.

I have not perhaps gone sufficiently into details, but I think that all interested may by an investigation of reasons for and against reach my conclusions, that this is practically and theoretically the only right way to avoid cheating the general desire of the yachting public without binding the hands of designers.

In accordance with the proposal in the FOREST AND STREAM of Jan. 29 that all contributions be given simply a designating letter, which I think very just, I for publication only sign

J. E.

Osceola, steam yacht, designed by G. Hilmann and built by Samuel Pine for Thos. L. Watt, American Y. C., was launched on March 9 at the foot of Twenty-fourth street, South Brooklyn. She is of wood, 128ft. o.a., 116ft. l.w.l., 18ft. beam, 10ft. hold and 7ft. 6in. draft. She will be schooner-rigged and Capt. Clausen, formerly in command of Intrepid, schr., for Mr. Watt, will be her skipper.

The new secretary of the British Yacht Racing Association, succeeding Mr. Dixon Kemp, is Brooke Heckstall-Smith No. 2, Haarlem Mansions, West Kensington, W., London.

YACHTING NEWS NOTES.

The annual meeting of the Rhode Island Y. C. was held in Providence on Feb. 28, the following officers being elected: Com., John Jenckes; Vice-Com., Hon. Frank F. Olney; Rear-Com., Wm. B. Bannigan; Sec'y, A. M. Potter, D.D.S., P. O. Box 1200; Treas., E. T. Herrick, P. O. Box 1200; Race Committee: E. T. Banning, chairman; A. M. Potter, Samuel Whiteley, E. O. Law, F. E. Field. The club voted to join the North American Yacht Racing Union and Elmer E. Hubbard and Arthur M. Potter were elected delegates to the Union. A committee of five, of which Capt. F. P. Sands, of Newport, owner of Daffodil, is chairman, was appointed to confer with the other clubs in Narragansett Bay and if possible to form an association there similar to the one existing in Long Island Sound.

On March 1 the Harvard Y. C. elected the following officers: Com., J. A. Burnham, Jr., '99; Vice-Com., C. M. Whitman, '99; Rear-Com., H. Sampson, '99; Sec'y and Treas., G. T. Baker, '99; Regatta Committee: E. A. Boardman, '99; C. B. Curtis, 1900; G. E. Hills, 1 L.

The Seawanhaka C.Y.C. has taken active measures to provide sport for the golf players of the club during the coming season, and a golf association has been formed within the club, under the management of a special committee: Messrs. George Bullock, Henry W. Hayden, Chas. W. Wetmore, Nelson B. Burr, B. Watkins Leigh and F. T. Underhill. A nine-hole course will be opened on Center Island on May 28. Mr. Nelson B. Burr, 31 Nassau street, is the treasurer of the committee.

Mongoose, 21ft. knockabout, has been sold through F. B. Jones to W. D. Ford, of New York.

Gossoon, cutter, has been sold by P. T. Dodge to W. Rosen-garten, of the Philadelphia Y. C.

The Brooklyn Y. C. held its annual meeting on March 9, the following officers being elected: Com., C. H. Humphreys, sloop Kangaroo; Vice-Com., James L. Lyons, sloop Mary A.; Rear-Com., Chas. H. Oliver, catboat Carrie; Meas., Robert C. Hopkins; Treas., Willard Graham; Sec'y, William Cagger; Trustees: S. S. Golding, P. H. Jeannot, R. L. Neville, E. H. Chandler, E. H. Converse, Edward Salt; Race Committee: Louis Wunder, Frank L. Townsend, H. W. Kilbourne; Membership Committee: A. S. Richoffer, Charles H. Frost, John N. Gans. The club adopted the racing rules of the Sound Y. R. A.

Mr. Richard Grant, for many years secretary of the Royal Yacht Squadron, has resigned that office.

The FOREST AND STREAM is put to press each week on Tuesday.

Rifle Range and Gallery.

Trap-Shooting.

Shell Mound Range.

SAN FRANCISCO, Feb. 28.—*Editor Forest and Stream:* Fairly good weather greeted the marksmen at Shell Mound range yesterday. A very notable score was made by F. O. Young at 200yds., Columbia target, 10 shots, in competition for the all comers' rifle medal. Mr. Young made 37 rings in the 10 shots, thus breaking the club record, which was 41 rings.

The Red Men's Schuetzen Company had its regular monthly medal shoot, with winners in the different classes as follows:

First class, M. Dickert 216; second class, J. A. Mohr 316; third class, George Heuer 337; fourth class, Capt. Henry Grieb 267. Best first shot, John Tiedemann, 25; best last shot, F. Richards, 24.

In the Norddeutscher Schuetzen Verein monthly medal shoot the following were the high men:

Champion class, F. P. Schuster 431; first class, F. Koch 409; second class, J. Thode 375; third class, D. Schinkel 375; fourth class, A. F. Meyer 311. Best first shot, H. Stelling, 24; best last shot, W. Morken, 23.

The San Francisco Schuetzen Verein held its regular monthly bullseye shoot, 200yds., the score resulting thus:

L. Bendell 334; O. Bumeister 366, J. Gefken 443, F. Koch 455, J. D. Heise 483, J. Woebecke 530, A. Jungbluth 573, J. Utschig 620, H. Stelling 753, J. Thode 870, J. Tiedemann 886, C. F. Rust 946, D. B. Faktor 1079, J. Lankenau 1187, F. Attinger 1196, W. C. Morken 1225, H. Zecher 1236, A. H. Pape 1403, F. P. Schuster 1475, D. Salfeld 1493.

Following are the winners in the Germania Schuetzen Club's bullseye shoot:

John Young 176, J. D. Heise 278, W. C. Morken 342, H. Zecher 409, F. Rust 606, L. Haake 617, J. Utschig 734, John de Witt 791, A. Jungbluth 852, J. Gefken 853, F. P. Schuster 864, E. H. Goetz 1122.

In the competition shoot by the same club John Utschig led with 74 out of a possible 75, A. Strecher 72, D. B. Faktor 70 and F. P. Schuster 70, at 200yds.

The Columbia Pistol and Rifle Club had several contests which developed considerable interest, with scores as follows:

Members' rifle medal shoot: A. B. Dorrlor, 51, 71; J. E. Gorman, 63, 67; A. H. Cady 77, 83.

All comers' rifle medal shoot: F. O. Young, 37, 56, 60; A. H. Pape 48, 50, 58.

Siebs pistol medal shoot, 10-shot scores: J. E. Gorman 40, 43, 46, 47; F. O. Young, 48, 52, 57, 59; J. H. Cady, 76; G. M. Barly, 56.

Colts revolver, Bisley trophy, 10-shot scores: F. O. Young, 59, 64; A. B. Dorrell, 59, 60, 68; M. J. White, 79.

Medal shoot, with .22 and .25cal. rifles, 10-shot scores: A. B. Dorrell 31.

Cincinnati Rifle Association.

CINCINNATI, O., March 6.—The following scores were made by members of the Cincinnati Rifle Association at their range to-day. Conditions: 200yds., off-hand, at the German ring target. Uckotter won his expert marksman's medal to-day, having 30 scores of 180 or better and four shoots to spare yet. Gindele was declared king to-day with a score of 227. Hasenzahl wins the Dietrich medal with a score of 65 on the honor target. Gindele wins the Uckotter trophy for the month of February:

King target:

Gindele	24	24	23	21	22	25	25	23	22	18	—227

Zettler Rifle Club.

ON March 7 Louis Buss won the gallery shoot, which closed the Zettler Rifle Club's indoor tournament. Both the ring and bullseye targets were used. At both targets a competitor was allowed as many shots as he cared to fire; at the ring target the two best scores, 3 shots each, counted. The bullseye targets were measured. Scores:

Ring target, 3-shot scores, best two to count: Louis Buss, 75, 74—149; M. J. Dorrlor, 74, 74—148; Henry Holges, 74, 74—148; L. P. Hansen, 73, 74—147; Louis Flack, 73, 74—147; Gus Zimmerman, 73, 73—146; H. M. Pope, 72, 73—145; G. D. Wiegman, 72, 73—145; Henry Mahlenbrock, 72, 72—144; Reinhold Busse, 71, 73—144; G. N. Obert, 72, 72—144; G. P. Williams, 72, 72—143; H. D. Muller, 71, 72—143; Dr. W. G. Hudson, 71, 72—143; C. H. Schukraft, 70, 73—143; M. B. Engel, 71, 71—142; Louis Vogel, 71, 71—142; W. A. Hicks, 70, 71—141.

Premium for best five tickets: Dorrlor and Buss, 366, divided. Bullseye target, 4in. center, best center shot to count: Schukraft 10½ degrees, Buss 11, Dorrlor 11, Muller 12, Obert 13, Busse 13½, Zimmerman 14, Floch 15, Weizman 16, Tewel 20, Vogel 20, Meyer 20½.

Premium for the most bullseyes: Zimmerman and Schukraft, 13 each, divided.

Elm Road vs. Essex Indian Rifle Club.

THE return match between the Elm Road Rifle Club and the Essex Indian Rifle Club was shot on March 8, at the Elm Road rifle range. The distance was 66ft., 25 ring target. The next match of the E. R. R. Club will be with the Our Own Rifle Club on March 21 at Range No. 90, Elm Road. There will be a match shot between John Then and J. Alexander, one between H. Reinhardt and J. Hehsdoerfer. Each match for a purse of \$5. Then the former two will shoot a team match with the latter two for \$5.

Essex Indian Rifle Club.	Elm Road Rifle Club.

The Iroquois Rifle Club.

The Iroquois Rifle Club has issued a challenge to the Pittsburg Rifle Club, both of Pittsburg, the shoot a gallery team shoot. Monday of this week was set as the time for representatives of both clubs to meet for the purpose of arranging the match.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 22-23.—Stanhope, Ia.—Central Iowa shooting tournament, for amateurs only. Gold medal representing Iowa championship. Manufacturers' agents allowed to shoot for price of targets and birds.

March 22-24.—Elkwood Park, Long Branch, N. J.—Interstate Association's sixth annual Grand American Handicap. 25 birds, \$25, birds extra; \$1,500 guaranteed to the three high guns; \$600, \$500 and \$400; all surplus added.

March 28-30.—Galena, Kans.—Interstate shoot. Two days targets; one day live birds; \$50 a day added. W. W. McIlhany, Sec'y.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Sec'y.

April 5-8.—Baltimore, Md.—Baltimore Shooting Association's spring tournament. Two days targets, \$100 added each day. Two days live birds, \$500 guaranteed in Maryland Handicap. All surplus added. Geo. L. Harrison, Sec'y-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 7-9.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting park, under the management of J. A. Corry.

April 8.—Bridgeport, Conn.—Target tournament of the Bridgeport Gun Club. J. G. Kingsbury, Sec'y.

April 13-15.—Atchison, Kan.—Manufacturers' fourth annual tournament; \$500 added; \$50 high average. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 13-15.—Macon, Ga.—Tournament of the Interstate Association, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

April 15.—Worcester, Mass.—Tournament of Massachusetts State Shooting Association, under the auspices of the Worcester Sportsmen's Club. A. W. Walls, Sec'y.

April 19-22.—Lincoln, Neb.—First annual amateur tournament of the Lincoln Gun Club. Each day \$50 added to the purses. Geo. L. Carter, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, manager. Address all communications to J. L. Head, Peru, Ind.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17-20.—Newark, N. J.—Tournament of the New Jersey State Sportsmen's Association, on the grounds of the East Side Gun Club. T. H. Keller, Sec'y.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-26.—Wilmington, N. C.—Tournament of the Interstate Association, under the auspices of the Eastern Dog and Game Protective Association, H. McL. Green, President..

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 2-3.—Alton, Ill.—Second annual bluerock tournament of Piasa Gun Club. F. C. Riehl, Sec'y.

June 7-8.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 7-8.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League of Indiana, on the grounds of the Limited Gun Club.

June 8-9.—Findlay, O.—Annual tournament of the Magautrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-16.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Bluerocks thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

Sportsmen's Exposition.

Well equipped ranges are provided for the large number of competitors who have entered in the different matches, and the crack of the rifle and the heavier reports of the revolvers will be a coincident feature of the Exposition from its opening to its closing. The "any" revolver championship, 20yds., 50 shots, 25 minutes limit to each competitor; the "military" revolver championship match, open only to U. S. Government troops, standard .38cal. Government revolvers only, standard American target reduced to 20yds., with Creedmoor count; the pistol championship, 50 shots in 50 minutes, all pistols of .22cal., barrels not over 10in., and the rifle championship match, open to all, .22cal. rifles, 50 shots in 10 strings of 5 shots each, distance 100ft., are the main events. In addition to the foregoing there are revolver, pistol, German ring and standard American re-entry matches. The competition is under the direction of committees as follows: Rifle: F. B. Crowninshield, chairman, and C. W. Hinman, J. T. Humphrey, C. H. Eastman, J. E. Kelley. Revolver: F. B. Crowninshield, chairman, and John B. Paine, L. Bell, E. E. Partridge, B. Ames.

DRIVERS AND TWISTERS.

The Grand American Handicap of 1898 will be well worth watching, as the entry list contains the names of about every shooter of prominence in trap-shooting circles in this country. The rapid growth of this annual affair, only six years old by the way, shows plainly enough that the Interstate Association knew what it was about when it inaugurated the first annual Grand American Handicap in 1893; and also proves conclusively that the Interstate Association knows how to handle the shooters of the country to their entire satisfaction. It is a great event, and that of 1898 is going to be even greater than that of 1897.

The annual report of the Philadelphia Trap-Shooters' League, issued at the close of its first season's work, shows that there have been in the neighborhood of 70,000 targets trapped at the eleven shoots held under its auspices, about 22,000 of that number having been trapped in the team shoots. The winner of first place was the Wayne Gun Club; next to that club came the Florists' Gun Club and the Roxborough Gun Club in order named. The order of merit that is, for percentages of targets shot at, was as follows: Independents .818, Florists' .790, Penn .777, Silver Lake .752, Roxborough .700, Frankford .681, Southwark .654, University of Pennsylvania .650, Wayne .621, Glen Willow .599, Forest .553. Harvey Ridge, of the Independents, won first place in the individual averages of those who shot in each of the eleven matches, breaking 87 per cent. of the 275 targets shot at. All targets in the team race are thrown at known traps, known angles. The opening shoot of the next season will be held on April 2, when new handicaps will be awarded and a new system of scoring points will be adopted in all probability.

An interesting forthcoming tournament is that of the Interstate Association, given for the Macon Gun Club, at Macon, Ga., beginning on April 13 and lasting three days. The Macon Gun Club adds \$200. On the first and second days there will be respectively ten target events, six at 15, entrance \$1.50, and four at 20 targets, \$2. Each event has four moneys, 40, 30, 20 and 10 per cent. On each of these days \$100 will be added. On the third day there are four live-bird events on the programme: No. 1, 5 birds, \$5, two moneys, 60 and 40 per cent.; No. 2, 7 birds, \$7, three moneys, 50, 30 and 20 per cent.; Nos. 3 and 4, each 10 birds, \$10, four moneys, 40, 30, 20 and 10 per cent. Class shooting. Birds 25 cents, price included in all entrances. The grounds are about ten minutes' ride from the center of the city. Shooting commences each day at 9 o'clock. Guns and ammunition forwarded to Etheridge & Baker will be delivered at the shooting grounds. Interstate Association rules will govern all events. Application has been made to secure reduced railroad rates, concerning which more will be published later.

The programme of the Interstate shoot of the Galena Gun Club can be obtained of the secretary, W. L. McIlhany, Galena, Kans. There will be two days at targets, one at live birds. Louis Erhardt and Jack Parker will run the shoot, which conveys all the information that is necessary as to how the shoot will be managed. There are ten events for the first and second days respectively, 15 targets, \$1.50, \$5 added to each. On the third day there are three live-bird events on the programme, No. 1, 5 birds, \$3; No. 2, 7 birds, \$5; No. 3 is the Kansas wing shot championship, 50 live birds, \$10, optional sweep. After this event is finished sweepstakes will be shot to suit the pleasure of the visitors. High guns win all moneys in the live-birds sweeps. In the target events the Rose system will prevail. Keep in mind the \$500 added, and \$50 for highest average.

The first regular monthly club shoot of the 1898-99 series of the Brooklyn, N. Y., Gun Club will be held on Saturday next, March 19. Among the prizes for distribution in February next will be an order on the club's exchequer for a sum covering the full entrance money, including the price of the birds, for the winner's entry in the Grand American Handicap of 1899. This prize will be given to the man making the highest aggregate in eight out of the twelve monthly shoots. The club shoots are handicap affairs, 50 targets per man, unknown angles, handicap allowance of extra targets to shoot at, no man allowed to score more than 50 breaks in any one shoot. After the shoot on Saturday next, the club will hold its monthly gatherings on the second Saturday of every month.

The Piasa Gun Club, of Alton, Ill., elected J. T. Drummond, President; C. P. Johnson, Vice-President; F. C. Riehl, Secretary; R. F. Seely, Treasurer, and A. J. Howell, Field Captain. The club has fixed upon June 2 and 3 as the dates for its second annual bluerock tournament, at the Douglas Park range in that city. The most successful amateur shoot of the State last year was given there in the fall, and they hope to eclipse that record in this event. The programme will be arranged to suit old shooters, and there is to be \$150 added money, equalized on all purses. The lists will be open without discrimination to all shooters, and they hope to accommodate 100 men. Shooters will be enabled to leave here at the close of this programme and go either by river or boat to Peoria, to attend there the annual Illinois State shoot.

The following act has been read once in the New York State Assembly, and referred to the Committee on Codes: "Sec. 1. Section 640 of the penal code is hereby amended by adding thereto, at the end thereof, a new subdivision to be known as subdivision 16, and to read as follows: Sub-division 16. Not being a member of a regularly incorporated shooting association, enters into or trespasses upon the grounds of such association or comes within 200yds. thereof for the purpose of shooting at pigeons or other birds, which may escape from the grounds of such association or who shall willfully injure any of the grounds, structures, buildings or other property of such association, shall be deemed guilty of a misdemeanor. This act shall take effect immediately."

The first place in shooting honors at the close of the Emerald Gun Club's shooting season was won by Dr. G. V. Hudson, with a percentage which numbers 84 1-3, and points which numbered 19½. It was far from an idle day saunter to defeat the formidable array of good shooters in the list of the club's contestants. The Doctor is fifty-four years old, far yet from being an old man, and too ripe in skill and intellect to be classed as young. He is in the happy middle years of life. He was the first to take action in the organization of the Emerald Gun Club some seventeen years ago, and the years have added to his enthusiasm instead of dulling it.

Keep in mind that the Platte City Gun Club's tournament, Platte City, Mo., precedes some of the other Western tournaments, and gives opportunity for competition and practice. There are ten events on the first day, 15 and 20 targets, entrance \$1.25 and \$1.50, \$2 or \$2.50 added money to each event. Second day's events are the same, with a 2-man team race, 25 targets, \$4 each team, \$5 added. To the longest straight \$5. The Rose system will govern target divisions. Manufacturers' agents and paid professionals can shoot for prices of birds only. Guns and ammunition may be shipped care of S. Redman, secretary.

Mr. Harry Marlin writes us that Col. George E. Bartlett, famous as Government scout, deputy marshal, and expert rifle and pistol shot, has accepted a position with the Marlin Fire Arms Co. He will test all guns made by the company, and will represent them at sportsmen's fairs, giving exhibitions of rifle and pistol shooting. This week he will be in attendance at the Sportsmen's Exposition at Boston, where the Marlin Co. has a large booth.

Mr. Geo. W. Mains, secretary of the Enterprise Gun Club, Reynoldton, Pa., writes us under date of March 14 that at a meeting of the club on the 12th inst., a list of officers was elected as follows: Fred Stephan, President; John Owens, Vice-President; Geo. W. Mains, Secretary; P. F. Calhoun, Treasurer; Wm. H. Crouch, Captain. He further informs us that their tournament is fixed for April 22 and 23, and their programme will be out the first week in April.

Each contestant in the Grand American Handicap should keep in mind that his gun should not weigh over 8lbs., this exclusive of the recoil pad and holder. They should further note that a gun is liable to be weighed at any moment, even after the competition has begun, and if from change of climate or other reason the gun takes on weight it may not receive the unanimous approval of the management.

Mr. Edward Banks, the secretary of the American E. C. & Schulze Powder Co., takes to the duties of his new office in the same kindly and purposeful manner that a duck takes to the water. Dropping the swinging of the editorial lead pencil has not in the least affected the swing of his Winchester pump gun, as a glance at his shooting will demonstrate. In a recent meeting of the Boiling Springs Gun Club he broke 48 out of 50.

On March 18 the Carteret annual handicap event commences at 9:20 A. M. It is a handicap event; shooters to be handicapped by the executive committee on the day of the shoot. The event is at 25 birds, \$25, moneys 40, 25, 15 and 10 per cent., 10 per cent. to the club. It is open to members of the Larchmont, Westminster, Country, Riverton, Herron Hill, Philadelphia and Tuxedo clubs.

This week there is a gathering of the clans at Utica, N. Y., where the four days' shoot, March 15-18, of the Oneida County Sportsmen's Association is in progress. Next week it is Elkwood Park; the week after that the boys will be at the Pennsylvania State shoot in Reading, Pa., and then the week following Reading there is the Baltimore Shooting Association's annual spring tournament, April 5-8.

Mr. D. M. Lefever, of the Lefever Arms Co., of Syracuse, N. Y., is visiting his friends among the trade with a new single-trigger gun that he claims is all that such a gun is or ought to be. As he puts it: "It's the only single-trigger gun that's worth anything." Uncle Dan, as the boys call him, is as popular as they make 'em, and anything he has to show always receives as much attention as Uncle Dan himself—and that's saying a good deal.

Mr. J. L. Denning, secretary of the Lake Side Rod and Gun Club, Burlington, Vt., writes us that at a meeting held on the evening of March 9 officers were elected as follows: President, E. E. Morgan; Vice-President, W. L. Stone; Secretary, J. S. Denning; Treasurer, W. S. Phelps; Captain, L. O. Harding; Board of Directors: J. G. Burns, B. R. Seymour, H. E. Spear, F. Owen, B. H. Eagan.

Under date of March 9 Mr. Geo. L. Carter, secretary Lincoln Gun Club, writes us as follows: "After mailing you the dates of our first annual amateur tournament, to be held at Lincoln, Neb., we find that the dates claimed, April 13 to 15, were conflicting with our neighboring city, Atchison, Kans. Therefore we wish to cancel those dates and name April 19, 20 and 21 instead."

The New Utrecht Gun Club holds its first shoot on its new target grounds at Woodlawn on Saturday of this week.

The verses in another column, from the pen of Mr. R. Van Gilder, secretary of the Knoxville Gun Club, are a parody on Mr. Rudyard Kipling's verses "The Vampire." While treating the matter in a serio-comic manner, Mr. Van Gilder plainly has an ulterior purpose to bring forward tersely the recurring problem of amateur and expert, producer and consumer.

The main event of the Bergen County Gun Club's shoot on March 26 is the Bergen county trophy, a silver water pitcher, to become the personal property of the winner. This event is a 25-target handicap, \$1, optional sweep if desired. The shooting in this event will begin at 2 o'clock. Sweepstake events will be shot before and after the handicap. Everybody welcome.

Those who failed to receive a programme of the Pennsylvania State Sportsmen's Association's tournament should forthwith apply for one to the corresponding secretary, Mr. Edward Yeager, Reading, Pa. The officers are hustling to make the shoot a success. Mr. Elmer E. Shaner, of Pittsburg, will manage the event.

Last week Mr. J. Lindzey, representing the trap-shooters of Middlesex county, made through Mr. Carl von Lengerke a challenge to the shooters of Hudson county to shoot a match about the middle or latter part of April. A prompt and affirmative reply was expected.

Under date of March 8 Mr. A. W. Walls, secretary, informs us that the date of the Massachusetts State Shooting Association's tournament, under the auspices of the Worcester Sportsmen's Club, has been fixed to take place on April 15.

In the regular shoot of the Unknown Gun Club in Brooklyn, twenty members present, Brown, 26, Vroom, 29, and Voorhees, 27, tied on 7 in the 10-bird event. Houseman, 30yds., killed 6 and took second money. There were five tied for third, Skidmore winning with a score of 7 straight in the miss-and-out shoot-off.

Mr. Donald G. Geddes, of the Crescent Athletic Gun Club, made a new club record at Bay Ridge on March 11. He broke 48 out of 50 targets thrown by the magautrap, and finished the 100 with 96 targets broken.

Of the four days of the Baltimore Shooting Association spring tournament two will be devoted to target shooting, \$100 added each day; two days to live birds, \$500 guaranteed in the Maryland handicap on April 8. All surplus added.

BERNARD WATERS.

Anent the Baltimore Tournament.

Editor Forest and Stream:

For some time past there has been a great deal of discussion as to the best plan by which to attract the amateur shooter, and secure his attendance at tournaments where it is a well-known fact beforehand that the expert is sure to be present in goodly number. The old system of division of purses has been tried and found wanting with a great number, and especially with the amateur, because in the first place it permits the dropping for place, and in the second, with the old system of four moneys, assuming there is a straight in every event, shuts out the 80 per cent. man, and as any thinking man knows, there are more shooters to-day who average 80 per cent. and less than there are who average over 80 per cent. The Rose system has been tried for the past two or three years, and while with some it has been received in great favor, still by a larger number of others it has been condemned, and the latter class are confined as a rule to those who can average 90 per cent. or better, and the reason for their dissatisfaction is because it does not enable them to fleece the amateur or poor shooter quite as successfully as they would like.

The expert we have with us always, and especially so if there is anything particularly attractive in the way of large purses, but the amateur is hard to attract under the old or the Rose system, because he stands no show for his money.

The Baltimore Shooting Association have been considering this matter very earnestly for some time in connection with their forthcoming tournament on April 5, 6, 7 and 8, and believe they have formulated a plan for the division of moneys in target events which will not materially lessen the winnings of the expert, but at the same time will enable the poorer shooter to get some return for his entrance, and as long as he can do so he is satisfied, even though the amount be small. For the want of a better name the system which will be adopted will be known as the Winslow system, which may be briefly described as follows:

Instead of constituting 20, 19, 18 and 17 as winners of the four moneys in a 20-target event, as an illustration, this system embraces 20, and 19 for first money, 18 and 17 for second, 16 and 15 for third, and so on down the scale of combinations as far as you are disposed to carry it. Assuming there will be one or more straights in each 20-target event, as well as one or more 19s, then these two scores being on an equality will divide first money; the 18 and 17 will divide second money; the 16 and 15 will divide third money, etc. Should there not be a straight score in a particular event and there should be one or more 19s the 19s will divide first money. Should there be a straight and no 19s the straights will divide first money, and the same rule will apply to the 18 and 17, constituting second money, and 16 and 15, constituting third money. Should there not be either a 20 or 19 in an event then the 18 and 17 will divide first money; 16 and 15 second money, and 14 and 13 third money. Thus it will be seen at a glance that the 75 per cent. man has a chance to draw down something in return for his entrance, and as the 80 to 75 per cent. shooter is largely in the majority and is the class whose presence is so largely desired it is hoped this system will meet with the approval of all, expert, professional and amateur, and do away with the cry, "Oh, there is no show for the 80 or 75 per cent. man."

BALTIMORE SHOOTING ASSOCIATION.

[If under the Winslow system there are three moneys divided in the usual ratio of 50, 30 and 20 per cent., 50 per cent. goes to the 19s and 20s, 30 per cent. to the 17s and 18s, thus leaving only 20 per cent. to the 15s and 16s, the latter two being respectively the 75 and 80 per cent. men. Thus out of a \$10 purse there would be \$2 to be divided between the 75 and 80 per cent. men.]

When there are scores of 15, 16, 17, 18, 19 and 20, the 15s and 16s can never take more than 20 per cent. of the purse, and as there will be many ties on 15 and 16, the 20 per cent. when divided up will be too insignificant for consideration.

Let us take the scores of the recent Hot Springs tournament by way of illustration. There were seven 20-target events on the first day. In the first event, forty-two men contesting, there were five scores of 16, five of 15; so that 20 per cent. of the purse for fourth place would have been divided into ten parts in that event. In the second event, with the same number of contestants as in the first, there were four 16s and seven 15s—that is to say, eleven to divide the 20 per cent.

But if there were four moneys in such a large event, the division would be 40, 30, 20 and 10. This would take the 12s and 13s, 14s and 15s, etc., into the money. Four places would still further reduce the winnings. Again taking the above-mentioned tournament for the purposes of illustration, out of a total of 295 scores in the 20-target events of the first day, only 34 were 12 or under; so that the 261 scores all better than 12 would have been in the money.

In the total percentages for that day there were but six contestants whose averages were under 65 per cent.

On the second day there were but four averages under 65 per cent.

On the third day there was but one.

The Winslow system arbitrarily brings the great class between 65 and 85 per cent. into the money, and as it therefore practically takes in all the competitors in a tournament, the money is so much divided thereby that the winnings are insignificant.

Any system which makes winners by arbitrary ruling instead of by meritorious performance is founded on a wrong principle, and cheapens the value of a competition, if the proper significance of the latter term is to be preserved.

We offer the foregoing as friendly suggestion for what it may be worth. If the system possesses merit which we have overlooked, or if we have failed to do it justice, our columns are open for a free publication of its merits, and a correction of our views if they are erroneous in any way.]

Emerald Gun Club.

The annual meeting of the Emerald Gun Club was recently held at the home of Dr. G. V. Hudson. The rearrangement of the handicaps for the season coming, the distribution of prizes, the election of officers and the consideration of the report of the shooting committee was the important business on hand. In Class A Gus Greiff finished first, with .925; T. S. S. Remsen second. In Class B C. W. Billings was first. Officers were elected as follows: President, W. J. Amend; First Vice-President, Dr. G. V. Hudson; Second Vice-President, L. H. Shortemeier; Secretary, Wm. Joergers; Financial Secretary, J. Woelfel; Treasurer, J. H. Moore.

ON LONG ISLAND.

NEW UTRECHT GUN CLUB.

March 5.—This is the farewell shoot at Dyker Meadow, as traps will be removed to the live-bird grounds at Woodlawn, where target shooting will be continued. The interest manifested yesterday in this branch of our shooting was very evident by the number of members who were present.

The following are subject to handicap, which is not yet complete:

Club shoot:	
D C Bennett1101110100101011110111—18
F A Thompson1111110111111111111100—22

E. G. FROST, Sec'y.

BROOKLYN GUN CLUB.

On March 10 an eminently successful and pleasant all-day shoot was given by the Brooklyn Gun Club under the supervision of its popular manager, Mr. John S. Wright. His industry and solicitude in making a pleasant day for those who attended his tournament is of the sterling kind which finds appreciate response from his friends.

The weather was delightfully pleasant, the day being one of the sunshiny, balmy first days of the springtime, pleasant in itself and pleasant by contrast with the somber days of the winter time now passing away. It was an invitation event, and there were quite enough present to keep the sport going up to the full limit of the club's capacity for throwing blue rocks. An abundance of lunch and hospitable courtesies were provided for the guests present. There was some excellent shooting and consequently close competition.

Nos. 4 and 10 were merchandise shoots, \$1.25 entrance, 50 cents being deducted from each entrance fee, and divided as follows: 50, 30 and 20 per cent., class shooting, to the three highest classes below the highest class.

No. 8 was a handicap race, no man to be allowed a score greater than the highest possible. Ties were shot off at 13 targets, with half the handicap allowances, no man to score higher than the possible 13. It was a hotly contested race in every class. There were two prizes, a gun case and silk umbrella. In the shoot-off between the ties on 25 Ogden won, Bissett shooting well up. Banks was alone in breaking 24, but he gave the umbrella to the 23, which class had a most persistent contest, Baron and Remsen shooting off several ties before Remsen was the final victor.

No. 12 was a special, \$1, the prizes being a fine umbrella and a blouse. Banks and Morley tied, Banks finally winning by a score of 30 straight, Morley being but one behind. Four tied on 9, Remsen winning the shoot-off by breaking 10 straight. Remsen also won the blouse in No. 4 event, beating Ogden by a score of 4 to 3 at 5 targets.

The score in the handicap event is as follows:

Banks, scratch11111111111111111111—24
Morley, 2110111111111100111111110—23
Dudley, 4111111111111110100111111—25

NEW UTRECHT GUN CLUB.

March 12.—To-day's events are given below. The scores in the club shoot for silver flask were as follows:

C M Meyer, A, 30*222201212—8	22120	5	2210—4
Dr Wynn, A, 300121221122—9	10212	4	22102—4
L Harrison, A, 291202221022—8	22210	4	12112—5
F A Thompson, A, 2522121122—9	11101	4	2211—5
W H Thompson, A, 281020122212—5
J N Meyer, B, 282221201011—8	2112—5	11220—4	..
P E George, B, 27010202111—7
A Eddy, B, 291210112211—9
W A Allan, B, 281112*10101—7
W H Shepard, B, 281212122221—10
Capt Kattenstroth, B, 2720*0202221—6
A Hegaman, B, 290122221222—10

Nos. 1 and 2 were sweeps at 29yds., 5 birds, high guns. The birds were of an uneven lot, but some of the duffers proved to be very strong when they got under way. Shepard's shooting was a feature. All Class B men were allowed one miss as no bird. Hegaman with his bird allowance tied Shepard for the flask, and both agreed to shoot one more bird, resulting still a tie. On the toss of a coin Hegaman won. Owing to the limited supply of birds the shoot was cut short.

The target grounds are now located at Woodlawn, and the first shoot at them will be held next Saturday, March 19. Traps ready 1:30 P. M.

E. G. FROST, Sec'y.

ROCKAWAY POINT ROD AND GUN CLUB.

Rockaway Park, L. I., March 14.—Herewith are the scores made to-day:

Jac Stoney, 38001101110101110010111010101001011101—24	10
S Pete, 25111101101011110111110111—20	6

M Bates, 3800001101101010001100000010100101010—14	0

The following averages include a number of star sweeps, the winner of each goes back 2yds.:

	Shot at.	Broke.	Av.		Shot at.	Broke	Av.
L H Pete....	159	152	.804	Jac Stoney..	145	86	.598
H Otten.....	189	91	.654	F Coleman..	72	39	.541
J Jones.....	119	75	.630	M Batz.....	58	20	.344

RIDGEWOOD GUN CLUB.

Brooklyn, L. I., March 11.—To-day the Ridgewood Gun Club, of this city, held its regular cup shoot. All shooters standing at 31yds., having won in prior events, were barred from winning in this. The event was at 7 birds, 50yds, boundary.

Neiderstein, 31yds., 5; Young, 28yds., 4; Chas. Wissel, 31yds., 4; Sands, 31yds., 7; Kunzweir, 28yds., 5; Schoelter, 31yds., 6; Wimand, 31yds., 5; Newberger, 28yds., 6; Wimand, 28yds., 6; Schmidt, 28yds., 1; Dickerman, 28yds., 4; Bermel, 31yds., 6; Hilgause, 31yds., 5; Martin, 31yds., 3; Welz, 31yds., 3; Liebinger, 28yds., 5; Zerwick, 28yds., 3; Merz, 28yds., 1; Brunnemen, 28yds., 1.

IN NEW JERSEY.

BOILING SPRINGS GUN CLUB.

On March 9 the Boiling Springs Gun Club held a shoot, the principal event being No. 7, that for the E. C. cup, at 15 singles, 5 pairs, expert rules. The birds were thrown swiftly as a rule, thus making difficult shooting. Mr. L. Harrison, of Minneapolis, Minn., with a handicap of 2, was the successful competitor. He displayed a very high order of skill.

Jottings on my Southern Round-up.

I USUALLY make a trip through part of my territory, starting early in January and returning home in beginning of March. This jaunt carries me through most of the Southern States and Texas, where I go to see my friends and incidentally to say a few loving words anent the Parker gun. Of course there is very little on these lines to be said, so much having already been said, sung, and whistled by 500,000 people more or less on that subject regarding that particular gun. Still none being so deaf as those who won't hear, it is just as well to keep ding-donging away, and sometimes with due diligence and perseverance one may convert a doubting Thomas; hence my ramble, my peregrinations commencing this time very near home.

At Louisville, Ky., I came face to face with the unpleasant fact that the old Kentucky Gun Club had vacated its pleasant, historic, and most accessible grounds, and that therefore the hospitality so freely extended to one and all by that splendid body of men would have to be dispensed in the future from some other grounds. It is with feelings of regret that this announcement is made because we all know how welcome any and all of us have been at the familiar old place, and while a club with so much wealth and unbounded enthusiasm can always find another location, yet the fact remains that in our memory will always dwell recollections of the championship events fought to a finish there, and the many enjoyable evenings spent seated about the grounds chatting on dogs and guns with a set of men who love sport for its own sake and who moreover are cosmopolitan enough to understand that we can't all be rich nor yet college bred men, yet we should at least be gentlemen, failing in which we ought to have the common decency to be as gentlemanly as we can, and let it go at that.

At Charleston, S. C., I had the pleasure of seeing Mr. John H. Murdoch, with whom I had a delightful confab on game, particularly ruffed grouse and partridges, on both of which he is a capital shot. Since the death of Mr. Bardin, his partner, Mr. Murdoch has not done very much field shooting, but is looking forward to better times ahead. Of course I saw the only Barney Worthen, who seems to be getting bigger and broader every year. There may be a few men in America who shoot targets as well as our Barney, but they are decidedly scarce, while a more modest, quiet, unassuming shooter it would be quite impossible to find. May his shadow never grow less. Messrs. Peterman and Swann were also "in evidence," the former shooting a terrific clip, almost abreast of Barney, and the latter so full of vim and vigorous talk that an hour in his company is equal to a good rub-down, or electric shock from a powerful battery. To properly appreciate and fully understand Mr. Swann you should be with him afloat; then and there he looms up like a pillar of fire at night, rendering the soft balmy atmosphere of his own sweet tropical clime aglow by his impressive, striking and phosphorescent remarks. Wait till you see him miss three or four straight targets. Depend upon it, his powder is always plentifully supplied with sulphur; be it black or nitro, that ingredient is ever well served. And yet, and yet if any friend is in need, whatever may be the emergency, where can he go for more spontaneous and certain relief than with our good friend Swann?

At Savannah, Ga., things were quiet; indeed since the most untimely end of the man whom all will be proud to call their friend—the man known and loved by all alike—the incomparable, late lamented George Cape—things in the shooting world have remained quiet, and so will for many a day. George Cape did not go in for very much trap-shooting; he loved a dog; he was a genuine sportsman outright and one of the most graceful finished shots afield that the writer has ever had for a companion. A man of immense strength and activity, he sauntered along from morning till night with that careless, easy, graceful stride that proclaims without further harbingering the trained athlete, the indefatigable pedestrian. No man could lounge about a club room, or saunter more leisurely along a boulevard than George Cape; but he was not deceived, he could wade in mud knee deep for hours and never turn a hair, or he could vault a fence like a college prize winner, carrying an 8lb. gun as though it was a feather, and shooting in that superbly easy, swinging manner which is just as natural to some men as it is for a duck to swim or a Spanish woman to walk. Be the rise where it may, or the angle never so acute, he never lost his aplomb. Every shot looked easy when he fired it; he never got twisted either in trying a backward shot at a darting snipe flushing from the rear, and we all know how hard that is when both legs are stuck fast in the mud or when cutting down a pair of partridges going in opposite directions through tangled vines and dense underbrush. He handled a gun in precisely the same manner as a finished billiard player does his cue, and I can still hear his merry, gleeful laugh when he missed a shot, or more often still when he made a "grand-stand" double.

As well Savannah has lost George Cape; Knoxville, Arthur Mead; Jacksonville, Bryan Taliaferro, who goes next to the great unknown; who goes next to join that trio and the millions and millions of billions though there be who have gone before? Mark me, predestined wanderer, be thou who thou wilt, seek these radiant souls and tell them we are impoverished by their loss, nor can we find others to take their places.

Of mere shooters the land is full to overflowing, but the gap between a shooter and a sportsman is wider than the chasm separating a Landseer or even a Michael Angelo from a white-washer smearing a fence.

So I say, and say it advisedly: "Brave souls, we miss thee, for of such clay was thine is the true sportsman made!"

At Montgomery, Ala., I expected great things; tremendous bags of doves loomed up before me, and I went on from place to place attentive to my work, yet with mind far away in the dove field near Montgomery. I at last arrived, so had my shells (I won't say how many), and so had my incomparable Whitworth steel gun. Furthermore, my afflicted hands and wrists were behaving pretty well, so all seemed to promise a great day at doves. Upon entering Mr. Westcott's store Tom Westcott came up with a sad long looking face, and to my joyful pent-up exclamation of "Semper paratus!" he simply threw up his hands and told me in his soft, sorrowful way that the doves had all left the baited field; that the shooting was knocked on the head. He further told me that our very good friend Mr. Jewell had ridden a full 100 miles on an engine to be sure that all was in readiness for the next day; to engage teams to take us from the little railroad station at 4 A. M. next morning; to see to our luncheon, etc., etc., and that as a precautionary measure and to make assurance doubly sure he had driven out to the field itself "just to see how many thousands there were," he said. Well, he did not see any. The man who had baited and guarded the field told him that no doves had been seen there for several days. so that settled it, and me and my most creamy, juicy, well loaded factory shells and my gleaming, blue-barreled, double-barreled gun, and my erstwhile stiff though willing wrists and hands—and all was well, barring the doves, and they too were well—well out of it; and so it goes. So we must wait until some other time and trust to luck to have a better report to make of the great dove shoot that was to have been near Montgomery.

Albeit I thank my friend Jewell, because I know his disappointment was keener than mine, and because he had done so much and in such a thorough earnest way to give us all a rattling good shoot.

At New Orleans I saw lots of things: one can always, if so inclined, see a good deal in New Orleans. Really outside of New York, why isn't New Orleans No. 2? or is it No. 1? I have a very dear chum there whose name is John W. Phillips, and of all the good fellows, bred-in-the-bone sportsmen I know, I cannot put one single one ahead of Mr. Phillips. He has the feu sacré to such an extent that were he deprived of shooting during the winter I think he would very soon be under the daisies. Indeed if he could not leave New Orleans methinks he would patrol those wide and deep ditches on either side of Canal street, hoping to flush a snipe or scorch on his wheel in early morning along the river bank in the hope of tumbling down a duck on its passée.

So we went to Abbeville, a splendid place generally, and one in which we have done well in other years. But it had rained a good deal and it continued to pour incessantly. The whole country was very soon under water, the snipe were banished, our fond hopes vanished, and we vamoosed the ranch, after being nearly swamped in our wagon several times or oftener. So the doves and the snipe had leagued against me, and nothing was left but to pull up stakes and say adieu to dear old John—and I hated to leave him, so I did.

Returning to the city from New Iberia, we were told a very pretty story, which I will endeavor to relate though I know full well that I cannot do it justice, as the surroundings, people, customs and climate have much to do with all such sentimental ditties. Well, it appears that long, long ago a patrician of France, a man who had lived in gay Paris for the most part and who had married one of the most beautiful women of that city, left his belle France and came to this flat, treeless country, and there bought an immense estate, where he lived for many years

a king on his own domain and monarch of all he surveyed. Coming from a country renowned alike for its beautiful trees and its most delicate flowers, the French grandee at once had many trees planted, forming a dense wood around his house, and long approaches lined with avenues of tall stately trees. One by one his children left him, some died, some settled in far away States, and then he lost his wife, so that of all the dear ones none remained—nothing but his trees. Finally becoming old and infirm, and yielding to the entreaties of a married daughter to come and make his home with her, he at last decided to abandon the old homestead, though with many regrets, for there his life had been spent, and all the good of it came from among that grand old grove of beautiful trees. So after having discharged his many and old faithful servants one morning he entered his carriage and drove away, an old broken-down, feeble, sorrowful man. Reaching a grand avenue of tall, magnificent trees he uncovered his head, bowing to each one as he passed it, and on reaching the end he leaned over, arose and said: "Adieu, mes arbres! Adieu, mes beaux arbres! Adieu, pour toujours"—Good-by, my trees! Good-by, my beautiful trees! Good-by forever! And a puff of wind sent from who knows whence, going who knows whither, caused the graceful, grand and perchance loving trees to bow their lofty heads and say adieu!

And so passed out of the Teche country never to return a grand old nobleman, leaving behind him a landmark that will endure for generations; and when some stifling day, after having enjoyed the shade and rest afforded by these his idols then the weary traveler may repeat with the patrician of France, "Adieu, mes arbres, pour toujours."

I have a dear, kind, and brainy friend, who some time ago moved from Shreveport, La., to Lake Charles in the same State, and to him I promised time and time again that I would check my baggage and camp with him a day or two, knowing full well that for me the latch-string of his cheerful, hospitable and genuine Southern home is always hanging on the outside of the door. So I left my very comfortable seat in the Southern Pacific sleeper and got out at Lake Charles. I had no sooner reached the door than I saw my shooting companion, Mr. J. C. Elstner, elbowing his way through the throng, eager to get at me, as I was at him. So of course we very soon met and had a good friendly handshake, and Jo told me all about his family and his dogs, and old Bess particularly, over which I had shot snipe before. Then incidentally he told me how nicely he was doing in his business, and that he was so "real glad" to see me, and all that, that I felt like an ingrate at not stopping off at his place long before. So driving along in his carriage we soon reached the hotel, and there were met by Monsieur Pierre Theaux, of the Howard Hotel, who assigned me to about the only vacant room he had, made me feel awfully jolly and quite at home instantan, and went up 100 degrees in my estimation forthwith by informing me he knew my chum Mr. W. Phillips, as he had often hired rigs and carriages from him formerly when there was good shooting about New Iberia, where M. Theaux had a livery stable. So we had supper, Jo and I made still more palatable by a bottle of good white wine thoughtfully sent in by Mr. Theaux. Of course we talked dog and gun (what else could two such chaps converse on intelligently), and made our plans for an early start the next morning in quest of snipe—if any—partridges for sure.

Somehow we did not get a very early start, indeed we got a very late one; nevertheless we managed by dint of good shooting and splendid work by the dogs to bag forty-seven snipe and quail and returned home long before 6 P. M. with the proverbial sportsman's appetite. On the way home we overtook a couple of men who had been out that day and killed some prairie chickens—I don't remember how many, eight or ten I think. Well, the sight of those big fine birds enthused me, and carried me back many a day and over many a mile to the vast plains and prairies of the Northwest, where I have killed so many hundreds and hundreds of them. So I determined to give them a trial on the next day, and being piloted by a professional hunter, whose name is Love—a very good man by the way, who knows all about that country—we started at 5 A. M. and drove off the reel fifteen miles out to the prairie only to find the grass all burned off, so of course that squelched all chances of game in that direction. However, I did get three, having shot at four during the day, one unfortunate going off with a broken leg and flying so far that, although over a level, treeless country, neither of us could mark him down. On this occasion I used my Whitworth steel Parker pigeon gun, full choke, and had in it factory-loaded U. M. C. trap shells, with 3/4 drs. Du Pont and 1 1/4 Tatham chilled 7s, 3in. cases. I can safely assert that I did not get a shot at any of the chickens inside of 40yds., and as the gun is pretty light on right trigger—much too light for a field gun—I invariably pulled it off before I was on my bird, so had to do the business with the left barrel. It was blowing a very stiff breeze, and yet with this small shot in such a high wind and at such a distance, it was remarkable how that gun and those loads killed stone dead these big birds, two of which were over 70yds. off. So I came back with my scant supply after a thirty to thirty-five mile drive, feeling all the better for the ozone.

Jo Elstner soon looked me up and we agreed to make one more day of it; this time starting early sure enough and going for quail principally, but snipe should we find any. So we put out at about 5 A. M., killed a few quail and were doing nicely when we saw an old rice field which was a very likely place for snipe. We tried it, and before we got over the fence up went several wisps, wild as hawks, but nevertheless snipe. So we hammered away. Jo soon ran out of small shot loads, and as I was using a 16-gauge gun I could not help him, but he stuck to it manfully and made some surprising long kills with No. 5 shot. On this day Mr. Roberts, cashier of the Calcasieu Bank accompanied us and used Jo's little 16 Parker, with which in his maiden effort he bagged seven snipe. When the bag was counted we found we had 107 quail and snipe, so as that was "a plenty" we drove home, and all voted it a great day for us. For my part what pleased me most was that my foot, which has been very painful for a long time, held me well up on that day and did not go back on the old man once. I also had a splendid opportunity of testing my heavy (7 1/2 lb.) full-choke 16-bore Parker gun, and a great shooter it certainly is. When we saw the snipe flushing in wisps and singly away off we knew that meant plenty of shooting and not too many snipe, so we at once dispatched the wagon back to town for more ammunition. As I had no more 16-gauge shells I had my hammer Parker pigeon gun sent out and some great loads, i. e., Smokeless, factory-loaded shells, 3in. long with 3/4 drs. Du Pont and 1 1/4 Tatham No. 8 1/2 chilled shot. That combination, take it all in all, guns and shells as so loaded, is hard, very hard, to beat, for a snipe especially. It was delightful to me to know that though so abominable a shot as I certainly am at targets, yet I gave a good account of myself on this extremely difficult, extra long-range shooting, which goes clearly to prove that my early training in the meadows at the north of France while at college there had not been forgotten; nor had the precepts of my beloved grandfather, than whom a better, more thorough sportsman never lived.

At San Antonio, Tex., I met a lot of old friends, but was sorely disappointed when my partner down there told me quail were scarce, and not in sufficient quantities to warrant going after them. But I could not leave the old town without having some kind of a shoot, so Mr. Geo. Chabot took upon himself the gathering of some pigeons. This he so successfully did that on next day at Fort Sam Houston we had a splendid time shooting at as good pigeons as one could find anywhere. I was struck and amazed at the magnificent shooting of Lieut. P. Whitworth, U. S. A., who, with small loads of Hazard, 3drs. in nitro shells, and 1 1/2 chilled No. 6 shot, did as fine shooting and made as clean kills as I ever saw in my life. He shot a Parker trap gun, with which I don't remember how many deer, ducks, geese, quail, etc., etc., he has killed this season, using the full-choked and also the cylinder-bored sets of barrels. Mr. Whitworth won the championship of Texas last year at San Antonio with that gun, and with practice would be an awfully troublesome customer anywhere and at anything. Capt. Foster joined us late in the day and made some very pretty kills. Mr. Chabot using a very small 24-gauge gun shot awfully well, while Mr. Gardner, when he got accustomed to his Monte Carlo stock appendage, did exceedingly good shooting. But any man who has left the army in good standing always feels homesick when he reaches an army post; there is a fascination about it that one can never outlive, and every bugle call left a mournful impression on my sensitive ears; every familiar army phrase kept ringing through my head, and I felt sad, for recollection instinctively carried me to that glorious old 7th horse—Custer's regiment—with which I put in such happy memorable days!

Messrs. Joe George and A. W. Adams left suddenly for the coast duck shooting, so I did not have the pleasure of seeing very much of them. Both were in good spirits, and I hope to see Mr. George at the Grand American Handicap.

At Dallas, Tex., I stayed but a very little while; still I was there long enough to shake hands with many of my friends, and to have a most pleasant shoot at 25 pigeons with Mr. Allen, of Allen & Glum, and he beat me at that, just to show there is no

ill feeling. But I will get at him again later and give him another chance.

At Little Rock I put up at the Capital Hotel with Mr. Joe Irwin, and there we had a regular set-to talk—dogs, ducks, snipe, woodcock, etc., etc., and guns; and I verily believe Joe Irwin is one of the very best hunters I have ever met, and that is saying a good deal, for my acquaintance in that field is legion.

At Memphis I struck the gang all eager and willing to shoot, and to know what a nice set of fellows shoot pigeons at Memphis one must go there and see for himself. Everyone was so bent on shooting that we went right at it hammer and tongs, and then some—well, Irby Bennett has improved to such an extent that it is surprising how soon some men learn to become good shots. On the day of the Memphis handicap, Feb. 22, he scored 23 out of 25, when really he ought to have had his last bird, which though knocked down got up and flew out without even the excuse of having any one or anything to chase him; just a natural, pure cussedness kind of pigeon. Memphis, among other very good things, is the home of Mr. A. H. Frank, the man who captured the Memphis handicap first alone, and who since using his new Parker has scored 107 out of 111 pigeons shot at all told, standing at 29yds., and many at 30 to 34yds. Mr. Frank Poston was unable to take part in the shoot on Feb. 22, owing to the severe illness of his aged mother. When Poston and Frank cross their Parkers fur will fly, even if a few feathers fly out too. But that will be an interesting match to behold. Judge Walker, though, won't be far behind, if at all; and then Mr. Edgington will keep things very warm, while Dr. Saunders, who shoots quite as well as ever, will keep them all guessing. Leastwise don't forget Dr. D. Weaver, he clings to you so hard and works so awfully in dead earnest too—bad medicine that! Brother Allen will soon be at it again, so there's no telling what those Memphis men will do. And if any more of them improve like Irby Bennett and Abe Frank any one going down there to get their money will have to be Jim Dandy, or lose, and the chances are he'll lose.

So I drifted back to my old own gun club at Louisville, Ky., and there for the first time shot at some pigeons that seemed as fast, or nearly so, as they do at Westminster Kennel Club; and that in my humble opinion is the end of the rope.

It appears the Kentucky Gun Club has made permanent arrangements to hold its tournaments on a bicycle track in an inclosed ground, and when I know more about it I will forthwith enlighten my readers on this most interesting subject.

To-morrow I leave for Boston, where the old gun and I will stand together on the same platform, when I hope we may make a favorable impression, my part of the performance consisting merely in telling people what they already know—i. e., that there are guns and guns, but that the Old Reliable just goes on forever.

GAUCHO.

Audubon Gun Club.

BUFFALO, N. Y., March 5.—The main event of the club's weekly shoot to-day was the badge shoot. In Class A E. C. Burkhardt and L. W. Bennett tied, Dr. E. S. Carroll won in Class B.; J. E. Lodge in Class C. No. 8 event was at live birds. The scores were:

Dansville Gun Club.

DANSVILLE, N. Y., March 4.—The Dansville Gun Club held its regular practice shoot to-day. The day was pleasant, and seventeen members faced the battery of the traps arranged after Mr. Sergeant's system of throwing targets at unknown angles. The boys seem to catch on to this way of shooting quite readily, as our club average jumped from 47 per cent. last week to 53 per cent. to-day, the second time of using the system, as the following scores will show:

Events:	1	2	3	4	5	6	7	8	9	10	11	12

WILLEY, Sec'y.

Worcester Sportsmen's Club.

THE annual banquet of the Worcester Sportsmen's Club was given at the Bay State House, Worcester, Mass., on the evening of March 2. At the appointed time, 8:30, the dining room was opened and the banquet began. Three tables were required for the party. President Maynard P. Roach, with the toastmaster and speakers, occupied the head table, which was decorated with the trophy of Shooting and Fishing and that of the Hunter Arms Co. The toasts were most felicitously responded to. The members and guests present were: John B. Tougas, Jay Snell, George S. McClellan, E. T. Whittaker, E. W. Ide, George A. Davis, William L. Davis, C. W. Walls, M. D. Gilman, Dr. Edward E. Frost, Elisha Knowles, Alderman B. W. Potter, Joseph K. Greene, Maynard P. Roach, Rev. Roland A. Nichols, A. B. F. Kinney, William A. Blaisdell, William A. Tierney, H. H. Gabeler, B. J. Bertels, Charles E. Forehand, C. Arthur Hanson, R. C. Walls, W. M. Buck, A. M. Walls, Sullivan Forehand, F. M. Harris, E. W. Buck, J. Walter Davis, O. M. Ball and F. Bucklin.

The new officers elected are: President, Maynard P. Roach; First Vice-President, A. B. F. Kinney; Second Vice-President, Elisha S. Knowles; Treasurer, F. M. Harris; Secretary, A. W. Walls; Executive Committee, George McLellan, C. E. Forehand, C. A. Hannan and W. H. Buck.

The Treasurer reported about \$150 in the treasury. The executive committee was authorized to arrange shoots and contests for the coming year.

Bison Gun Club.

BUFFALO, March 5.—The first event was at 10 live birds, \$5, with the following scores: Stacy 7, Mack 7, Woodbury 6, Heberd 8, Swope 6, Bauman 8, Beck 8, Cooper 10, Alderman 7, Wheeler 9, Ditton 9. In a 5-bird event Bauman and Ditton killed 3. March 9.—The following scores were made to-day:

Events:	1	2	3	4	5	6	7
Targets:	10	15	25	5	10	10	10
Mack.....	9	11	20	3	7	8	..

Foxie.....
Wheeler.....

Event No. 3 was badge shoot. The winners were as follows: Foxie in Class A, Ditton in Class B, Schrier in Class C.

While the attendance was not large and the day perfect for target shooting a general good time was enjoyed by all. Sec'y.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, MARCH 26, 1898.

VOL. L.—No. 18,
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

If a man walk in the woods for the love of them half of each day, he is in danger of being regarded as a loafer; but if he spends his whole day as a speculator, shearing off those woods and making earth bald before her time, he is esteemed an industrious and enterprising citizen. Thoreau.

REPEAL SECTION 249.

THE purpose of the New York game law to forbid and prevent the destruction of game by market hunters in the close season is in large degree nullified by the operation of Sec. 249, which reads as follows:

Sec. 249. No person or persons shall be deemed to have violated any law or ordinance by reason of his or their selling, exposing for sale, transporting or possessing, or attempting so to do, the body or a part of the body of any wild animal or bird in the close season for such animal or bird, provided it be proved by him or them by production of proper invoices and freight or express receipts, that such wild animal or bird was shipped from a point at least three hundred miles distant from the State of New York. For the purpose of the proper enforcement of this section the package containing this wild animal or bird shall be marked plainly "game," and the place of shipment and destination shall also be plainly marked. All transportation companies which shall transport the same shall keep books plainly showing the receipt and delivery of such packages of game, and dealers in the same shall keep books of account showing the number of birds or animals received, sold or delivered by them, and shall, at all times, permit any authorized agent of the Commissioners of Fisheries, Game and Forest to examine their books of record for purpose of establishing the right of such possession or transportation in close season.

The practical working of the provision is to open the market of New York city and of lesser towns throughout the State to an illicit traffic in game the year around. The results of this are twofold; one is the wrong and injury inflicted upon the game interests of New York State; the other is the wrong and injury inflicted upon other States.

The proposition has the force of an axiom with those who understand these matters, that so long as there is an open market for the receipt of game the supply will be furnished to meet the demand. A law which permits the sale of game outside of a 300-mile limit opens the door wide to trade in game killed in our own covers. This is not theory; it is the demonstration of practical experience. The 300-mile limit is a blind for traffic in New York game. No system has ever been devised or will ever be devised which can efficiently conserve our game resources in the face of an open market law.

The New York open market is a standing source of wrong to many other States because it encourages the shipment of game from those States in violation of their statutes and contrary to their interests. New York markets are the dumping grounds for game forwarded by the market hunters and commission merchants of the West. Throughout the West non-export laws very generally prevail; and the system is extending. The Eastern markets constitute the gravest problem involved in the enforcement of a non-export law. With those markets closed the operation of the laws would prove comparatively simple. This is recognized by game commissioners and wardens and executive agents. In a recent convention of these officials in Chicago resolutions were adopted to petition the Legislature of New York to modify the law, and thus do its share in solving the vexed problem of protection. There should be among Senators and Assemblymen at Albany a sentiment of State pride potent enough to relieve New York of the unenviable character it now maintains as a fence for stolen goods.

If the honest conviction of the Legislature on the subject were expressed in the disposition of the Weeks bill to repeal Section 249, the measure would become a law. More encouragement is afforded just now that the law may be repealed than has been given at any other juncture since the section found its way by trickery upon the statute books. Mr. Weeks' repeal measure has passed the Assembly; it is expected to pass the Senate. If it shall reach the Governor, every influence

should be exerted to show him the righteousness of the repeal, and insure his approval of it.

POTOMAC RIVER POLLUTION.

THE executive committee of the Game and Fish Protective Association of the District of Columbia met on Wednesday, March 16. The preliminary report of Mr. Talbott, Chairman of Committee on River Pollution, was presented, approved and by unanimous resolution made the basis of a memorial to the United States Senate in support of Senate Bill 2,905, providing for the investigation of the pollution of rivers where the sanitary condition of the people of more than one State or Territory is affected.

The memorial is signed by W. S. Harban, Chairman; W. P. Young, Secretary-Treasurer; Richard Sylvester, Warden; I. Walter Sharp, Rudolph Kauffmann, Joe H. Hunter, Frank B. Curtis, Charles H. Laird, Harrison Dingman, Jesse Middleton and DeWitt Arnold, Executive Committee of the Association.

On March 17 Mr. Vest laid the memorial before the Senate, and it was referred to the Committee on Public Health and National Quarantine having charge of the bill, and was ordered to be printed.

There is hope now that if Congress will but take steps toward the prevention or regulation of pollution, or its investigation only, it will encourage the friends of the rivers and fish throughout the States to renewed efforts in favor of reform. If a general movement can be inaugurated, if only in the direction of study, a great work will have been accomplished.

The committee's report includes a communication from the United States Fish Commissioner on fisheries destroyed or injured by pollution; a letter from Prof. F. H. Newell, Chief Hydrographer for the Geological Survey, whose valuable report on the Potomac River has just been published by the Senate (Doc. 90); and a paper by Dr. George M. Kober, formerly Special Sanitary Inspector for the City of Washington, which treats of pollution from the sanitary standpoint.

GAME SUPPLY FLUCTUATIONS.

THE astounding success which has attended efforts toward the artificial reproduction of fishes have led many a man to wonder why attempts to artificially propagate birds and mammals might not be attended with like success. As yet, however, not the first step has been taken in this direction. We have learned much about the destruction of game and a very little about the way in which it increases in a state of nature. This is all. Except in preserves, the end of most of our large game is very likely in sight, but the case may be very different in respect to feathered game. As we have more than once pointed out, in many localities the numbers of any species are likely to sink very near to the vanishing point, and then, in consequence of the failure to pursue it, owing to its scarcity, it may increase again. Any marked increase, however, will be followed by a renewal of pursuit, which will again be abandoned as the numbers again diminish. Such fluctuations may continue for many years. Meantime it is to be hoped that our game laws may be improved and better enforced; that exotic birds may be introduced in constantly increasing numbers; that the sale of game may be prohibited.

A familiar example of what may be done by the protection of exotic feathered game, where all the conditions are favorable to its increase, has been seen in the development of the Asiatic pheasant on our northwest coast. Nineteen pheasants were turned loose on Vancouver Island near Victoria in 1881, and having been rigidly protected for five years, increased in that time so greatly that it was estimated that during the first open season a thousand birds were killed without any perceptible decrease in the numbers of the pheasants. The next season a still greater number were killed, but during the open time the birds which at first were very tame had learned to regard man and his dog as enemies, and had become much more shy and far better able to take care of themselves during the shooting season.

While the fluctuations alluded to will always be most noticeable in the case of feathered game, the principle applies to mammals as well; although, owing to the slower reproduction of large animals, the increase is more gradual and less readily seen. With the settling up of a new country predatory beasts are in large measure killed or driven off, and thus the numbers of the natural enemies of any other species are greatly decreased. This ob-

viously tends to lessen the destruction of that species, so that if it were not for the killing by man its numbers would markedly increase. This very thing is occurring to-day in the case of elk in the Yellowstone Park, where, in many places, protection is absolute, and the death of animals occurs only from old age or injury by accident. So great has been their increase that persons familiar with the Park say that in winter, when the ground is partly covered with snow, the bare tops and sides of the hills, where only the elk can graze, are so closely fed down and so cut up by the hoofs of the animals that numbers of the elk perish from starvation.

A few years ago in portions of Maine and the Adirondacks the beavers were thought to be exterminated, but the few survivors—protected by the very paucity of their numbers—have so far increased that in some places they have become a most interesting feature of the life of the woods. In early days the Galapagos Islands were a favorite resort and breeding ground for a species of fur seal which occurred there in great numbers. As has been the case with the fur seal wherever its rookeries were discovered, it was pursued down to the last animal, and for several years has been thought to be absolutely exterminated. Yet a few survived, and in the year 1897 their numbers had so increased that not less than 230 skins were taken by a commercial sealer.

The tendency of nature is to reproduce her species, and this tendency can only be overcome by the constant interference of man, whose whole efforts are devoted to fighting nature. From examples such as have been cited above, the game protector may learn many a lesson and derive much encouragement.

The supply of Norwegian reindeer moss brought over with the last consignment of reindeer ran low before Seattle was reached, and the question arose as to what the animals should be fed. In this dilemma Mr. L. S. Kelly, who was with the reindeer, suggested that they be tried on alfalfa clover. The suggestion was acted on, and the deer took kindly to the clover. When they reached the coast they were taken to Woodland Park, a few miles from Seattle. Here they are turned out to graze and enjoy the green clover. When first turned out they rushed into the lake and swam out a long way from shore. They are capital swimmers, their broad, spreading hoofs enabling them to make good headway. The animals are interesting, but it was never other than a waste of money to import them, as has been done and for this purpose.

We gave last week a comprehensive outline sketch of the magnificent exposition given by the New England Sportsmen's Association, and now in progress. To-day we add notes on some of the many features. The Mechanics' Building is to Boston what the Madison Square Garden is to New York; and the Association has brought together within its great halls such an aggregation of attractions for sportsmen as has never before been seen under roof. Those to whom we owe the inception and execution of the enterprise are deserving of the warmest congratulation for its liberality of scope and perfection of detail. It is a genuine, dignified and altogether creditable achievement. Boston has set the mark by which all future sportsmen's expositions must be measured.

It was inevitable that the New York and Boston shows should be contrasted; but between two enterprises so distinct in purpose and character comparisons may hardly be made. The New York show was primarily and almost exclusively a trade exhibit of sporting goods. The Boston show was in its original purpose and is in realization an exposition of the sportsmen's side, the field and lake and forest and camp; the trade features do not dominate. It is understood that the New York shows have been profitable to those interested in them. The great success of the Boston show was assured from the first day.

In our issue of March 12 we alluded to a widely copied newspaper story, purporting to be told by a retired army man, of a Sergeant Richardson, who was credited with having killed in February deer and elk in Maine. The Game Commissioners of that State have investigated the story, and have proved it to be a wholly baseless fabrication. This sustains the opinion we expressed at the time, that the yarn was spun of imagination. As for Sergeant Richardson, there is such a person, but at the time, instead of being off shooting, he was chained to business at Fort Popham.

The Sportsman Tourist.

Some Yukon Notes.—I.

ONE of the main attractions which drew me to the Yukon along with the rush of gold seekers last fall was the prospect of hunting. I had seen the skins of the big brown Alaska bears measuring 12ft. from paw to paw, and nearly as much from nose to tail, and I knew that caribou and moose and other game were also on hoof in the country.

The two record-breaking moose heads which FOREST AND STREAM told about last year had much to do with my journey.

As a matter of fact, however, the big bears and the big moose are chiefly confined to the coast country, and the mountainous barren waste lying along the upper Yukon watershed has little to attract the sportsman. Game is nowhere abundant, and what little there is is hunted to death. The coast, on the other hand, still affords some magnificent sport, and a trip to Cook's Inlet, for instance, would insure good hunting and unique trophies.

Owing partly to the scarcity of game and partly to the exactions upon my time, first to get into the country and then to get out, my hunting ambitions were never realized. I got no game except a few ptarmigan, grouse and ducks, two timber wolves, and some fur. I talked with Indian and white hunters, however, and made personal observations, and in view of the public interest in the Yukon at the present time, some notes on the game may not be without value.

Beginning with the passes which lead to the headwaters of the Lewis (to all intents and purposes the Yukon below Tagish on this route), by far the most abundant game is the white goat. In August and September goats were seen daily from the trail, in places where it skirted the upper edge of the timber; and though there was little if any systematic hunting, a number were killed by men who chanced upon them. One was shot in this way by a packer on the hog-back mountain on the main trail between the last bridge and the ford. This man told me that the goat let him approach with 30 or 40yds. It was killed only a few rods from the trail.

Another was killed by a man named Johnson, grubstaked by Howard P. Curtis, a young New Yorker, who has since acquired a number of claims in the Klondike. Johnson was sick in bed at the time in a tent just above the Second Bridge over the Skagway. He saw the goat on the almost vertical hillside above, and lying in bed killed it at a distance of several hundred yards. Curtis and others of the party secured the skin the next day.

Just above the Ford one day I noticed two men laboriously climbing the bare rocky hillside opposite. Something in their movements told me they were hunting, and scanning the rock above, I discovered the object of their quest—a big goat standing out in plain view at the top of a perpendicular ledge. The goat was watching the hunters attentively, and seemed fully aware of the situation. When they got within a quarter of a mile he wheeled and darted up the mountain at a pace that was in the sharpest contrast to the slow, clumsy progress of the men. Usually it is folly to attempt to stalk a goat from below. From the hog-back before mentioned I saw two small black bears one afternoon on the mountain opposite. All along the trail horses and men were toiling—the horses dumbly patient, the men voluble in their disgust.

Practical profanity aimed at horses and mud attained its highest development on that trail. Its picturesqueness was only exceeded by its volume. Two hundred men within a very short distance were swearing at the full capacity of their lungs, their remarks punctuated by blows of the cudgels they carried on horses' backs or the clatter of iron-shod hoofs on ledges of bare rock. Yet, despite the fact that the air was very still, and every sound carried across the cañon gorge of the Skagway, as I found afterward from personal observation, those little bears paid not the slightest attention to the rumpus. They were peacefully engaged in scooping the watery moss berries and pulpy blueberries into their mouths, and were minding nobody else's business.

Soon the bears began to attract attention. They were pointed out for a mile along the trail. Some persons called them grizzlies. They were nearly a mile off, but this did not prevent one man from shooting a box of cartridges in their general direction.

Two hours later I had closed a contract for some packing, and having an hour or two before dark at my disposal, I took my rifle and climbed the hill where the bears had remained in sight up to the last few minutes. It was a tooth-and-nail scramble up from the cañon to a bench where grew a belt of timber perhaps a quarter of a mile in width. Above that the mountain was bare of vegetation except for low bushes, and very steep and ledgy. In the timber I found abundant signs of goat. The spoor was everywhere, and wherever there was a natural pass between rocky ledges tufts of white hair were caught in the trees. Judging from appearances, the signs had all been made the winter before, and there was nothing to indicate that the goats frequented the timber in summer.

I circled round in the timber to get a position to leeward and above the bears, but my trouble was in vain, for when I reached the spot they had disappeared; and though I threw stones into all the neighboring gullies I could not start them.

Fresh goat trails were numerous on the mountain side, in plain sight and hearing of the noisy crowd on the other hill; but like the bears, the goats seemed to pay little attention to the influx of strangers to their chosen country.

Bears were common all along the trails over the passes, and were the subject of many good stories. One very large brown bear dragged away the carcass of a horse entire near the foot of the first hill, and was wounded the following night by hunters lying in wait. One of my partners saw the tracks and blood of the

bear, and also the partly eaten carcass of the horse, and the trail along which the bear had dragged it.

When the time came for our descent of the river the bear season was nearly over, and most of the provident ones had already found for themselves winter quarters. Just above Lebarge, however, while trying to head off from the shore a black fox which we had surprised on a sandbar, we came upon the tracks of two very large bears. The fox, it may be as well to state, reached the river bank behind the shelter of a point and escaped, though a few seconds more would have given us an excellent shot at short range. The tracks of the bears were between 12 and 14in. long, and showed very plainly in the new snow. The date was toward the last of October.

Coming out on the ice last month, I met a party who had camped at White Horse Rapids along with us the day before seeing these bear tracks. Messrs. Henning and Campbell, of this party, told me that they had killed a large grizzly bear ten miles or so above the point where we saw the tracks. They reached the Takeena River about noon of the day they left White Horse, and finding the river running much ice bank full into the Lewis they landed to investigate. While on shore they sighted the bear swimming the river amid the ice. They hastily got into their boat and gave chase, but though the bear was carried a long distance down stream by the current and ice, they were unable to come close enough for a shot before the bear landed. They followed his track, however, and soon came in sight of the bear, which for want of a better opportunity Henning shot in the tail. As the bear turned, another lucky shot in the neck severed his spinal cord and killed him. Henning, who is an old Rocky Mountain prospector, said the bear was a genuine grizzly, and weighed about 600lbs. Campbell has the skin, but as he had left it at his cabin down river I did not see it.

Gov. Walsh told me of another grizzly killed by the Tunnies and Breed outfit near the island (Richtofen) in Lake Lebarge. The bear was first seen on the shore of the island. When the boat, containing ten men, came opposite he deliberately took to the water and swam toward them. They opened fire on him at short range, and had all they could do, they said, to keep the bear out of the boat. When only a few feet away he turned and swam back to the island, and succeeded in getting entirely out of the water before dying, though a post-mortem revealed thirty-two bullet holes in his hide. Gov. Walsh saw the skin, and assured me that it was a grizzly. In his long sojourn in the Northwest as chief of the Canadian Mounted Police the Governor saw and killed a large number of grizzlies, and consequently speaks with authority on the subject.

Just across the divide from the ocean, near Middle Lake, I saw the tracks of both moose and caribou in September. Several caribou were killed a little later by the Indians near Lake Lindeman. Caribou were seen on several occasions on the west shore of Middle Lake, but as far as I know none were killed at the time I was there. I saw moose tracks crossing some open glades in a thick willow growth just above a belt of fir timber on the mountain west of Shallow Lake, and running south from there to Middle Lake.

The chief engineer of the surveying party who were locating the route for the railroad through White Pass told me that at Lindeman he had seen two moose.

Half a dozen men told me they had seen elk at various points just north of the summit, but I am inclined to think that what they saw were either moose or caribou, as I cannot find that elk exist much further north than Vancouver Island. It was also commonly reported that mountain sheep were found in this neighborhood, but on talking with men making this statement I always found that they referred to the white goat. Goats, in fact, were more often called sheep than given their proper name, and Sheep Camp, now a prosperous little city second only to Skagway and Dyea, owes its name to this popular misapprehension.

Sheep there are along the upper Yukon, but they inhabit a country better adapted to their requirements than the humid coast range. They are found in a high plateau country abounding in buttes and grassy sandhills, lying between Lake Lebarge and Lake Teslin, at the head of the Hootalinqua. A party of prospectors who wintered on the upper Hootalinqua a year ago brought down the river with them the heads of several "big horns." Mr. H. H. Pitts, the storekeeper at the Pelly, measured one of those heads and found that the horns at the skull had a circumference of 16in. Mr. W. MacIntosh, who is wintering at the foot of Lake Marsh, and who crossed to the Hootalinqua via the McClintock River on a prospecting trip recently, told me that the Indians reported sheep plenty about Teslin Lake. He said they described the sheep by making a circular motion with their hands on both sides of their head, saying: "Horn all the same as this." They said the meat was "good mucka muck," while goat was "no good." At Lebarge the Indians also told me that sheep were plenty ("hai-yu") just east of the lake, and they traded some fresh meat purported to be mutton, and which certainly tasted different from the moose and caribou we had been getting.

There are no goats in the immediate neighborhood of Lake Lebarge, or, for that matter, on the river below. In the interior the mountains are too low, and with the glaciers of the coast range the goats seem to disappear. At the Pelly the Wood Indians (or Yukon, as they prefer to call themselves) had some goat skin muckluks procured in the course of trade from the Chilcoot (coast) Indians. Curiously enough, while they professed ignorance of the animal, they used the name "sheep" to designate it. These muckluks were made from kid skins. Ptarmigan inhabit about the same range of country as the goats. I heard of none on the main river below Lebarge. Barnes, the constable in charge of the Northwest Mounted Police station at the foot of the lake, told me that they were fairly plenty in the immediate neighborhood. Mr. H. P. Curtis killed a number at the foot of Lake Marsh, and at Tagish they are reputed to be plenty. They are not found in these localities in summer, however, and one has then to go nearly to the snow line to get them. J. B. BURNHAM.

[TO BE CONCLUDED.]

Camp of Two Cranks.

White Water River, Indiana.

(Continued from page 223.)

Next morning we took five catfish from 10 to 15in. long off the set lines, but no turtle, which was a disappointment, as we wished especially for a turtle to make a stew or soup for the Sunday dinner. It may have been a little late in the season for turtles—I never studied up much on turtles anyhow—and we laid our failure to get one to the season, and it served to pacify our feelings as well as a better reason might have done.

However, one of the hooks was straightened out, and Tom was sure it was done by a turtle or a "whoppin' big cat." One circumstance we couldn't account for was the evening before we had tied on bright Cincinnati bass hooks and now they were every one as black as ink. We haven't accounted for it yet.

We baited the hooks again and left them out, and took off three more catfish when we came in to get dinner.

After breakfast we went down to the wide water, where the old boat lay, to try for the big bass that got away, and if Tom got him I had about made up my mind to sneak off down the river to town and take the first train for home, for if he got that bass there would be, as Dick Mac would say, "No sich consistency as livin' with him." I would never hear the last of how he caught "old Hickory's big bass."

When I opened the bucket to get a minnow I found old yaller dead and stiff; the two cyclones he had passed through the day before had undermined his constitution, and he had passed quietly to the "beyond." I hooked on another big chub—we were after big fish—and both of us fished for near an hour, casting up and down along the willows and bushes lining the bank, and far out into the stream, reeling slowly in at times and casting again and again, but it was of no avail; the big one wouldn't bite; he had more than likely sprained his jaw in the encounter of the day before and was doubtless lying somewhere under the bank nursing it and wondering what the big chub was loaded with.

The spirit moved me to go prospecting, and I meandered off down the river for a half mile, fishing two or three good-looking holes on the way, but I got but one bass, and meandered back again to try for "the big bass of Riggles' Bend." I sent in my card in the shape of a big lively chub, but he was not at home, or was still in hiding, and I went around to where I had taken the darlin', and in a few minutes had another fair-sized bass on the stringer. Failing to get another in a half hour's fishing, I went on up the path and found Tom sitting on his favorite rock at the lower crib, motionless as a blue heron, waiting for some giddy minnow or unwary frog to stray inside of the "dead line," and with an expression of patient enjoyment on his face that was good to look at.

Just below him, holding down another rock, was a brother of the rod who, as I learned, had come over in his buggy from a couple of miles east for a quiet Saturday's fish, and he and Tom had struck up a fishing acquaintance, as is inevitable in such cases, and were of course on the very best of terms. I was duly presented by Tom to "Mr. Park Bradway," and soon gauged him as another "way up" crank; a quiet, unassuming, unostentatious gentleman whose ways and demeanor reminded me very much of my old comrade Dr. Elliott, of Lodi, O.

I selected another uncushioned rock near by, and we sat and talked and fished, and fished and talked till it was time to go up to camp and start a fire for dinner. An invitation to "jine" was politely declined by Brer B. on account of having a lunch with him, and not wishing to intrude on and be a bother to us, as he put it. I went to camp and started a fire and got the dinner going, leaving them discussing the merits of different kinds of rods, and waiting for a bite. Bradway had told us that he once took forty-five bass in a half day's fishing right at that spot without moving roft., the water was clear, however, and with this weighing on his mind it took several calls to pull Tom from his rock when I had dinner about ready, and I believe he would have sat there till dark if he hadn't been moved by hunger to come up and join me at dinner.

Tom can sit longer on a rough rock or log without abrading the nap on the rear of his corduroys and fish with more expectant determination, heedless alike of sun or rain or cold, than any disciple of gentle Ike that I have ever been out with. He's a marvel of patience and endurance, and even-tempered in all weathers; some more reasons why I like Tom.

He set his rod, leaving Bradway to keep an eye on it, and came up to camp, and we ate dinner and went back to our fishing; Tom to keep Brer Bradway company and cogitate over those forty-five bass, while I went on below to the old boat for another possible interview with "the daddy of the pool." I have noticed that there is an inexplicable influence that draws old anglers back to the place where they have taken or lost a big fish, be it bass, trout or maskinonje, and it is of no use to try to resist it; I never resist. I didn't get the big one, nor any little ones, and after fishing near an hour without getting a bite I went back up to the crib to sit a while with Tom and Bradway. We put in most of the afternoon here, taking seven or eight bass, of which I got none, and Tom chuckled some more, "the graceless cuss."

When it was time to go up and make preparations for supper, Bradway went along and on up the stream to his horse and buggy and for home, promising to come back next day and catch the big bass.

Tom and I got supper, and rebaited the set lines, with the sole object in view to catch a turtle; we wanted that turtle for a special purpose. The next day (Sunday) was to be our last in camp, and we sat late that night in front of our last camp-fire and planned for the wind-up.

Our friend Geo. H. Smith, assistant general passenger agent of the C., H. & D., had promised that if nothing interfered with his plans he would come up that night, stop at the Commercial, and come up to camp early in the morning and spend the day with us. We wanted to surprise him with a camp dinner that he could talk

about the rest of his days; hence our yearning for that turtle.

After going over the set lines next morning, and finding no turtle—only three or four cats—I went up to the farmhouse and neighbor Riggles and the old house dog swooped down on a fat young dominick rooster in a corner of the chicken yard, and I carried him down to camp to take the place of the turtle that we didn't

and stuck to it till we were just too full for utterance, and never was a dinner better relished, the only drawback being that we had no company to help us out, for Bradway was too intent on his fishing or too modest to come up after several more "hollerin's" for him.

I have eaten chicken stews, venison stews, rabbit, squirrel, grouse, goose and divers other kinds of stews off and on for a matter of fifty years or more—some

branch at home in which he kept a good supply of minnows during the fishing season, and we gave him all we had left—about 150 in all—to take home with him to remember us by, and after a brotherly shake all around he took his way up the river through the corn to his buggy at the head of the field, and that was the last we saw of Brer Bradway, but we will always remember him as a quiet-mannered, gentlemanly and companionable comrade to be out with along a stream.

Tom and I sampled the stew again—we couldn't hold much more of it—washed the dishes and started in to pack up, wondering the while why our friend Bill had not put in an appearance during the day.

When everything was ready and our fish packed in a big chip basket that we had brought along full of delicacies, we were loth to leave the place where we had passed four such happy days, but the sun was down and it was time to think of getting the outfit out to the road, and if Bill failed us we could likely get neighbor Riggles to take us to town.

Out at the road we sat on the big canvas bag and smoked and waited for Bill till the dusk of the evening came down on us, when to our relief Landlord H. himself came along, and we were soon on our way to town.

On asking why Bill had not come up after us, he said that "on the money we paid Bill for the minnows he got gloriously and hilariously drunk and was laid up somewhere for repairs and trying to reduce the size of his head to conform to the number of his hat." He said also that he had "fired" Bill and told him not to come back, but I trust that the natural kindness of his heart prompted him to reconsider his action after we were gone, for Tom and I took it to ourselves that we were in a measure responsible for Bill's swelled head, although he had got no "licker" at our camp. (Bill had said down in town that "the ole gray-headed feller up at the camp was a purty good sort of an ole chap, but he didn't have no licker along.")

Alas, poor devil! Like many another good fellow, he couldn't stand prosperity, even though it came to him only in the shape of a measly dollar or two. We felt only sorry for Bill, but our sympathy was doubtless wasted, for had we given him a \$5 or \$10 note he would have been drunk that much longer, and it would have required the waste of a corresponding amount of sympathy to even the case up.

We got home about 11 P. M. that night and went to business next morning with a new lease on life, for we had enjoyed our trip to the full measure of our capacity and notions of solid comfort, albeit we didn't get many fish, but enough for our needs and a few to bring home. Tom caught the most of them, and as a consequence snubs me and chuckles over it at every good opportunity.

The only way I can squelch him is to remind him of the "darlin'" which both he and Bradway conceded would weigh 3½lbs., and had I only saved the big one that got away, his peace of mind would have been utterly destroyed—till he caught a bigger one.

But Tom and I will never have a misunderstanding about the fish we take; our ideas of sport and our tastes run too much in the same channel for that; we both

get. I didn't keep him long in suspense, but cut his head off with the hatchet; and then took place a circus that was something astonishing.

After the manner of most chickens with their heads cut off, he began to flop and jump, and turn somersaults, having, as it seemed, the muscles of a kangaroo in his legs; and soon he was thrashing around in the weeds back of the tent, and then back he came, zigzagging in aimless leaps toward the fireplace, and before I could intercept him he went sailing over the bank into the water.

He kept flopping till he was 20ft. or more out from the bank, and then lay quiet—"must 'a' drowned," I reckon—and then I was in a category as to how to get him ashore. I had to scratch my head a few times before I could formulate a plan, and then I took my rod, and at the second cast dropped the line over him, and reeling slowly in till the hook caught in the feathers towed him gently down to the wash stand, and landed him with a shout that brought Tom up from his rock below to see what had happened.

When I explained the episode to him, he remarked, with the inevitable dry chuckle, as he started back to his rock, "Well, Hickory, if you can't catch bass, you're at the head o' the class at snarin' dead chickens," which moved me to sail a club after him to hasten his movements, but he dodged it and went chuckling through the bushes, to appear a minute or so after at the crib below anchored complacently on his favorite seat.

Lest some doubting Thomas (not Tom Smarr) may think I don't know how to prepare a chicken for the pot, I will say that I soured that rooster into the camp kettle two-thirds full of scalding water, when, after the proper amount of gyrating and twisting, I yanked him out, and sat down on a camp stool and picked the feathers off clean, and then singed him in the blaze of the fire, as provided for in the regulations. Then I split him open on the back with the hatchet, disembowled him and cut him up secundum artem—that is, with the hatchet and butcher knife—and the job was done, and the remains ready for the post mortem by Dr. Tom, who had promised to convert him into a stew that would lay all the chicken stews of ancient and modern times in the shade.

I hived the dissected rooster in a tin pan, covering it with another to keep flies and bugs out, and Bradway coming along just then we went down below to fish a while, he joining Tom at their "forty-five bass hole," while I went on down to the wide water to have another try for my big bass with the sprained jaw, Tom and Bradway conceding that according to angling ethics I was entitled by right of discovery to the first cast. I got nothing in a half hour's fishing, and went up and joined the other two till it was time to go up and start the stew to brewing.

Friend Smith had evidently slipped a cog or missed his train, for he didn't come, and he "missed the chance of his life," as Tom said.

I built a fire just to Tom's pleacement, and he put the chicken in the camp kettle half filled with water, sat it on the iron bars and "let 'er go" till it came to a boil, skimming off the scum as occasion required. He cut up some bacon into small squares, sliced a couple of potatoes, chopped fine a half of an onion, chucked all in the kettle, put in seasoning quantum suf. and sat down on a camp stool to watch it boil and simmer, adding a stick of wood to the fire from time to time till it got to a consistency that would exactly suit him.

I left him stewing over his stew and went down and fished a while with Bradway, going back in half an hour or so to see how the dinner was coming on. At last Tom announced the stew to be just between a soup and a potpie, which he said was the proper thickness for a stew, and we hollered for Brer Bradway to come up and "jine," but he hollered back that he had just eaten his snack and couldn't come, as he was looking for a bite every minute. Tom said, "Let 'im alone; that feller would rather fish than eat."

We sat down to that famous stew, fried fish, fried potatoes, bread, butter, honey, coffee, "et settery &c.,"

good, some better—but that stew of Tom's seemed to lay over 'em all, and I stand ready to back him against all the camp cooks on the continent as the concoctor of a savory, palatable stew that will reach the spot with the most directness and satisfying results. Brer Smith and Brer Bradway will never find out what they missed by not "j'inin'" us on that perfect October Sunday.

We left the table as it stood, dishes unwashed, and went down the stream to put in the afternoon fishing till it would be time to pack up and break camp. We wanted the big bass that got away to take home with us, and we all three went down to the wide water determined to circumvent him if patient and careful fishing would accomplish it, but after an hour's still-fishing along the willows, and casting with the most enticing minnows, up, down and across the stream, over every square yard of water to be reached by short and long casts without sign of a strike we gave it up; he was too

AMIALE SUBJECTS FOR THE CAMERA.

Photo for the Forest and Stream by N. L. Stebbins.

wary and smart for us or had not yet forgotten the big yaller chub that was loaded, and he's there yet to the best of our knowledge and belief.

When the sun touched the top of the hill across the river we reeled up and went to camp, leaving the old warrior for Bradway to practice his arts on at a future time, and yet I am fain to admit that Tom and I were a trifle sore at having to leave the stream without him. Tom and I are only human, same as some other people.

Bradway said he had a big box tank in his spring

love the woods and the streams, and it creates a bond of fellowship that I trust will not soon be broken.

We think of going back next fall and making a camp on the same spot for a few days, but we will try and pick a time when the water is clear—and our skunk away from home—and then, if some other fish crank has not inveigled him, "the bronzed warrior of Riggles' Bend" will more than likely lose his scalp at the hand of one or the other of the two cranks, Tom Smarr or

KINGFISHER.

Natural History.

Notes of Recent Rambles.

In the Oaks.

YESTERDAY (Feb. 27) was a day typical of early spring—resplendent with sunshine and full of the relish of growing things. A week previous, when it was raw and chilly, I had seen and heard robin, bluebird, song sparrow and meadowlark. What wouldn't such a day as this bring forth? I entertained serious doubts of finding good walking along the country roads, still the temptation for a ramble proved too strong, so I boarded an early west-bound car and rode to the terminus. I was about to strike out for the nearest woods, when I was aware of a bright bit of color in a tree across the road. A second glance was sufficient to tell me that it was a cardinal grosbeak. I am always glad to meet him. He is such a beautiful creature, such a delight to the eye! In many cases it is always the unexpected that happens. If I had been in quest of the cardinal he would have eluded me, as he has done on many occasions. I feasted my eye on him until he flew away in a southern direction, when I presently followed on his "shining trail." But Mudland was before me. I must either turn back or brave a Farmers' Protective Association sign, stuck on a tree at the entrance to Oakland, warning trespassers. I chose the latter, and the oaks soon encompassed me. I would explain to the owner afterward. Surely he would prefer matted leaves to walk upon than just plain black mud. Signs of spring were creeping apace. A large willow standing by a water course hard by almost cast a halo over the surroundings from its golden whips; from a hillside sugar maple the sap was dripping where some one had cut off some twigs; in a hollow the thorny tips of the haws were reddening and grass was greening in patches. A sunny, sheltered slope looked so suggestive of coming wild flowers that I instinctively stirred over the dead leaves, perchance to reveal a swelled bud. I thought of the trailing arbutus. Even its glossy, evergreen leaves would be a welcome sight. But this "darling of the mold" of my native woods finds no home here. Some weeks hence the same sheltered slope will yield an abundance of spring beauties and dog-tooth violets, but just now they must exist only in one's imagination. Under vander oak a bluejay is hopping awkwardly along the ground, savagely pecking at some fallen acorns and screaming vociferously, at times pausing to look at the resisting acorn with a significant look and screaming, "Do it! do it!" What a morning for birds! Strange and familiar sounds come from far and near. The downy woodpecker's drumming, the chickadee's sweet phoebe note, the nasal pipe of the nuthatch, and the peculiar dog whistle of the crested titmouse enliven the stiff-looking oaks. Reaching an open field I note the unrising of a meadowlark, and catch the gleam of his yellow breast. Shore larks are walking or running about, frequently flashing back and forth singing their sprightly songs. All during the winter these birds have been here in goodly numbers, giving soul and life to otherwise bare places. A colony of Canada sparrows and juncos are holding high carnival in a weed-grown swale, and from frequent per-chic-o-pees I know that goldfinches are there also. Leaning on a fence watching them, I hear the song of a song sparrow, and very sweetly it sounded. Presently I see the little minstrel in a low hush hush hard by regard me with a hoarse chirp. Other bird voices are in evidence. Highholes are calling in the oaks, a cawing crow goes by on lumbering wing, and in strange contrast I hear that "violet of sound" the bluebird's warble. In a grove of mixed oaks and walnuts I find a solitary redheaded woodpecker, who has been lingering here throughout the winter. Emerging into the highway on my homeward way, I hear the unmistakable "honking" of wild geese, and high above a V-shaped flock of fifty-three are northward bound. I watched them until they faded away in the distance. There is always something wild and exhilarating in such a sight. It was John Burroughs who said, "I hurry outdoors when I hear the clarion of the wild gander; his comrade in my heart sends back the call."

A Tricky Brown Tree Creeper.

That the tree creeper is shy and unwilling to be observed I know full well, but I never had reason to think that he would indulge in little tricks until on a certain occasion when a companion and I, finding him on a small oak, crowded very close to better observe his spiral climb and minute inspection of the highways and byways of the tree. Seeing that he was watched he flew to a post of a railway trestle near by and disappeared in some manner. We noticed that he did not fly beyond, and so made a careful search for his hiding place. We were about to abandon this when I discovered him in a narrow niche between a post and a crossbeam, closely clinging, within arm's reach, to the side of the beam. He appeared to be asleep, but when I tapped the post he suddenly became alert. He was only "playing possum," it seemed, and not until my companion's hand was about to close on him did he fly away.

A Stupid Screech-Owl.

Walking along the edge of an oak opening a few Sundays ago, my companion and I heard the whinnying of a screech-owl. The sound appeared so close by that we turned in the direction from whence it came. Presently hearing a repetition we located the sound issuing from a thicket of wild gooseberry bushes adjoining a nursery, where a flock of Canada sparrows were reveling. Reaching the scene we sharply scrutinized the thicket and the contiguous fence, but without seeing anything that looked like an owl. We were about to pass on when my companion's sharp eyes discovered something on the lower board of the fence, where it issued from the thicket, that looked more like a ball of brown leaves than anything else. A closer look revealed the owl staring at us with his big eyes. Such a round, fluffy creature! He looked so stupid, demure and helpless that his capture seemed an easy task. Slowly approaching from opposite directions, we kept his owlship busy for a while, turning his head from one to

the other. He evidently was aware that something unusual was transpiring, and it seemed queer that he would not attempt to escape. Almost up to him, I was about to seize him when he slipped from my fingers, and with noiseless flight sailed down to a clump of osage orange saplings, where in the manner of a young bird he missed his hold and fluttered to the ground. Before he recovered my companion had covered the intervening space and had placed his cap over his prisoner. The strangest part of it was that he seemed perfectly reconciled to his capture—did not offer the least resistance. Thinking that perhaps he might have been hurt we made an examination, but nothing was revealed. My companion took him to his home, a short distance down the road, and placed him in a large cage. I waited until dark to see how the owl enjoyed his prison and left him blinking contentedly on his perch. The next day my companion informed me that he had given the owl his liberty shortly after I left, and had the satisfaction of seeing him noiselessly disappear in the darkness. T. M. S.

SPRINGFIELD, Ill., Feb. 28.

About Wild Pigeons.

NEW YORK, March 14.—*Editor Forest and Stream:* I wish you would write an article in your paper and tell me, if you can, what has become of all the wild pigeons. About twelve or fourteen years ago they used to appear in large numbers; sometimes the sky was perfectly black with them. Now they are rarely if ever seen. I am speaking of the South, as I do not know whether they inhabit the North or not. You will much oblige

A READER.

MACOMB, Ill., March 6.—*Editor Forest and Stream:* A few months ago a correspondent of your valuable paper at Chicago wrote an article stating he had found out where the American wild pigeons had gone to; that they were in Central America. As soon as I read this article I wrote to the American Consul-General at Guatemala, asking if the American wild pigeon was found in that part of the country. I inclose his reply.

I have taken great interest in trying to locate this beautiful bird. Every attempt has proved a failure, and I am satisfied that but very few are left on the American Continent. The question arises, what has become of them? My opinion is that some disease broke out among them, which came very near exterminating them. Two years ago a hunter here found three and killed two of them. I understand there were three small flocks seen in the State of New York last year.

W. O. BLAISDELL.

Consulate-General of the United States of America, Guatemala, Feb. 14.—W. O. Blaisdell, Esq.—Dear Sir: For dinner last evening we had your wild pigeon, that is in fact a small dove, quite similar to our mourning dove at home. They are not the wild pigeons you are looking for, and which the Smithsonian Institution says are extinct. There are no pigeons here.

A. M. BEAUPRI, Consul-General.

WADSWORTH, O., March 15.—*Editor Forest and Stream:* Some time ago I noticed a comment as to the wild pigeon, and if there were any left.

Last week (March 8) a flock of fifteen passed over this place, going in a northwest direction. On the 10th a flock of twenty passed here, going in the same direction.

These are the first that have been seen here in many years. There can be no mistake in the birds, for they were seen when flying low, and by old people that are accustomed to their flight.

I would be pleased to hear if pigeons have been seen in other parts of the State and United States.

J. F. DETWEILER, M. D.

[The wild pigeon has gone to the place occupied by the buffalo—out of existence as a species to be commonly seen.]

A few still exist. Last year we saw three or four in Connecticut during the breeding season, and heard on good authority of ten or twelve others. A few are said still to be found in Minnesota, where they breed in pairs, and not as of old, in great communities. The disease that exterminated them was a persistent course of netting and of breaking up roosting and breeding places. They are now rare birds, and are likely to become more so.]

A Wild Goose Story.

THE Rochester Herald prints this story, coming from Mt. Morris, March 14: A very strange and before unheard of incident occurred about a mile west of this village Saturday evening about dusk. Frank Kress, accompanied by his little son, had been to this village after a load of coal, and when near their home on their return they discovered a flock of about twenty-five wild geese. Kress thought he would capture the whole flock with the aid of his boy. They went at it in a very systematic manner, and the birds did not seem to be afraid at all.

They succeeded in driving the whole flock into the barnyard, and Kress was congratulating himself on his valuable capture, when about fifteen of the big birds rose up and flew away. It looked for a moment as if the others would go, but they acted as if dazed, and did not attempt to fly. They drove the rest of the flock, consisting of ten birds, into a shed, where they were captured and taken to the house and locked in the woodshed.

Some time Saturday night three of the geese escaped through a small door, which had carelessly been left unlocked, but seven of the birds are still in captivity. Mr. Kress told his story on the streets in the village Saturday evening, and many old hunters who knew of the habits of wild geese and are aware how difficult it is for a hunter to get very close to a flock of them, found it hard to believe that the birds captured by Mr. Kress were really wild geese. Mr. Kress had many visitors yesterday to examine the birds, and all who saw them were fully convinced that they were the real wild birds, but how they happened to be so tame as to allow Kress to drive them into a shed is a mystery. Kress says the birds are for sale.

Game Bag and Gun.

Paradoxes and Sport.

HAD it been so ordained that our pathway through life would be marked by an unwinding ball of thread, what devious pathway would be revealed on attaining the summit of life, and how different the task of retracing our footsteps!

And could we scan the tortuous unwinding of our mental footsteps, would we not be confronted with many inconsistencies and paradoxes that highest philosophy could not explain or harmonize?

The toddling boy on his way to school pelts the frogs with pebbles, and therein finds superlative joy; his older brother climbs a tree and robs the helpless mother of her callow brood, and finds pleasure in exhibiting his booty to his envious and admiring companions; and the beardless youth about to exchange the pulpy adolescence of immaturity for the less mobile material of mankind finds keenest diversion in setting miles of snares to capture the unsuspecting grouse.

Childhood, boyhood and youth vanish with the fleeting years, and pebbles and snares give place to rod and gun—engines of greater destruction, and more relentless. Waters are vexed and forests overrun, and satiety is still beyond the horizon; the highest peak is no barrier, and the ice fields of the frigid north do not repel; man armed with the implements of death ever continues the work of destruction during all his active years.

The boy who pelted the frogs has now ascended the steps to the heights of opulence, and purchased the fishing rights at a fabulous price in some famous salmon stream, and now with all the ardor of exalted manhood he contemplates with disdain and launches unkind epithets and vehement anathemas upon all who must be content with lesser sport; the older brother has long since exchanged his hundreds—perhaps his thousands—of dollars for a membership in some millionaire ducking club, and now learnedly discourses upon the ethics of sportsmanship and the higher branches thereof, and he has only contemptuous sneers and severest denunciations for those with a smaller bank account, and who perforce must be content with more humble sport, while he and his companions wage merciless warfare upon the sea fowl when on their migration to their breeding grounds in the distant north in the early spring. The beardless youth in after years has forgotten all about his grouse snares of earlier years, and he is now foremost in the endeavor to secure legislation against their use, and glows with enthusiasm when relating his adventure in the distant wilds, where in the still evening of autumn time he sent the cruel leaden messengers of death through the heart of the unsuspecting lordly bull moose, lured into his presence by the seductive music of the birch-bark horn in the hands of his skillful Indian guide!

This latter would resent with righteous indignation and scorn the suggestion that such slaughter savored of butchery, and he doubtless would be heard above the others who sit in judgment and condemnation of jack-in-the-deer, and with emphatic vociferation loudly extol the one while roundly denouncing the other.

How oft, alas! do the words of the poet come unbidden, and with what force and emphasis do they apply:

"When such occasions are,
No plea must serve; 'tis cruelty to spare."

And where is he who will cast the first stone? Where is he who will call a halt? Where is he who will fix metes and bounds? And must all find shelter and protection under the generous ægis of the ethics of sportsmanship?

The boundary line is but too often an indistinct blazed trail, leading through many a devious pathway, and across which many thoughtlessly wander; and a generous chivalry founded upon consistency should prompt a becoming modesty to withhold words of censure and condemnation when they may apply with greater force to him who utters them than to the person for whom intended.

We should not be unmindful of the words of Alexander Pope, written more than two hundred years ago:

"Pleasure, or wrong or rightly understood,
Our greatest evil or our greatest good."

GEO. McALEER.

WORCESTER, MASS.

A Florida Quail.

HAWTHORN, Fla.—I with my little daughter came here in the middle of February from New Hampshire and took our old quarters at the Commercial Hotel (this being our third winter here). We came for the climate and shooting. This is a high, healthy place. The air and sunshine are charming. We can't realize that there is any cold weather anywhere. Mine host, W. S. Moore, keeps fine dogs and trained hunting horses; is the best of guides. He seems to know by intuition where every covey of quail is for miles around. We have had fine shooting and made good bags every day.

We went one day to Moore's duck camp, on a large marsh, for ducks and snipe. From the effects of a recent rain the snipe had changed. We saw a great many empty shells, where they had been shot. Snipe come and go it seems in a night. We saw hundreds of all kinds of ducks. The marsh is bare of cover since the cold in January killed the water flags, and the water is so low that the shooting sink boxes stand up so as to look like bales of cotton, and a duck will not come near. We did not care to wait to have them put in deeper water, so gave up the duck shoot. We had some good winter yellow-leg, plover shooting. There are large flocks there, as the weather looks threatening.

After dinner yesterday we started for home, expecting to shoot quail en route. That is my favorite sport. I took the dogs and went in to hunt a beggar weed field. Mr. Moore drove along on the outside. The dogs soon came to a point near the woods, but as my dog (Sport) was too near a large covey flushed before I could signal Mr. M. I got one with my right and two with my left in the rise. Mr. M. marked down. He got a beautiful

right and left double in and a 50yds. kill. Then we got each a signal bird. Many of the birds went into the trees, as they do here the first time they are shot at very often. Not over one-quarter of a mile beyond Moore's Don took the wind and soon came to a handsome point in a field. We got three birds in the rise. Marked down near a thicket. They flushed wild, but we got in a double. This gave us fifteen quail in just thirty minutes.

After a drive of one and one-half miles the dogs made game and went over a fence into the wind 200yds. My dog Sport pointed in a thicket. We flushed two coveys in the bush, with no shots; but some of the birds flew through, and we got one each. In this field we both got rattled; made many misses, and got only ten and lost two. Snipe Point was our next stop. There the dogs did some fine winding, and made a splendid point. I got two in the rise; Mr. M. got a shot at his bird. As I went to get one of my birds I walked up a very large bevy and got one. Mr. M. marked. The dogs each had a bird. I got a right and left; Mr. M. two single birds and shot another which flew a long way. The ground being too bare the birds flushed again and went to an

pulpit is the ideal man and preacher, and he indulges in all these things; is always armed and always accompanied by a dog, that should he have been able to have selected his own pedigree he couldn't have done better.

When a man, be he either of the clergy or a layman, discovers a covey of well-groomed quail, he has discovered a bunch of flying facts; when with the assistance or directions, maybe, of his well-trained, precious dog, he gathers in these scattered facts he has got something real.

Some men miss most of these coveted and hidden facts, while others gather many. The feast is always in proportion.

Adaptability with the Bible and gun are alike in at least one sense. Some can gather bags of real facts, and reason, and good with both, while the sweet essence of either or both are lost to many.

The students of all classes, whether in the pursuit of theological or agricultural facts, can better deal with the intricacies of their calling or chosen paths in life who seek inspiration away from the tools of their labor, be they page 19 of an old Greek Testament or the newest

Sharps with a view of slipping down the road to the east, screened from view by the bushes growing along the hillside, and secreting herself in front of the slowly advancing game. And now an unexpected trouble was encountered—the gun hammer wouldn't stand cocked! How had papa managed to hunt with it all these years if the wretched thing acted like this?

Finally, after a deal of nervous experimenting, it was discovered that the set triggers had to be first adjusted when the gun worked perfectly. Taking three express ball cartridges she then hurried down the ravine, and succeeded in gaining a position in front of the wary animals, and catching a glimpse of them through the bushes she cocked the rifle, when again the elusive creatures vanished in the bushes.

Seeing a better position in front she advanced carefully, but without thinking to lower the hammer, when a touch from her unaccustomed finger sprung the hair trigger; the rifle roared unexpectedly, and the express bullet tore up the earth in front, while the deer bounded off up the hillside and vanished completely.

Meanwhile Mrs. Belknap had been keeping watch from

A BOSTON "MOOSE YARD."

Photo for the Forest and Stream by N. L. Stébbs.

open grass field, where it would have been murder to have followed them. We had killed thirty-three quail in three and one-half hours, and had a number of plover and snipe, and being six miles from home did not follow.

This is a wonderful quail section—I never saw the equal. We hunt in buggies and drive through the open woods anywhere. It is truly sport. Not the hard tramping one has to do in most places.

The season for quail closes March 15; for doves, snipe and duck there is no law. A. H. C.

The Pulpit and the Field.

THIS subject may, to many of those of the blue-stock-ing, straight-laced persuasion, savor more of the carnal than the spiritual. To the broad-gauged mind that has never been wrecked, side-tracked or stuck in the mire of prejudice and narrow-gauged early training, or swamped by dogmatic teachings of the present, it appeals with winning freedom to the former, and a sweet sense of appreciation of the latter.

It is the logical mind that reaches logical conclusions. This is very true in the pulpit. It's equally true of and in the field.

I don't contend that a preacher must shoot well or should shoot at all to preach well, but I do believe many of them would preach better if they shot even indifferently. It's where the gun takes us that we get inspiration, to say nothing of the charming companionship of our dogs.

The confines of the book-bedecked library or study are full of facts, fancies and dogmas. The average congregation knows this exceedingly well. Still it's in these confines that the great truths have been sifted out and given to us, and too for our good and edification. Great minds have been wrecked in research and study, others are on the verge of toppling, while still others ought to be employed in planning the easiest and most expeditious way of plowing a thirty acre lot of stumpy ground in a given length of time with one of their pair of oxen laid up with the colic and the outcome of the disease uncertain.

I say this notwithstanding the fact that probably of the men I love most the one is of "the cloth," nor is it my intention to cast any undeserved reflection on our able clergy.

As the sunlight is good for the flowers (if not essential), so too the broad fields, the tangled weeds and brush, the worn fences and blackberry briars, the wash-outs, scrub oaks and pines, while not essential, are surely good for the "gray matter" in man. My occupant of the

invention of a plow on which the plowman can ride.

A man who can eulogize the life and death of a great dog and finds in his memory's precious cells indelibly engraved pictures of the points and flushes of his dog's earthly career, and at the same time fills a prominent position as a Bible historian of our age, or any other good position in life, shows a brain broad and big enough to contain the simple things of life, which after all are the best and purest. Such minds show a finished field training.

An eminent physician recently said to me, "Give me the cold water out-of-door man, of a moral disposition, who of necessity is and keeps himself in good, vigorous physical condition, and the brain and mind will assert themselves."

Sunday morning in the pretty stone church we hear the strong, manly sermons, full of gentleness and purity. Monday at noon the clergy and layman dine by the edge of the brook, seated on broken rocks, from the capacious pockets of the canvas coats. I have heard of the "Sporting Parson" and I like him not. My companion is a clergyman and only a man.

One might as well expect to raise corn 14ft. high in the sands by the sea, or thrifty sweet roses in the sub-cellar of a New York tenement house, as to find great and gentle qualities in the man whose handshake and smile cause us to shiver, be he clergyman or cowboy.

THOMAS ELMER.

ELIZABETH, March 15.]

Her First Deer.

THE old days had gone forever. Conditions had changed entirely. The wild animals had retreated before the advancing wave of civilization, and the time came at length when nothing save the firm good sense of a certain little wife and mother stood in the way of another hegira deeper and further into the heart of the yet remaining wilderness.

Venison had long since disappeared from the cabin and the memory of it had been reluctantly pigeon-holed with that of the buffalo meat of twenty odd years ago.

When at length on a certain eventful morning my wife happened to look out of the window toward the top of the hill a quarter of a mile north of the house, what was her surprise to note three beautiful deer walking slowly along the hillside near the top.

What was to be done? Father and sons were absent, and no one was at home save her and our youngest daughter, Miss Echo Belknap. Two rifles were available, the old .45cal. Sharps and a .50cal. needle gun belonging to one of the boys.

A hurried council resulted in the girl selecting the

kitchen window, needle gun in hand, and a few moments after the crack of the Sharps was heard she saw a deer coming from the direction of the report, and running along the hillside along its back track, stop for a final glance at the cabin about 125yds. distant.

Resting the rifle on the sill of the open window she fired at the pretty creature, and scored a clean miss, when it ran up over the hill and disappeared.

The roar of the needle gun gave the girl the direction the deer had taken, and she hurried back to the house, there to learn of the mother's ill success; and to condole with her over the misfortunes that had overtaken them both.

There was yet a possibility in her favor. Might she not yet pursue and overtake them?

With renewed hope she climbed the hill in the direction from which the deer had first come, and for an hour wandered through the forest in a vain search for the tantalizing creatures, when discouragement again overwhelmed her and she turned homeward, completely dejected.

However, the unexpected had not yet been reckoned upon—that strange factor in the problem of hunting wild animals.

She had reached the top of the hill back of the house when, coming out into a little opening in the bushes, about 100yds. wide, a deer was seen in the opening near the bushes of the opposite side.

Noting instantly that the deer had not yet observed her, she sank upon one knee behind a branch of tiny bushes and fired so hurriedly that she missed completely. Instantly the frightened animal turned and ran directly toward her; while with fingers trembling with excitement she hurried to insert her last remaining cartridge into the barrel of the faithful old rifle, that only needed to be properly handled to account for any game in the hills.

The deer actually ran within 50ft. of her, when, probably hearing the click of the closing lever, it stopped and glanced nervously around in search of the hidden peril, when with a final roar the old reliable stretched the beautiful animal lifeless in front of the eager girl.

Hurrying back to her mother, she told her exciting story. "Were you not sorry for the poor creature after you had killed it?" asked the mother.

"No," she replied, "I was too excited and too jubilant to think of it then;" adding after a pause, "I guess the bad blood must be coming to the front; I'm a Belknap, that's sure!"

And now when the old uncle is delegated to knock at the door of FOREST AND STREAM, and ask of the sportsmen of America in her name for a place among the regularly listed devotees of Diana, who shall say her nay?

ORIN BELKNAP.

CHICAGO AND THE WEST.

Death of Mr. White.

CHICAGO, Ill., March 19.—Mr. W. F. White, general traffic manager of the Santa Fe Railroad system, died at his home in this city Tuesday night of this week, March 15. Thus passed away, perhaps, the most widely known and most popular railroad man in the West, one of the most kind-hearted gentlemen, and one of the keenest, though most unostentatious, of sportsmen. He was known by thousands of men in this city and every Western State, and his death comes as a blow not easily forgotten by any one who knew him. His was one of those sunny, unsoured dispositions which the world can so ill afford to lose.

Mr. White grew up with the Santa Fe Road. He went out into Kansas before the road had crossed the buffalo range, and long before the buffalo had gone. Up to 1878 he was general ticket agent of the Santa Fe road; then he became general passenger and ticket agent. In 1887 he was made general traffic manager. Then he became passenger traffic manager in 1889, and for a time also assumed charge of the traffic of the Gulf and Colorado division. Few men could be busier than he, yet he often found time to talk of the hunting and fishing trips he wanted to make, and sometimes found time to make one, his favorite recreation ground being New Mexico. I first became acquainted with Mr. White in 1886, and am proud to have been one of the legion of his friends. No one who knew him could fail to appreciate his rare character.

The Flight of the Fowl.

The north-bound flight of ducks came in a great rush, but dwindled rapidly. It is now heaviest along the larger waterways where there is more room for the birds to feed or to pass on. The best of the shooting this week has been along the Mississippi River near Burlington, Ia. Along the Illinois River there has been a good flight also, especially in the neighborhood of Beardstown, as earlier reported. Numbers of parties, however, some of them with camping outfits, who have been along the lower Illinois River for some days, report bad luck. A gentleman who went down Illinois River from Macomb says that the truth is the number of hunters simply drove away the ducks, which had no opportunity to feed. Along the Kankakee River the same has been true in miniature. At first there were some startling bags, but now I hear of nothing very great. Dick Turtle and several others were down at Water Valley this week, but only got a very few birds. At Maksawba Club a few guns have been out along the river this week, but with poor success. At Lake Senawine thousands of birds came in about a week ago, and the shooting was better than it has been for three years. All the ice is out from the marshes in that neighborhood. The Desplaines River and all streams below it have been on freshet, and with the disappearance of the ice and opening of the streams the birds have scattered somewhat and passed on up. Further to the west on the Platte River the goose shooting is now well over, and the duck flight is on. During the coming week Wisconsin, Minnesota and Dakota will take their turn at the flight. Ducks are reported now on Lake Winnebago, Wis.

It is thought that the season will be an early one in this part of the world. Already a few jacksnipe have been killed just south of Chicago. They are reported to be as lean as snakes.

We rarely have any geese in Illinois nowadays, and the sandhill crane, which once migrated in thousands across this State, is now rarely heard. In the old times the spring flight of ducks would stop for weeks in Illinois, and a great many birds breed in this State. Now their spring stops are very short.

The Illinois Warden's Work.

State Warden H. W. Loveday, of Illinois, certainly deserves credit for the way he has been chasing up the "sooner," the "later" and the illegal shipper. He tells me this week that he has secured 540 convictions, according to the last count. There is hardly a county in the whole State which has not furnished its share in this grist. The hardest offenders to get at are those in the lower counties, where the game is shipped to St. Louis market and not to Chicago. The system in Chicago is such that a box of illegal game coming in is apt to be spotted. The name of the shipper is then learned, and in due time the warden goes down into his county, and at his leisure pulls the man up and has him duly fined. Within the past week Mr. Loveday and his assistant warden, N. H. Edenborough, have tried seventeen cases and secured sixteen convictions, the fines running from \$25 to \$110. The highest fine was secured against Geo. N. Corbin, a coal dealer, of Carthage, Ill., who has been buying up local game and shipping it to Chicago. At Tuscola, Fred Beedle was fined \$47.50. He got off easy, for he had killed thirty-two quail and shipped them to Chicago, where evidence was secured against him. A very interesting case was that of P. F. Darrah, who was tried at Macomb. A great deal of interest was taken, and a crowd was at the trial. They witnessed Mr. Darrah get properly soaked for shipping 114 quail to Chicago. He was let off easy. Warden Loveday has been invited to visit the officers of the Winnebago County Fish and Game Club, the new organization of which mention has been made in these columns. This league of sportsmen now has eighty members, and expects to have 200, and each of these members will endeavor to stop the violations of the law along the Rock River.

This week Warden Loveday seized a box of freshly killed prairie chickens, shipped from Iowa. They were, of course, full-grown spring birds, and would, if alive, this week be booming and dancing on the breeding grounds. It seems so wrong to kill prairie chickens this way in the spring—though I suppose it is really just as wrong to kill ducks at that season.

Warden Loveday says that he has endeavored to establish reciprocal relations with the wardens of all Western States, so that he may act as their agent in this city. Minnesota and Michigan have already appointed him as such agent, but he has received no word whatever from

Iowa, Missouri, Nebraska, North and South Dakota and Oklahoma Territory.

Mr. Loveday says he does not think there is any very great amount of illegal game being held in cold storage in Illinois after the close of the selling season. The great bulk of the Chicago contraband game was sent to cold storage in Troy and Utica, N. Y. Of course the ownership was never changed, and the demands of this local market were never overlooked. The users of small lots of illegal game, such as the clubs, hotels and restaurants, are thought to be supplied to some extent by package shipments from this Eastern cold storage. This is the latest way adopted by our gentle citizens of South Water street, who stand for the inalienable rights of every man to grab off everything he can until he gets caught.

In spite of all the above, however, it is known to a good many interested parties, and admitted by Mr. Loveday, that there is some illegal game still in the hands of Chicago dealers. Our good friend "Possum Bill" Werner, steward of Kinsley's restaurant, stated publicly that he knew of certain lots of game which had been sold illegally within the past few days, some of which game had been offered to him. He stated that a certain firm had to his knowledge sold illicit game to Rector's restaurant. This he cited as proof of negligence on the part of the warden. Mr. Loveday this week got a subpoena for Mr. Werner, and he will be used as principal witness in the trial of Mr. Rector, which is set for this afternoon. It is thought that Mr. Werner can introduce sufficient evidence to convict Mr. Rector, although of course he would hardly give this evidence with anything but reluctance. There is no doubt that Mr. Werner can get track of a great deal of evidence bearing on illegal handling of game in this market. He is a good sportsman and would like to see the game laws observed, but has been disgusted at seeing them broken so openly and often. I hope that his little feud with Mr. Loveday will be healed up, and that he will give the warden all the assistance in his power. The two ought to make a pretty strong team among the restaurant trade. I do not believe that any right thinking business man could blame Mr. Werner for publicly joining in such a work. His heart and sympathies are wholly those of a sportsman, and no man, sportsman or otherwise, ought to be penalized in his business for a position which simply holds out for that respect which any citizen should give the laws of the land. The Rector case will probably be continued to-day, but there will be fun when it really comes to trial. Justice Prindiville will be the judge.

The amount of confiscated game in this market makes quite a big figure in the warden's yearly income. At one time last summer Warden Loveday had a lot of 1,400 illegal prairie chickens, all of which were shipped in warm weather, and all of which arrived unfit for even illegal use. They were dumped into the sewers in one lot. In such a case as this there is no confiscation money for the warden, but sometimes he has better luck. He got together at odd times over 3,000 illegal prairie chickens, which have been or will be sold at auction. A public auction of contraband game was held by Warden Loveday yesterday, March 18. I met Warden Loveday just after the close of the sale, and he told me that he had just sold forty-six dozen grouse at the handsome figure of \$7.50 per dozen. This shows what the demand for this game is at this season of the year. The quail sold yesterday did not bring such good prices, running about \$1.85 a dozen. The total results of this sale foot up nearly \$600. I asked Warden Loveday what would become of this game, and what would hinder other game being hawked around among the Chicago clubs and restaurants under the pretense that it was this auction game. He said that legally this auction game could be thus sold, or had in possession, but that he had forestalled this contingency by making it a condition that the purchaser of this game should at once ship it out of this market. This, of course, is putting the best face possible upon the rather awkward situation created by our Illinois statutes, to which I have earlier called attention. On the above showing, however, one is bound in justice to say that Mr. Loveday has been doing fine work in his office as State warden, and his administration is a relief after those of some of his predecessors.

In the Galaxy.

I wish to add to my galaxy of distinguished citizens, not above breaking the law, the name of Mr. R. J. Bell, County Attorney of Roseau county, Minn. Mr. Bell bought illegal moose meat, it is alleged, and also, as alleged, advised local butchers to handle such meat. It was his shrewd practice to have this meat passed through the custom house on the ground that it came from Canada. Warden Fullerton had Mr. Bell bound over to the grand jury. The Governor of the State will probably call for the key of Mr. Bell's County Attorney office.

Mr. Fullerton did another good piece of work last week when he rounded up William Kingston at Duluth. Mr. Kingston was caught with \$8,000 worth of illegal partridges in his possession. "Give me \$1,000 cash, Bill," said Mr. Fullerton, "and I'll let you go this time." "All right, Sam," said Mr. Kingston, "I take pleasure in giving you \$1,000 under the circumstances." This he did, and the indictment brought by the grand jury will now be quashed.

Acclimatization.

In these days one hears very much about experiments in planting game in different parts of the country. Mr. D. C. Buckstaff, of Oshkosh, Wis., has ordered eight dozen quail from Kansas, which will be put down near Vinland and Rushford, in Wisconsin.

Another batch of 120 Kansas quail was received last week by the Gun Club of Missoula, Mont., and will be put down in the Bitter Root Valley. The quail which were put down by Stevensville sportsmen in the Burnt Fork country have been doing very well, so that the experiment is considered sure of success.

I have already spoken of the importation of mongolian pheasants by Mr. Losekamp, of Billings, Mont. I learn that Mr. Losekamp will try to cross these birds with the native blue grouse. He wishes the aid of a

few good ranchmen who will see that the new birds will be sure of protection after they are turned loose.

The last case of importation of game of which I have word this week is the shipping from Idaho to Butte, Mont., of 200 live jack rabbits. These, however, are not to be liberated, but will be used for coursing by the Butte Coursing Club.

The Loophole Again.

They don't shoot ducks in the spring in Ontario, for they have the Canadian respect for good, sensible game laws, well enforced. Yet a curious measure is to come up this spring, probably inspired by persons living on the American side, this being a movement to legalize the shooting of merganser ducks on the Canada side. The mergansers are fish ducks, and not good to eat, and it is urged that there could be no harm in shooting them. That is the theory of it. The practice of it would be that the gunner who went out after mergansers would very often be tempted to kill good ducks, and very often some gunners would do so. The loophole is the best possible argument against special laws and in favor of broad and uniform ones.

Without Thanks.

In the course of my career I have very often had my stuff declined by a great many editors, some of them very good ones and of good judgment, but I never minded that, because they nearly always decline the stuff with thanks. Now this sort of thing doesn't seem to work the other way. The editor of the San Francisco Report uses my Chicago and the West stuff right along, but he doesn't do so with thanks. He just swipes her and lets her go. I reckon that is easier for him, but it seems odd to find Montana and Utah news printed in New York and used in San Francisco as original news. This is what we used to call the grapevine telegraph when I was moulding opinion further West.

The Sun River Elk Case.

The following paragraph covers the latest news regarding the Sun River elk killing in Montana, to which attention has been called earlier: "Tuesday was a busy day for Justice of the Peace Mayer, at Augusta. State Senator W. F. Flowerree, Dr. Winslow, Emil Sturzenegger, William Lange, Ernest Elder and Frank Hirsch were arraigned that day for violation of the game law. Flowerree, Lange and Elder were discharged, there being no evidence against them. Dr. Winslow, Frank Hirsch and Emil Sturzenegger pleaded guilty to technical violation of the law, and each was fined \$100 and costs."

Indiana Ducks.

Mr. A. F. Osborn, writing from Kaukaee, Ind., has the following information about the duck flight this spring in Indiana, and the prospect of fishing at an early date:

"Quite a number of the Kankakee boys have been shooting lately in the Kankakee swamp lands around Shelby and Lineville, Ind., with some fairly good bags, thirty-five to forty ducks in two or three days' shooting. Ducks were rather wild (a good thing), and did not stay long. Shooting only lasted a few days. If spring shooting could be stopped, we might see game again like 'it used to be.'"

"Fish are beginning to bite a little; some good 'salmon,' as they call 'em here, have been caught (4 and 5 lbs.), and a few bass. I hear that around Waldron, between there and Muncie, a number of good-sized pickarel have been taken—7-pounders. The weight generally grows the further it travels."

"The most sport I have had lately has been in reading FOREST AND STREAM."

Minnesota Spring Law.

A quiet movement is already going on in Minnesota looking toward the abolishment of spring shooting in that State at the next session of the Legislature.

Back from the Blackfeet.

Mr. Calvin S. McChesney and Mr. George B. Harrison, of Troy, N. Y., whom I have mentioned earlier as absent in the Blackfoot Reservation country after sheep and goats, guests of the Indian agent and of Mr. Schultz, of the reservation, are in town to-day on their way back home. They both look brown and hearty, and report a splendid time. They report our friends, J. W. Schultz, Joe Kipp and Jack Monroe, of the Blackfoot Reservation, all well and prosperous. Billy Jackson they did not get to see, but I am sorry to say they heard that Billy was not in very good health. As to the success which they had this year, I am not going to spoil a good story by saying anything about that yet. Mr. McChesney has promised to write out the story of the hunt, and I can promise that it will be something good.

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

To-day and Yesterday.

BUT few people realize nowadays how rapidly civilization and its settlements have encroached upon the wild lands of this country and driven or exterminated from their haunts the animals native to the forests and prairies that formerly existed.

Where now is heard the busy hum of civilization, where cities, towns and villages are almost within sight of each other, where every foot of land is now made use of by man and where it is impossible to get out of hearing of the locomotive, steam whistle of factories, or church bells, within the memory of men now living, there existed the forest primeval, or far-reaching stretches of prairie teeming with wild creatures as free and undisturbed as they were a thousand years ago! What a transformation!

When some old gray-haired friend reminds us by reminiscences of the past, as my friend Mr. R. Long has just been doing, then we awake to a realization of the rapidity of the Western march of civilization. Mr. Long came to Iowa in 1842, and located at the then little hamlet of Eddyville, on the Des Moines River, in the southeast part of Iowa. Deer were yet quite plentiful and a band of elk still inhabited the timber

on the river near Eddyville. Iowa, now a prosperous agricultural State, dotted over with busy communities, and practically speaking having no wild land left, was then to the eye a boundless stretch of wild prairie, with here and there a narrow strip of timber along some stream.

I have often heard my father speak of the countless thousands of prairie chickens which were here when he first came, in 1855. I have heard father speak of seeing flocks of prairie chickens so numerous as entirely to cover acres and acres of ground. Now there are but few left.

The story which impressed me most was told me by Mr. Long. It was about the first event of which he has any recollection. In the year 1821, then a child three years old, he lived with his parents in a little village of log houses, where the City of Columbus, O., now stands. One autumn day the father took his rifle and went into the woods on a quest for game. The day passed and darkness came, but he had not yet returned. Alarmed at the prolonged absence of her husband, the mother wept, fearing that some harm had come to him. At last the welcome sound of footsteps was heard approaching, and Mrs. Long opened the cabin door to welcome the returning husband. As the hunter entered the door the little child gazed with wonder at his father and the burden he bore, and although the event occurred seventy-seven years ago, the scene so impressed itself upon the mind of the little child that it still remains indelibly stamped on memory's faded page. On his father's shoulder rested the rifle, and from its barrel several wild turkeys were suspended by their necks, while the strong right hand of the hunter grasped by the scruff of the neck a dead panther, which he dragged into the cabin. This even occurred within the memory of living man where Ohio's busy capital now stands. Mr. Long, though eighty years old, is, like his father before him, a great lover of the rifle, and is still in spite of his fourscore years an excellent marksman. JOHN C. BRIGGS.

NEVADA, Ia.

The Youthful Spirit Survives.

YOUR editorial in issue of March 12, "Weapons Old and New," suggests: I was a mere stripling in 1835, but had the afflatus of hunting and fishing at the early age of seven years. Born on the banks of the Susquehanna River, where the fishes from the Chesapeake Bay came up to spawn, I was, at the age of seven years, an expert in handling a canoe, and to get the best results from a day's fishing. I was even then a sportsman having no need to fish excepting for the excitement attendant. Striped bass (rockfish), white perch and yellow perch, which took the live bait (minnows), were the only game for which I would fish. There was not any anxiety expressed on the part of my mother when I did not show up at supper time. She would say: "Well, he is having bad luck, and is awaiting a change." Never would my mother admit I could do other than right, according to my lights, and as my young judgment dictated.

So also in the matter of hunting. My father had an old smooth-bore rifle, a relic of the Connecticut contingent of 1776, stocked to the muzzle, flint lock, and of such length that I was compelled to put it at an angle of 45 degrees or more in putting the charge of powder and shot into it. I had often to pick the flint and scrape the "leaf" in order to get a spark from the flint to make a flash in the pan. Sometimes it would "go off," and sometimes it would be only a "flash in the pan." You will remember this was in the year 1835. I was of such age I could not hold the long gun at arm's length, and would take a "rest" against a tree or such other help as at the time presented, in order to have a sure aim and successful shot. I did fairly well, and was the envied of all the boys who did not possess firearms.

My first pheasant (ruffed grouse) was the first grand accomplishment, and while it was killed sitting I was not the less elated, for at that early day there was little known of shooting "on the wing." I was the envy of all the boys, and escaped a whipping at home simply because I acknowledged I did not kill the bird "on the wing." Now, with our improved arms, and after a period of sixty-three years, I am as eager to join in the sports of the field and stream as when the young blood went coursing through my veins, and so long as life lasts and my pulses keep time to the rhythm of forest and stream I will not surrender—not surely until the Great Creator says to me: "Come thou to fields other than of this earth."

Your good journal gives me great pleasure for the time I am bound to business. E. S. YOUNG.

Pennsylvania State Sportsman's Association.

LIGONIER, March 19.—*Editor Forest and Stream:* The attention of every sportsman in Pennsylvania is called to the annual meeting of the State Association Tuesday evening, March 29, at Reading. It is hoped that all such will attend, if possible, whether members of the Association or not. To show that the Association has accomplished something, I will call attention (1) to the Game Commission; (2) to the present almost uniform game law, which limits the bag, prohibits the sale and shipment of game killed in the State; and (3) to the passage of the game warden bill, which the Governor unfortunately vetoed. All this in practically three years. The united, systematic efforts of all the sportsmen in the State could accomplish almost anything in the way of game protection. J. O'H. DENNY.

Fitchburg Rifle and Gun Club.

FITCHBURG, Mass., March 15.—The annual meeting of the Fitchburg Rifle and Gun Club was held March 14 and officers were elected for the following year as follows: President, H. A. Estabrook; Vice-President, E. N. Choate; Secretary-Treasurer, I. O. Converse; Directors: G. W. Field, Dr. J. W. Stimson, P. G. Stewart, E. R. Wilbur, Jr., C. L. Tenny, M. A. Cutler.

Forty new members were voted into the club, which now has a total membership of 124, the names of Fitchburg's most influential citizens being on the list. This club has one of the finest trap and rifle ranges in the

State, and while its members are not known at tournaments, there are many good shots in the club.

First and foremost this club stands for game propagation and game protection, and its untiring efforts are always devoted to distribute and protect the birds and fish within its jurisdiction. One of this club's greatest successes has been in the line of pheasant raising—and in this respect stands alone and foremost in the State. Their aviaries contain sixteen pens of the beautiful mongolian pheasant, and while a large number of these birds were liberated in the neighboring covers last fall, the manager hopes this year to raise and liberate upward of 1,000 birds during this coming summer. The process of hatching and raising the birds has now become an assured success by this club, and if future generations can count the pheasant as one of Massachusetts' game birds they will owe their pleasure to the untiring efforts of the men in the club who have this matter in charge. The club extends an invitation to all visiting sportsmen to enjoy their grounds, and would be pleased to show their aviaries. NOX ALL.

Sea and River Fishing.

ANGLING NOTES.

Caddis Worms.

A FRIEND who has a trout lake in the Adirondacks told me that his keeper had noticed when a hole was cut in the ice that a bug or worm came to the opening in great quantities, and he desired to know what it was, as he had planted fresh-water shrimp in the pond, and he hoped the bug or worm of his keeper would prove to be shrimps. I asked him to send me specimens, and soon afterward I met him in Albany one evening, and he handed me a bottle, tightly corked, containing what I recognized at a glance as the larvæ of the caddis fly, with movable case, for some caddis flies have movable cases and some fixed cases—the latter often observed on

Caddis Fly.

Caddis Worm and Cases.

rocks in the water, if one takes the trouble to look for them. The bottle was passed around for the contents to be examined by several gentlemen in the club where we had met, and I then put it in my bag and the same night went to New York.

The bottle was given to me in the evening, and I did not make a close examination of all that it contained, but I was quite sure that there were several specimens in the bottle. It was several days before I again looked at the contents of the bottle, which had been all the time in my bag. When I did I was surprised to find but a single larva with an enormous case. The bottle had not been out of my bag, and the cork had not been removed after it came into my possession. My surprise was so great that I wrote to my friend asking if he knew positively how many caddis worms he had placed in the bottle. He said three or four, certainly three, and he thought there were four. This agreed with my recollection of what I saw at a hasty glance, and if true one caddis worm had eaten two or three others and had thus added the materials of their cases to its own—this in spite of the fact that the caddis worm is generally supposed to be a vegetable feeder. There were bits of case material in the bottom of the bottle, but no sign of more than one larvæ.

I took the worm from the bottle and pulled its case into bits and put worm and the materials of which the case was made back in the bottle, and in two hours' time by the watch it had constructed a new case for itself, which practically covered its body; but the case was thin in places, and not as long as before. At the end of two hours darkness came on, and my eyes were tired with watching the construction of the case (with naked eye and with a magnifying glass), and I put the bottle away until the next day. Early in the morning the thin places in the case had been built upon and strengthened and the case lengthened, and I again sat down to observe the building of the case, for the worm was at work actively.

The materials of which the case was made consisted of bits of decaying bark and twigs, and green grasses, etc., all approximately of the same length. Some of the materials floated on the surface of the water and some settled at the bottom. The worm seized a bit of bark or other material in its mouth, assisting the operation with its feet, of which it has six on the anterior portion of its body, and apparently covered it with a secretion from one end to the other, and thus placed it in the case, where it remained. The secretion is really silk, and with this silk the material of the case is held firmly together. If the bit of twig, bark or grass was smooth and straight it was quickly fitted in place, but if irregular in shape it required a long time to fit the material to the satisfaction of the builder. One piece of bark was in shape like a letter Y, and to fit that particular addition took longer than half a dozen of straight pieces. It was tried in one place and then in another at the end of the sheath, tube or case; it was turned over

and over and turned end for end until my eyes ached from watching the operation; but finally it was fitted and made fast. The Y-shaped piece of bark was for a brief moment of time taken by the worm in its mouth and manipulated with its feet as in the first instance, when it was coated with silk, but whether for the purpose of spinning more silk to add to it I could not determine. One piece of green grass was taken by the worm apparently covered with spun silk, and then rejected without an attempt being made to add it to the tube. This was just before dark, and the next morning this same piece of grass was fixed to the sheath.

In adding material to the case the worm would at times extend itself more than half its length from the tube, and it seemed to be able to turn completely around on a longitudinal axis as it worked around the edges of the sheath, adding or fitting materials. This seemed the more strange as at the posterior end of the worm are two hooks which hold it firmly in the sheath or tube, and it would appear that they must prevent the worm from turning completely around. All during the operation of silk spinning and fastening the bits of material on the tube and extending its length the posterior part of the case where the material was thin was worked in convolutions, or perhaps oscillations is the better word, as though the worm's silk factory was in full blast. When the heavy materials at the bottom of the water were added to the case the worm rose to the surface and added most of the floating materials, and then settled to the bottom, and for hours remained inactive except that occasionally it protruded its head. While at work and when more than half out of its sheath I noticed that the worm appeared to have light-colored filaments around the body back of the head and legs, and I assumed these to be a part of the silky lining of the tube; but in this respect I must have been in error.

I cut the case open and examined the interior, finding it smooth and even as possible, the parts cemented with silk; but the light-colored filaments on the worm had, after death, lost their distinguishing color, and my glass was not strong enough for me to detect what they were, except that they were part of the worm and not part of the case lining. So I assumed that they must have been what scientists would have described as "external organs of respiration or membranous filaments covering the abdominal segments." So we will let them go at that. I hope to get more caddis worms for observation (for I made all the use I could of my one poor specimen), and find out for sure if they do prey upon one another, although the corked bottle would have seemed to settle the matter, and it would if I were absolutely sure how many worms were put into the bottle.

Now as to the value of the caddis worm for fish food. In all stages of its development it is one of the very best fish foods. The illustrations herewith show various forms of caddis cases, composed of various materials—bark, sand, shells, sticks, straws, roots, seeds, etc., the caddis worm and a caddis fly. I say a caddis fly, for there are a number of species of caddis flies. In the illustration the fly is shown with wings extended, but at rest the wings fold lengthwise with the body.

Prof. Barluth, of the University of Bonn, examined the contents of the stomach of six trout, and found in the first four caddis cases; in the second 136 cases; in the third 585 cases; in the fourth 116 cases; in the fifth 186 cases; and in the sixth 115 cases. This will show what an important item of food the caddis fly is in its larval stage, and every fisherman who has seen the fly bursting its pupa case at the surface of the water, and rising in clouds, will understand how it furnishes vast quantities of food in its fly stages. The larva can easily be transplanted to waters where it is not found, and as it is as rich in quality as it is abundant in quantity it will pay for transplanting to less favored waters. While it may be true that the larva furnishes a greater amount of fish food than the perfect fly, from the very nature of its accessibility in the water, it should not be forgotten that in the fly stage the caddis fly, May fly, etc., bring trout up from the depths to feed at the surface, and thus are educated to become fly-taking fishes, to the joy of the fly-fishermen.

May Flies.

A gentleman in Quebec writes me as follows: "I am the owner of two lakes sixteen miles north of our city, in which I have hatched many thousands of trout ova. One of the lakes I stocked with rainbow trout and the other with spawn of large trout from some of our south shore lakes. I noticed in the summer of 1895 that the May fly was not as plentiful as in 1894, and 1896 produced still less. Last summer was so bad that only a few flies were noticed in August. Now that my trout are well matured I fear that something must be done to give them surface food this year, and that I must help them all I can during the coming summer, as they are under the ice for six months in this country. Will you aid me by giving addresses where I can procure May fly spawn?"

It is very refreshing to receive a letter in regard to furnishing food for fish, and I would go a long way to aid a man who desires to feed his trout, for too many correspondents ask only for fish, with no word about feeding them, as though trout never ate anything but artificial flies and worm-baited hooks—at the end of a fishing line. It is not possible for me to advise where and how to procure the eggs of the May fly, unless the collector has had experience, but the larvæ may be obtained, and without question the flies themselves can be obtained, and there is no better place to obtain them than on the St. Lawrence River, where there is a rise of May flies lasting more than a month. Probably the greater proportion of the larvæ burst their skins at the surface of the water, and the fly takes wing, so the larvæ cannot be collected; but many crawl up the shore piling, boat houses, wharves, etc., and one watching for them could secure a good number for transplanting; but collected at that stage the fly would soon emerge, and it would be more satisfactory to collect a quantity of the flies, transplant and release them, and allow them to mate and breed on the ponds. Eggs deposited this year would not produce flies under two years, but by this process the ponds would become well stocked. I presume if

Joseph Northrup, State Fish and Game Protector, Alexandria Bay, N. Y., were communicated with he would arrange with some one to collect a quantity of the flies during the flight, and ship them to any point within twenty-four hours of Alexandria Bay. To ship the flies cardboard boxes must be provided and perches arranged for the flies inside. This may be done by sewing through and through the box with a sail needle and Berlin wool, so that the strands of wool will be about 2 in. apart in every direction. Thousands of flies can be collected in a single evening by two or three energetic boys. I told in these notes last year how the flies rise by millions every evening, filling the electric light globes and gathering in clouds wherever there is a light. Once the flies are established, the larvæ will furnish food for the trout during the six months the water is covered with ice, and the flies will furnish surface food during the rise. I have seen the May fly rising in remote lakes in Canada during the month of September, but nowhere have I seen them in such quantities as on the St. Lawrence. Last season too I mentioned a flight of caddis flies on the St. Lawrence which I observed one evening as I was leaving Montreal; so the river is rich in May and caddis flies.
